

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

MEXICO:

HISTORY AND MODERN DEVELOPMENT.

1. **Mexico, United States of. Geography.**—Mexico is situated between 14°, 30', 42" and 32°, 42" North lat., and between 86°, 46', 8" and 117°, 7', 31", 89 long. west of the meridian of Greenwich, and embraces 18°, 11', 18" of latitude and 30°, 21', 23", 89 of longitude. Its total area is 767,326 square miles, and its boundaries are the United States on the north, Guatemala and Belize on the southeast, the Pacific Ocean on the south and west, and the Gulf of Mexico and the Carribean Sea on the east. Its coast line on the east is 1,727 miles in length and on the west or Pacific side, 4,574 miles. The northern or United States boundary was fixed by treaty 2 Feb. 1848 and 30 Dec. 1853, and extends from the mouth of the Rio Grande, on the Gulf of Mexico, following that river a distance of 1,136 miles beyond El Paso, Texas; thence to a point on the Pacific Ocean, one marine league due south of the southernmost point on the Bay of San Diego. The total length of the northern boundary line is 1,833 miles.

The Guatemalan boundary line was fixed by treaty 27 Sept. 1883 and 1 April 1895; and the Belize line by treaty signed 8 July 1893, and ratified 19 April 1897. The length of the southern boundary of Mexico is 642 miles.

By the treaty of Guadalupe-Hidalgo (q.v.) ratified 2 Feb. 1848, and the Gadsden treaty of 30 Dec. 1853, Mexico ceded to the United States 930,590 square miles of her territory, or 163,264 more than half. The first named treaty involved 362,487 square miles of domain now part and parcel of the United States as follows: Texas, 265,780 square miles; Colorado (in part), 18,000; Kansas (in part), 7,766; New Mexico, 65,201; Oklahoma, 5,740. Under the terms of the second or Gadsden treaty the United States acquired 522,568 square miles, which are now held as follows: Arizona, 82,381; California, 157,801; Colorado (in part), 20,500; Nevada, 112,090; New Mexico, 42,000; Utah, 84,476; Wyoming (in part), 14,320. By virtue of the same treaty a later addition was ceded, consisting of 31,515 square miles to Arizona, and 14,000 to New Mexico, making a grand total of 930,590 square miles of territory, now constituting one of the richest and most productive portions of the possessions of the United States. See GADSDEN PURCHASE; ANNEXATION; UNITED STATES—ANNEXATION OF TEXAS; TERRITORIAL EXPANSION.

Population.—While the population of Mexico has not increased quite in proportion to that of the United States, because, principally, of the very small number of immigrants who have thus far entered her borders, notwithstanding the great productiveness of her soil, the salubrity of her climate, and the many other advantages held out by her, it has steadily advanced, having increased from about 5,000,000 in 1793 to about 6,000,000 in 1810; to about 6,500,000 in 1827; to 7,000,000 in 1839; to 7,853,395 in 1854; to 8,743,614 in 1869; to 9,384,195 in 1878; to 10,791,685 in 1886; to 12,570,195 in 1895; to 13,

607,259 in 1900, and, according to an unofficial estimate, to about 14,000,000 in 1905. According to the government census of 1900, the population of the several states was as follows:

Agascalientes	102,416
Campeche	86,342
Chiapas	360,799
Chihuahua	327,784
Cosahuila	296,938
Colima	65,113
Durango	370,294
Guajuato	1,061,724
Guerrero	479,305
Hidalgo	605,051
Jalisco	1,153,891
Mexico	934,463
Michoacan	935,801
Morelos	160,115
Nuevo Leon	327,937
Oaxaca	948,633
Puebla	1,011,132
Queretaro	233,389
San Luis Potosi	375,432
Sinaloa	296,701
Sonora	221,682
Tabasco	159,834
Tamaulipas	218,948
Tlaxcala	172,315
Veracruz	981,030
Zacatecas	462,190
Tepic	150,098
Lower California	47,624
Federal District	541,516
Yucatan	399,652

Of the total population of 13,607,259 in 1900 there were 6,752,118 males and 6,855,141 females. The percentage of whites, native Indians, and mixed races, may be put down as: Whites, 22 per cent; native Indians, 31 per cent; mixed races, 47 per cent. Of the total foreign population of 57,507 in the same year, 2,565 were Germans; 278, Arabs; 234, Austro-Hungarians; 140, Canadians; 2,721, Cubans; 2,834, Chinese; 16,258, Spaniards; 3,976, French; 3,325, Greeks; 5,804, Guatemalans; 2,845, English; 2,564, Italians; 15,265, North Americans; 391, Turks.

It is altogether probable that Mexico's total population at the close of 1906 was not less than 16,500,000 or 17,000,000. Because of the inaccessibility of large numbers of peons and Indians, the intense dislike of still larger numbers to have their names listed for any purpose of a public nature, and the neglect or inefficiency of many of the persons entrusted with the work of canvassing, no Mexican general census can be depended on as representing more than 80 to 85 per cent. of the entire population. In fact it is safe to assume that in no official statements relating to any department of Mexican statistical information are the figures equal to the facts.

In 1827 the British Minister to Mexico divided the population into these seven classes: (1) Old Spaniards or Gachupines, (2) Creoles or mixed whites of pure European race, born in America and regarded as natives, (3) Indians or indigenous copper colored races, (4) Mestizos or mixed whites and Indians gradually merging into Creoles, (5) Mulattos or descendants of whites and negroes, (6) Zambos or Chinos, descendants of negroes and Indians, (7) African negroes, either

MEXICO—GEOGRAPHY

manumitted or slaves. The first and last three classes he claimed to be pure and to have "given rise, in their various combinations," to the fourth class, which in turn was subdivided many times.

Territorial Divisions.—Mexico is divided into four territorial groups,—the central, the northern, the Gulf and the Pacific. The central comprises the states of Aguascalientes, Durango, Guanajuato, Hidalgo, Mexico, Morelos, Puebla, Queretaro, San Luis Potosi, Tlaxcala, Zacatecas and the Federal District, with a total surface of 143,777 square miles. The northern comprises the states of Chihuahua, Nuevo Leon, Coahuila and Sonora, with a total surface of 254,000 square miles. The Gulf group consists of the states of Campeche, Tabasco, Tamaulipas, Veracruz, Yucatan and the Territory of Quintana Roo, with a surface of 124,913 square miles. The Pacific group consists of the states of Colima, Chiapas, Guerrero, Jalisco, Michoacan, Oaxaca, Sinaloa and the Territories of Tepic and Lower California, with 242,808 square miles of surface. To the total of these four groups must be added 1,560 square miles of surface, contributed by the 21 islands of Guadalupe, Cedros, Santa Margarita, Creciente, Revillagigedo, Tres Marias, Tiburón, Angel de la Guarda, Montague, San Esteban, San Lorenzo, San Jose, Cerralva, Santa Catalina, Monserrate, Carmen, San Marcos, Partida, Cozumel, Mujeres, Espiritu Santo, and a number of smaller ones not generally named in the official reports. The entire surface, including that of the islands, amounts to 767,059 square miles.

Topography.—In the length of coast line the peninsula of Lower California leads with 1,864 miles, Yucatan following with 615 miles, Sonora with 534, Sinaloa 317, Tepic and Jalisco 311, Veracruz 286, Guerrero 286, Oaxaca 255, Tamaulipas 249, Campeche 224, Chiapas 137, Tabasco 119, Colima 99, and Michoacan 81. The greatest length of the republic is from northwest to southeast, 1,942 miles; and the greatest width, east and west, is from the mouth of the Rio Grande to the mouth of the Rio Fuerte, 762 miles, and the narrowest is from the bar at Coatzacoalcas, on the Atlantic side, to San Francisco de mar, on the Pacific,—134 miles.

The gulfs of Mexico, California and Tehuantepec are the principal ones on the Mexican coast, the first named being the largest in the world, and in the commercial development of this continent they have performed and will always perform a most important part. Some idea of their commercial importance may be derived from the fact that in 1903 there entered the gulf ports of the republic, 3,271 steamships and 2,632 sailing vessels, the total tonnage of which was 3,678,583 tons. Mexico's great mass is the lofty Rocky Mountain plateau, which fills it nearly from ocean to ocean, leaving but a narrow strip of coast. Entering from Guatemala (where a spur connects with the limestone and coral table-land of Yucatan), the system trends west, forming a table-land 150 miles wide at Oaxaca, with a steep descent and slender coast on the Pacific, but a more gradual one by terraces to the Gulf in Tabasco and Veracruz. This spreads and swells northward to the vast plateau of Anahuac, 4,000 to 8,000 feet high, where the oceanic relations are reversed, the Atlantic side precipitous and the

Pacific terraced. There is no single range corresponding to the Andes or northern Rockies; the so-called *cordilleras* are merely the outer escarpments of the plateau, though often far above its mean level. Loftiest of these is the Sierra Madre of the Pacific, traceable at a mean elevation of over 10,000 feet from Oaxaca to the United States. It skirts the western coast within 60 or 70 miles to the entrance of the Gulf of California; thence onward a far wider coast land has silted up. Along the Gulf of Mexico are the correspondent cordilleras of Tamaulipas and Nuevo Leon, 6,000 feet in mean elevation; and the southern central plateau maintains its height of 7,000 to 8,000 feet with great persistency to within 40 miles or less of the Atlantic. Through Lower California is a similar ridge some 3,000 feet high. The plateau is no level surface; railroad elevation north from the capital vary by 4,500 feet, declining northward; and the centre is intersected by short secondary ridges and valleys, mostly with the north-northwest trend. Most important of these is the Anahuac Cordillera, surrounding the valleys of Mexico and Puebla; its culminating point is Toluca Nevado ("snow peak"), 15,163 feet. But across this, and generally confounded with it, is a newer transverse ridge from ocean to ocean, traced by five active or recently quiescent volcanoes and several extinct cones, among which are Popocatepetl in the centre, southeast of Mexico City, 17,882 feet; Orizaba, eastward bordering Veracruz state, 18,696 feet; and Ixtacihuatl, northeast of Popocatepetl, 17,338 feet. On the Pacific side is Colima volcano in Jalisco, 12,989 feet; and the line runs out to the Revillagigedo volcanic islands. The sierras of Guerrero, Oaxaca, and Chiapas are nearly parallel to this.

The mountains or peaks of the republic most noted for their great height are, in order of height: Orizaba, in the state of Veracruz, 18,696 feet; Popocatepetl, in the states of Mexico and Puebla, 17,882; Ixtacihuatl, in the same states, 17,338; Nevado de Toluca, in the state of Mexico, 15,163; Malinche, in the states of Tlaxcala and Puebla, 14,643; Cofre de Perote, in the state of Veracruz, 14,042; Ajusco, in the southern part of the Valley of Mexico, 13,075; Colima, in the state of Jalisco, 12,989; Tancitaro, in the state of Michoacan, 12,661; Patamban, in the same state, 12,300; Derrumbadas, in the state of Puebla, 11,801; Ocelatzin, in the state of Puebla, 11,480; Cempoaltepetl, in the state of Oaxaca, 11,139; Lanitos, in the state of Guanajuato, 11,021; Tzirate, in the state of Michoacan, 11,022; Zumate, in the state of Hidalgo, 10,994; Quinceo, in the state of Michoacan, 10,903; Penal, in the state of Puebla, 10,744; Navajas in the state of Hidalgo, 10,289; Laurel, in the state of Aguascalientes, 10,138. Topographically, the mountains of Mexico are exceptionally picturesque and interesting, affording innumerable views which are beautiful in the extreme.

Rivers.—Mexico is not a country of many or large rivers, and a considerable proportion of those appearing on the maps are either wholly or practically dry a part of each year. This is especially true of the northern half of the republic. The more prominent rivers are the Bravo (Rio Grande), which is the northern boundary line of the republic for a distance of 1,097 miles;

MEXICO — GEOGRAPHY

the Panuco, which rises in the mountains of the state of Mexico and empties into the Gulf of Mexico at Tampoico and is 160 miles in length; the Papaloapan, the source of which is in the mountains of Oaxaca and which crosses the state of Veracruz, emptying into the Gulf of Mexico at Alvarado; the Coatzacoalcas, which also has its source in the state of Oaxaca, and crosses the state of Veracruz, emptying into the Gulf at Coatzacoalcas, its length being 186 miles; the Grijalva, which rises in the Chuchumatenas mountains, in the republic of Guatemala, crosses the Mexican states of Chiapas and Tabasco, to the Gulf of Mexico, and is 327 miles in length; the Usumacinta, which also has its rise in Guatemala, crossing the Mexican state of Tabasco and emptying into the Gulf a short distance south of Frontera, its length being 450 miles. Official reports state this to be "the most navigable river in Mexico."

There are also the Tuxpan river, which has its source in the state of Hidalgo, crosses the states of Puebla and Veracruz and empties into the Gulf at Tuxpan, and is navigable for small boats; the Lerma, 457 miles in length which rises in the mountains of Tenango, in the state of Mexico, crosses the state of Jalisco and the territory of Tepic and empties into the Pacific at San Blas; the Balsas, 428 miles long, the source of which is in the state of Puebla and which crosses the states of Mexico, Morelos, Guerrero and Michoacan, emptying into the Pacific at Zacatula, in the latter state; the Yaqui, 391 miles long, which rises in the Tarahumari mountains, in the state of Sonora, and empties into the Gulf of California a short distance below Guaymas; the Fuerte, 335 miles long, which rises in the state of Chihuahua, crosses the state of Sinaloa and empties into the Gulf of California at Bocas de Ahome; the San Pedro, 298 miles; Nazas, 279; Ures, 260, and Sinaloa, 260.

Valleys.—The principal valleys of the republic are those of Toluca, Mexico, Cuernavaca, Puebla, Oaxaca, San Francisco and Orizaba, all of which are extremely rich in soil and most favorably situated as to climate and other conditions affecting their products, which include very nearly every article grown in other parts of the American continent.

Lakes and Lagoons.—As there are no large rivers in Mexico so also are there no large lakes. The principal ones, however, are Chapala, in the state of Jalisco, a beautiful body of water some 51 miles long and 18 miles wide, the shores of which have recently become a favorite summer resort for wealthy residents of Mexico City, Guadalajara and other parts of the republic. Next in extent, and even more beautiful, is Patzcuaro, in the state of Michoacan, around which there clusters a wealth of historic, artistic and poetic interest. Its shores and islands recall those of Lake George in the United States. The other lakes include Cuizco, in the same state, Xochimilco, in the Federal District, Texcoco, in the Federal District and state of Mexico; Tepancuapan, in the state of Chiapas; Tequesquitongo, Coatepec and Hueyapan, in the state of Morelos; Catemaco, in the state of Veracruz; Caivel and Carrintero, in the state of Tamaulipas; Encantado, in Tabasco; Bacular, in Yucatan; Uria, in Guanajuato, and Mexitlan, in Hidalgo. The principal lagoons are the

Terminos, in Jalisco and Michoacan; Tamiahua, in Veracruz, Madre in Tamaulipas; Mexcaltitlan, in Tepic; Coyutlan, in Colima; Tecpan and Coyuya, in Guerrero; Superior and Inferior in Oaxaca; Paras, Coyote and Agua Verde, in Coahuila; Guzman, Jaco, Patos, and Santa Maria in Chihuahua; Chalco, Xaltocan, San Christobal, Zumpango and Lerma in the state of Mexico; Mexitlan and Apan, in Hidalgo, and Santa Ana, in Tabasco. There are numerous other and smaller lakes and lagoons in the republic, which are of much local importance, but which do not appear on the ordinary maps.

Drainage.—The final accomplishment of the enormous task of draining the valley of Mexico, after almost 300 years of more or less spasmodic effort, the loss of hundreds of thousands of human lives, and the expenditure of unknown millions of money is to be credited to the resistless energy and determination of President Diaz, and to the effective aid of American engineers and contractors; American machinery and American capital. These have in a few years solved the problem that had for three centuries defied human effort. Nor were they assisted in the slightest degree by the work of their predecessors, for it was found impossible to utilize this in any practical way. The famous Nochestonge canal,—one of the chief objects of interest to the tourist visiting the republic,—has played no part in the great modern drainage scheme, and never will. The importance of the work recently completed is shown in the facts that the area of the valley drained is about 2,200 square miles; that its entire surface was for cycles of time covered by an inland sea; that originally the City of Mexico consisted of floating structures on the water; that the region affected has been transformed from one of the most unhealthy in the world to one of the most healthy, and that it involved not only the digging of a deep canal many miles in length, but the blasting of a tunnel more than six miles in length, and with a span ranging from 5 feet to 14 feet, through which the sewage of the capital and the drainage of the valley are discharged into the Pacific.

Geology and Minerals.—The foundations of the plateau and the prevailing ones of the higher ranges are granites, overlaid with basalt, trap, porphyry, and recent lavas; in the Valley of Mexico, interspersed with and overlaid by shales, greenstones, silicious schists, unfossiliferous limestone, etc. For 1,600 miles the Sierra Madre of the Pacific forms one of the richest mining districts of the world; its finest part being the western slope, 3,000 to 8,000 feet high. Almost every valuable metal known is here in profusion. Silver was mined by the Aztecs, and has been an important product ever since. Gold is found largely with it, also with copper; the latter exists nearly pure in Chiapas and Guanajuato. There are enormous masses of meteoric iron ore; Cerro de Mercado mountain a mile from Durango, is a solid mass of magnetite. Besides these are lead, antimony, mercury (in cinnabar), zinc, tin, platinum, bismuth, etc., besides sulphur, pumice, asphalt, petroleum, rock salt, alum, marble, gypsum, and other articles, with famous mineral springs. There is also great wealth in gems,—opals, emeralds, amethysts, topazes, agates, garnets, etc. For statistics see article MINES AND MINING.

MEXICO — GEOGRAPHY

Altitudes.—The altitudes of 21 of the more prominent cities of Mexico are as follows:

City.	State.	Altitude, Feet.

Veracruz.....	Veracruz.....	26
Zacatecas.....	Zacatecas.....	8,189

Climate.—The chief natural glory of Mexico is its climate, which, though not as invigorating as that of some other countries, is one of the most delightful in the world. In few localities is there ever intense cold or intolerable heat. It is seldom that death results from freezing, and sunstroke is practically unknown. In the tropics, or hot country, the temperature varies from 77° to 82° Fahr., in the shade, while on the central plateau, which includes the capital city, it is much cooler in summer and warmer in winter than in the United States. In Mexico City the maximum summer temperature in the shade is 85°, and winter temperature 72°; in Puebla, 84° and 75°; in Oaxaca 94° and 83°; in Jalapa 89° and 87°; in Queretaro 90° and 80°; in Guanajuato 91° and 82°; in Pachuca 80° and 77°; in Saltillo 89° and 76°; in Merida 103° and 92°; in Mazatlan 91° and 84°. The official records show the average temperature in Mexico City for five months in 1905 to have been as follows:

	8 A. M.	Noon.	5 P. M.
June.....	59.6	69.7	69.3
July.....	59	69.6	69.3
August.....	57.5	69	68.8
September.....	56.6	67	66.8
October.....	55.5	67.3	67

The average night temperature was 55°. The warmest months of the year, in that city, are April and May,—the last two months preceding the beginning of the rainy season, which there extends from June to November. In the regions near the gulfs and the Pacific ocean, the rains are much heavier and more frequent, and begin earlier and end later. The average rainfall on the coasts is 44 inches and on the table lands 24 inches. In Mexico there are really but two seasons,—the rainy, or summer, and the dry, or winter. The temperature of the spring and autumn months differs very slightly, and the seasons merge into each other quite imperceptibly. The nights are always cool, except in the hot country, where they are seldom uncomfortable, the gulf and Pacific breezes compensating for the heat of the day. There are

no radical or sudden changes of temperature; no prolonged term of heat or cold or storm; and on the table lands all seasons are so nearly alike that most persons wear clothing of the same, or practically the same weight all the year. Except in the northern states artificial heat is seldom provided, either in homes or places of business, even in mid-winter.

In few other countries is to be found such diversity of climate as in Mexico, where the Tropic of Cancer extends across 18 parallels of latitude, and where the altitudes range all the way from 26 feet above the sea at Veracruz, to 8,760 at Toluca, each plateau or step in the ascent illustrating in its fruits and foliage and flowers the marvelous influence of every climatic phase and condition. The white peaks of Orizaba, Popocatepetl and Ixtaccihuatl, which are snow-capped from January to January, look down upon a broad panorama of indescribable beauty to be seen only in this land of perpetual spring. Only in the states of Chihuahua, Durango, Zacatecas, Mexico, and possibly one or two others, and on the uninhabitable mountain heights do frosts ever occur. The summer rains on the upper plateaus simply intensify the green of the verdure, increase the number and beauty of the flowers, develope the fruits, sweeten the atmosphere, and drive away disease. Here the sun's rays are perpendicular, and in the middle of the day are very intense. In the shade, however, it is never uncomfortable.

Flora.—The physical conformation of Mexico is most favorable to the development of a wonderfully rich and varied economic flora. In the hot lands or coast regions, from the sea level to an altitude of 1,500 or 2,000 feet, coconuts, cacao, vanilla, peppers, nutmegs, ginger, cloves and other spices and all the fruits of tropical countries are successfully and profitably grown; while sugar cane, coffee, rice, cotton, tobacco, hemp, oranges, lemons, limes, bananas, mangoes, apples, peaches, papayas, pears, plums, figs, cherries, grapes, zapotes, pineapples, mameys, pomegranates, yams, sweet potatoes, Irish potatoes, most of the edible roots, and, in fact about all the varieties of fruits and vegetables grown anywhere are found and successfully cultivated in altitudes up to and including the Valley of Mexico, 7,000 feet above the sea. The same is true of wheat, corn and most of the grains of commerce, the greater proportion of which reward the husbandman with liberal crops of excellent quality, frequently, in some of the states, twice or three times in a year,—notably in Veracruz, Tabasco, Chiapas, Oaxaca, Guerrero, Michoacan, Jalisco, Mexico and possibly one or two others. In Mexico there is no legitimate excuse for neglectful or indifferent cultivation of the soil, as the laborer may, if he will, comfortably employ his time in the fields every working hour of every day in the year. Here there is a favorable climate and suitable soil for every known grain, fruit, vegetable or plant. That these conditions have been utilized, even though in a more or less imperfect manner, is evidenced by the statement of a recognized authority, that 52 species of cereals and vegetables, 87 of fruits, 100 of odoriferous flowers, 56 of building woods, 21 of cabinet woods, eight of gums, three of resins, 12 of forages and 113 of medicinal plants here thrive and reach a high degree of perfection.

Flowers of almost innumerable variety from the gorgeous orchid of quaint and curio form and wonderful combination of colors, the modest daisy, violet and tuberosa, grow in and in extravagant profusion all the year round in the range of altitudes meeting the requirement of all the members of the floral kingdom. flower markets of Mexico City, which are supplied from the Chinampas or historic "floating gardens" established by the Aztecs on the surface of lake Tuxcoco before the coming of the Spaniards, are among the objects of interest most enjoyed by the visiting tourist, and frequently testify to the beauty and brilliancy of the Mexican flora. This country has been deservedly named "the land of flowers," for everywhere and all the year there are flowers of every hue and color.

In the forests of the republic, especially in the tropical states, are found many varieties of trees the timber of which possesses great value for building or cabinet purposes. These include pine of several varieties, balsam, lignum vitae, red cedar, mahogany, oak, rosewood, zquite, olive, palm, almond, fir, sesame, cedar, cypripine, turpentine pine, india rubber, copal, 12 species of dye woods and 17 varieties of oil-bearing trees. The arboreal vegetation of the country embraces 114 different species of woods.

Fauna.—Included in the fauna of Mexico are the American lion or numa, jaguar, ocelot, wildcat, wolf, coyote, bear, wild dog, bison, sloth, monkey, hare, rabbit, squirrel, armadillo, deer, beaver, otter, mole, marten, lizard, turtle, which are principally found in the sparsely settled mountains and in the forests of the tierra caliente. None of these are mounted, the Indians of the country having little or no taste for this kind of sport.

In the tropics there are many varieties of rich plumaged birds, and song birds are found in all altitudes. Parrots and parakeets abound in the coast regions and are highly prized for their talking qualities and brilliant colors of green, yellow and red. Among the many species of song birds may be mentioned the zenzontla or singing bird, the clarin and the nightingale. Birds of prey include the eagle, hawk, turkey buzzard and owl. Then there are the crow, the talking lory, the humming bird, crow, blackbird, turtle dove, woodpecker, swalt, magpie, heron, falcon, kite and great number of others, which inhabit the forests or fields where there is abundance of insect and other food for their sustenance. To give the names of these would require much space. In localities where there are fresh water lagoons, ponds or rivers there are great numbers of wild ducks and many geese, and in the forests the wild turkey abounds. Wild bears are numerous, and the Indians derive quite a income by securing their honey and marketing it in the cities and towns. Of domestic or half-wild fowls the number and variety are very extensive, and their consumption by the people of the country is enormous. Until the Spaniards came all such fowl were unknown.

The waters of the Mexican gulfs, lakes, and rivers are well stocked with many varieties of fish of excellent quality, the most prized being the red snapper. The markets of Veracruz, Tampico and other cities daily display a

tempting supply and variety from the gulfs, the Pacific and the accessible rivers, and large quantities are shipped to inland points by railway, in refrigerator cars. In the immediate vicinity of Tampico many tarpon of large size are caught.

Of reptiles there are many varieties, both venomous and harmless, especially in the southern forests. In the first named class are included boas, covals, and rattlesnakes. Then there are many varieties of scorpions, tarantulas and lizards, some of the latter being so large as to be utilized by the natives as an article of food, and at least in size, but not the least dreaded, is the mosquito.

ELISHA HOLLINGSWORTH TALBOT,
Author of 'Commercial and Industrial Mexico at the close of 1906.'

a. Mexico—Archæology. One of the many crimes committed by the conquerors of Mexico in the early period of their success was the wanton destruction of a great part of the Aztec hieroglyphs (picture writings), monuments, and temples which constituted the only recorded or connected history of the country, its laws, its people, and their customs and habits, their achievements, learning, ambitions, and superstitions,—a civilization antedating almost all others of which the world has any exact knowledge. And the greater was the shame because perpetrated in the name of Christianity. But, fortunately, enough was left and is being carefully preserved on which to build a wonderfully interesting and instructive superstructure of fact and conjecture that can, with reasonable confidence, be accepted as true.

Since 1773 there has been shown constant and most praiseworthy desire by the government of the country and the various historical and scientific organizations to strengthen this necessarily incomplete record. The work of exploration has been prosecuted more or less systematically and earnestly for many years, and discoveries of the greatest importance have, from time to time, added priceless treasures to

the rapidly filling storehouse. To Emperors, not so ancient as Uxmal, the ruins of Palenque, Iturbide and Maximilian seems to be due the credit for having taken the only practically effective steps following those of Viceroy Don Antonio Maria de Bucareli y Ursua, in 1775, looking to the preservation of these treasures, among which the more notable are the great Calendar Stone; the Sacrificial Stone; the head, in stone, of Totec and that of Huizilopochtli in clay, the statues, in stone, of Quetzalcoatl (God of Air); the Goddess of Water, (the Fainting Stone); Coatlicue, the Toltec Atlantis; Chac-Mol, (the Tiger King); Mixcoatl, (God of Fire and of the Chase); Izoauhqui, (Sun God); El Indio Triste, (the Sad Indian); a number of stone vases for receiving the blood of sacrifices; Tzontemec (Vase of the Sun), used for receiving human hearts, the Goddess of Death; the Rock of the Famine; the God of Agriculture; Cihuacoatl, (the Woman Serpent); the Goddess of Music; numerous crosses and symbols in stone; Tlaloc, (the God of Rain); a collection of Aztec funeral urns; Mictlantehuilli, (the God of Death); the Yoke of the Sacrifice; examples of Aztec pottery and terra cotta idols; Zapotecan and Tarascan pottery; idols and jewelry of gold, and an extensive collection of musical instruments and Indian paintings.

That great numbers of other treasures than have been assembled here still lie buried under the paved streets and ancient edifices of the capital and in innumerable places in other parts of the republic, awaiting discovery, is not doubted. Several very important objects were unearthed quite recently by workmen employed in excavating in connection with the city's drainage system. Some of these are of enormous size and were elevated to the street surface with much difficulty. There is an official commission for archaeological investigation, and without doubt the government will devote earnest and unremitting effort toward further and systematic explorations, as soon as it can find time from the exacting demands of the present unparalleled period of industrial development. What with the ruins of the Casas Grande, in northwestern Chihuahua; of Chichimec, near Durango; of La Quemada, southwest from Zacatecas; of Teul and Juchipela, in the extreme southern part of the same state; of Mitla, in the state of Oaxaca; of the Sepulchres of Xoxo; the Fortifications of the Peñon de Mitla and Monte-Alban; the relics of Temples, Palaces, and Tombs of Chichen Itza and Uxmal, in Yucatan; the Palaces at Palenque, in Chiapas; the Temples on the Usumacinta river, and the ruins, pyramids, tombs, idols, ancient pottery, etc., of Tlaxcala, Puebla, Veracruz, Morelos, Guerrero, and Hidalgo, there is in Mexico a most inviting field for the archaeologist and ethnologist. In fact, there are many sections of the country which have not yet been even cursorily examined, much less systematically explored. In Yucatan, Oaxaca, and Campeche there are well-organized archaeological museums, and others will be established in other state capitals as the work of exploration progresses. By some writers it is claimed that Uxmal, near which the City of Merida, in Yucatan, is situated, and the ruins of which are among the most ancient and interesting in Mexico, was built by the Mayas and was the cradle of the world's civilization. Although

not so ancient as Uxmal, the ruins of Palenque, in the state of Chiapas, the Pyramid of Cholula, near the city of Puebla, the two great pyramids of Teotihuacan, 25 miles northeast from the City of Mexico, and the Palaces of Mitla, 100 miles southeast from the city of Oaxaca, all date by a long period of time, the coming of Cortes.

So closely connected with the archaeology of a country is its ethnology, that it seems most appropriate to introduce in this article some statistics regarding the interesting and unusual mixture of races, languages, temperaments, tastes, and other characteristics of the people who populated Mexico. From the icebound realms of the far north, from the extremes of Alaskan winters and the torrid summers of the south, they came,—Iberians, Semites, Huns, Goths, Romans, Celts, and Vandals,—to a compromise ground,—this country where there are no extremes and where existence not dependent upon artificial protection or stultification. It has been asserted by a noted author that in the composite population of this country "is mingled the blood of more races than in that of any other nation on earth." According to the Curator of the Division of Ethnology of the United States National Museum the linguistic families of Mexico consist of 14 divisions, the census of which, in 1895, is as follows: Nahuatlans, 1,750,000; Piman, 800,000; Yuman, 2,500,000; Serian, 200,000; Tarascan, 200,000; Zoquean, 60,000; Totonacan, 90,000; Zotecan, 580,000; Otomian, 704,734; Otomian of certain), 5,000; Mayan, 400,000; Tequistlatecan, 31,000; Huevan, 3,800; Athapascan, 8,000; total, 3,970,234. These linguistic families are distributed as follows: Nahuatlans, or Mexicans, in the states of Aguascalientes, Colim, Guerrero, Hidalgo, Jalisco, Mexico, Michoacan, Morelos, Oaxaca, Puebla, Sinaloa, Tabasco, Tlaxcala, Veracruz, and in the Federal District; Piman, in the states of Chihuahua, Durango, Coahuila, Sinaloa, Sonora, and Zacatecas; Yuman, in the northern part of the territory of Lower California; Serian, in the state of Sonora, and on the Tiburon Island; Tarascan, principally in the state of Michoacan, with a few in Guerrero and Jalisco; Zoquean, chiefly in Oaxaca, and a less number in Guerrero and Puebla; Totonacan, in the northern part of the states of Puebla and Veracruz; Zapotecan, chiefly in the state of Oaxaca and a small number in Guerrero and Puebla; Mayan, in the states of Yucatan, Chiapas, and Veracruz; Tequistlatecan, in the state of Oaxaca; Huevan, in the state of Chiapas; Otomian in the states of Guanajuato, Hidalgo, Queretaro, San Luis Potosi and Michoacan; Athapascan, in the states of Chihuahua and Sonora. The last mentioned family is composed of intruders from the United States and includes the troublesome Yaqui tribe.

Mexico, which may be termed the Egypt of the American continent or New World, holds within her borders innumerable sculptures which bear striking resemblance to those of the Egypt of Pharaoh. On the walls of ancient temples and palaces, on statues of her gods, on idols large and small, and on many other objects which have been decorated by the hands of her ancient artisans, there is to be seen unmistakable evidence of Egyptian origin. The age of the civilization which pro-

.

MEXICO—HISTORY

duced the archaeology of this country in which centuries are considered as if only years, and which possesses such wealth of interesting antiquities, is necessarily more or less a question of conjecture, and must always so remain. So great is the diversity of opinion on this subject, among writers and authorities, both ancient and modern, that its study becomes more and more confusing with each step of its progress. Alfredo Chavero, the able Curator of the National Museum of Mexico, to whom belongs the honor of having suggested the "American Archaeological and Ethnological Commission" created in Washington in 1902, and who is unquestionably the greatest Mexican authority regarding the archaeology and ethnology of the country, dates the origin of Toltec civilization, from 3,000 to 4,000 years before Christ. Not less confusing are the various theories as to the number and variety of indigenous tongues spoken, or as to the sources from which came these incongruous races; one writer placing the number of theories regarding the latter, at 16. Of two presumed authorities, one gives the number of tongues as 108, and the other as 150. Regarding the origin of these tongues, there is equal diversity of opinion; the range of location including Egypt, China, Asia, the Island of Atlantis, and Africa. Humboldt believed that Mexican civilization was borrowed from Asia; Hernandez and Acosta, that the country was peopled from the Old World, in antediluvian times; Sigüenza, that the Mexicans were the direct descendants of Naphtuhim, son of Mizraim and grandson of Noah, who, according to tradition, migrated from Egypt to Mexico following the confusion of tongues; Lord Kingsborough devoted a fortune in a persistent effort to prove that the original Mexicans were recruited from the lost tribes of Israel; and another great student of ancient history asserted that "the original peopling of America may well date from the time when there was continuous land between it and Asia."

When recently some workmen were excavating in the courtyard of the National Palace of Justice, they unearthed one of the most remarkable and important statues yet discovered,—a crouching ocelot or native tiger,—which Mrs. Nuttall, a noted archaeologist, describes as "the finest piece of animal sculpture that has as yet been found on the American continent," and which she asserts "must have been considered an image of the god Tezcatlipoca." The carving on this statue, which includes two seated human figures surmounted by feather head dresses, appears to have been done in the year 1480.

The greatest of the pyramids of Teotihuacan is that of Tonatiuh (the Sun), which is larger at the base than any of the pyramids of Egypt, though not quite as high as the highest of these. It is 761 feet square at the base, 216 feet high, and has three separate terraces. Its summit is 75 feet square. It has been found that at different periods successive kings or rulers added greatly to the size of this pyramid, while carefully preserving its proportions. The last of these additions, the surface of which had been made rough and somewhat irregular by time and the elements, is now being removed by the government, at an estimated expense of \$1,000,000, exposing to view the smooth, hard surface of the one last preceding. It is related that

Cortes supposed this and its companion pyramids to be natural hills or mounds, so great was their size. As further evidence of the enormous proportions of many of the more notable examples of Mexican archaeological antiquities, it may be stated that the great calendar stone is 11 feet, 8 inches in diameter, weighs 53,792 pounds, and required the combined strength of 5,000 men to remove it from Coyoacan, where it was carved, and that the famous Sacrificial Stone, which was discovered in 1791 near the Cathedral of Mexico City, is eight feet in diameter, and almost three feet high. The statue of the Goddess of Water is 10 feet, 5½ inches in height, and 5 feet, 5 inches wide at the base, and weighs 18 tons; the statue of Coatlicue is eight feet high and five feet in diameter, and the colossal head of Totec is three feet high, over two feet wide, and about seven feet in circumference. Most of the pyramids, fortifications, and temples, from the ruins of the Casas Grande in the border state of Chihuahua, on the north, to the Palaces of Chichen Itza in Yucatan, on the south, convey to the mind a sensation of profound awe by their great size and the evidences of magnificence, artistic taste and symmetrical beauty shown in their planning and construction. For example, there are two cap stones at Mitla, on a wall 20 feet high, each of which is 19 feet 6 inches long, five feet wide, and four feet thick, and estimated to weigh 67,000 pounds.

3. **Mexico—History.** The true history of Mexico, unsullied by prejudice, wholly free from misinformation and complete in the presentation of details, in conclusions reached, and in both praise and criticism, is yet to be written. In order to collect the materials for and prepare such a history, its author must devote years of residence in the republic; must personally visit and exhaustively study every state and territory within its boundaries; must thoroughly investigate its ruins and other long-buried evidences of a civilization regarding which too little is known; must exhaust the long-neglected, musty tomes of public and private libraries; must know how to sift the wheat from the chaff; must be able to distinguish truth from fiction, the reasonable from the unreasonable, and must attune himself to the customs, traditions and sentiments of the people of whom and of whose fair land he would write. It is not sufficient to read existing histories, interview a few wise men, visit the National Museum, stroll through the National Library, and study the natural characteristics of the country and its people, from the windows of a fast moving railway train. Of materials for a history that shall neither prove misleading nor inspire prejudice there is ample store within easy reach of the mind able and disposed to make right use of it.

MEXICO — HISTORY

But the proper accomplishment of the task will involve the production of many volumes and the undoing of much that has been done in the past, which had not been well considered or fully proven.

The history of Mexico dates back to about the year 600 A. D., according to generally accepted tradition; but from that period until 1596, there is not known to have existed any record of the conditions or events which filled the intervening time,—530 years of Toltec and other civilizations that may have exceeded in wisdom and splendor all that followed. It has been asserted that back of all recorded history, and contemporaneous with the antediluvian fauna or with the prehistoric man of the old world, was the first appearance of his counterpart on this continent. But we have principally to consider here the more important incidents in the recorded history of this wonderful country; its growth and development; its alternating periods of good and evil import; its part in the affairs of the family of nations, and the circumstances in its national life which relate more directly to its past, present, and future career as a nation.

Name and Early History.—Mexico derived its name from that of a group of American Indian tribes known as Mexica or Azteca, which entered the valley now teeming with a prosperous population of almost a million souls, in the 12th century; later, or about the year 1325, laying the foundations of the present capital. They had penetrated the country as far as Tula, 50 miles north of Mexico City, as early as 1160, where they remained almost 130 years, or until 1325, when the advance southward was renewed, terminating permanently on the shores of Lake Texcoco, in the heart of the mountain enclosed valley. But the Aztecs were not the first to arrive, having been preceded by the Toltecs, who came from the far north, according to tradition, in the 8th century; some writers placing the time as early even as the 6th century. What is known as the Aztec period was really not inaugurated until about 1430, and the name Mexico was not formally given the country until after the arrival of the Spaniards, by whom it was coined from the sources named above. Between the 8th century and the founding of the city in 1325, wars, famine, pestilence, human sacrifices, jealousies, conflicting ambitions, and other afflictions which must have greatly reduced the population and retarded all manner of progress, seem to have followed each other in rapid succession. In the 145 years ending with the coming of the Spaniards in 1521, 10 successive kings ruled the Aztecs; and between 1521 and 1821, in which latter year the Spanish yoke was thrown off, the country was ruled, in turn, as New Spain, by five governors, two royal commissioners, and 61 viceroys.

Mexico became part and parcel of the already existing group of American territories in 1540, adopting the name New Spain, and at once passing under the domination of viceroyalty represented, in a little less than 300 years, by some 60 viceroys, whose chief purpose seems to have been the robbery of the mines and of the people for the benefit of themselves and the Spanish government. Not until 1808 did Mexico awake to a full realization of the debasing and humiliating conditions that had been bequeathed by Spain and most cruelly enforced

and perpetuated by her conquerors, through almost three centuries of intrigue and oppression, panoramic changes of government, and successive revolutions that effectually stifled all hope or possibility of material or intellectual advancement. From 1810, in which year the patriot Hidalgo (q. v.) took up arms in a determined and desperate resolve to rid the country of Spanish oppression, to 1821, when success was finally achieved, not even the terrors of the Inquisition, nor the fear of violent death, was sufficient to turn back or even seriously check the tide of patriotic effort. During this period, both Hidalgo and Morelos (q. v.), who were successively the greatest leaders of the revolt against Spanish rule, were executed, and many thousands of their faithful followers sacrificed their lives to the great cause. Between 1821, in which year the independence of Mexico was formally acknowledged by Spain, and 1884, when Porfirio Diaz (q. v.) became President a second time, succeeding Manuel Gonzalez (q. v.), who had himself succeeded Diaz, 67 years of alternating revolutions, conflicting policies, disorder, political scheming, conflict of arms, uncertainty, and financial discredit at home and abroad, had passed,—a brief period, as time is computed in the making of history,—yet long enough to include, in its rapid procession of events, the establishment and brief existence of a regency and an emperorship by Iturbide (q. v.); the proclaiming of a republic by Santa Anna (q. v.), followed by a provisional government; the abdication and flight to England of Iturbide; the return of Iturbide and his execution, the adoption of the first liberal constitution and the election of Don Felix-Victoria, as the first President under its provisions; the contested presidencies of Pedraza, Guerrero, and Bustamante; the reaction of the Church party, the abolition of the constitution of 1824, the fusion of Confederate States, with Santa Anna as President or Dictator; the cession of Texas and capture of Santa Anna; the return of Santa Anna and his resumption of the presidency; the election of Bravo (q. v.) as President; the Dictatorship of Santa Anna; the restoration of the constitution of 1824; the second re-election of Santa Anna to the presidency and his subsequent banishment from the country; the successive presidencies of Canaliza and Herrera; the war with the United States to recover Texas; the ceding of two-fifths of Mexico's possessions to the United States; the second Dictatorship of Santa Anna; the ceding of more territory to the United States; the flight of Santa Anna; a period of provisional government under Comonfort (q. v.) as President; the rupture with Spain; the adoption of another constitution and its subsequent suspension; the Dictatorship of Comonfort; the inauguration and success of the War of Reform; the deposition of Comonfort by Zuloaga; the abdication of Zuloaga (q. v.) in favor of Miramon (q. v.); the supplanting of Miramon by Zuloaga; the recognition of the Juarez government by the United States; the capitulation of Guadalajara to Juarez; the flight of Miramon; the success of the liberal government; the triumphal entry of Juarez (q. v.) into Mexico City; the confiscation of \$175,000,000 worth of church property and fully one-third of the land of the country by the Juarez government; the final separation of Church and State; the occu-

MEXICO—HISTORY

pation of Veracruz by Spain, France, and England as a means of enforcing payment of losses incurred by certain of their subjects; settlement of the claims of Spain and England; the occupation of Mexico City by the army of France; the acceptance of the crown by Archduke Maximilian (q.v.); the withdrawal of the French and the abandonment of Maximilian by Napoleon; the execution of Maximilian at Queretaro; the election of Juarez to the presidency, and his subsequent death; the presidency of Tejada; the amending of the constitution; the first election of President Diaz; the election of Gonzalez, and the second election of Diaz, who has held the high office through successive elections ever since. Truly, a remarkable series of momentous events to have occurred in so brief a period of time. In order that the reader may fully understand and appreciate the political condition existing in Mexico during the period covered by the successive Regencies, Empires, Dictatorships, and Republics through which she has passed, it is important to consider the transient, and uncertain tenure of their duration, which is shown in the following table:

Years.	Names.
1821-1823	First, Don Augustin de Iturbide, Don Juan O'Donoy, Don Manuel de la Barcena, Don Isidro Yañez, and Don Manuel Velasquez de Leon; Second, Don Augustin de Iturbide, Don Isidro Yañez, Don Miguel Valentin, Count de Casa de Heras, and Brigadier General Don Nicolas Bravo.
1823-1823	Don Augustin de Iturbide, with title of Augustin I.

REGENCIES.

Years.	Names.
1823-1824	A council with supreme executive power, composed of Don Nicolas Bravo, Don Guadeloupe Victoria, and Don Pedro Negrete, with Don Jose Maria Michelena, and Don Miguel Dominguez as substitutes.

PROVISIONAL GOVERNMENT.

Years.	Names.
1824-1824	Gen. Guadeloupe Victoria.
1829	Gen. Vicente Guerrero.
1829	Don Jose Maria Bocanegra.
1829	Don Pedro Velez.
1829	Gen. Luis Quintanar.
1829	Don Lucas Alaman.
1830-1832	Gen. Anastasio Bustamante.
1832	Gen. Melchor Musquiz.
1832-1833	Gen. Manuel Gomez Farias.
1833	Don Valentin Gomez Farias.
1833	Gen. Antonio Lopez de Santa Anna.
1833-1834	Don Valentin Gomez Farias.
1834-1835	Gen. Antonio Lopez de Santa Anna.
1835-1836	Gen. Miguel Barragan.
1836-1837	Don Jose Justo Corro.

CENTRAL REPUBLIC.

Years.	Names.
1837-1839	Gen. Anastasio Bustamante.
1839	Gen. Antonio Lopez de Santa Anna.
1839	Gen. Nicolas Bravo.
1839-1841	Gen. Anastasio Bustamante.
1841	Don Javier Echeverria.

DICTATORSHIPS.

Years.	Names.
1841-1842	Gen. Antonio Lopez de Santa Anna.
1842-1843	Gen. Nicolas Bravo.
1843	Don Valentin Canahzo.

CENTRAL REPUBLIC.

Years.	Names.
1844	Gen. Antonio Lopez de Santa Anna.
1844	Don Valentin Canahzo.
1844-1845	Gen. Jose Ignacio Herrera.
1846	Gen. Mariano Parades y Arrillaga.
1846	Gen. Nicolas Bravo.

FEDERAL REPUBLIC.

Years.	Names.
1846	Gen. Mariano Salas.
1846-1847	Don Valentin Gomez Farias.
1847	Gen. Antonio Lopez de Santa Anna.
1847	Gen. Pedro Maria Anaya.
1847	Gen. Antonio Lopez de Santa Anna.
1847	Don Manuel de la Pena y Pena.

Years.	Names.
1847-1848	Gen. Pedro Maria Anaya.
1848	Don Manuel Pena y Pena.
1848-1851	Gen. Jose Joaquin de Herrera.
1851-1853	Gen. Mariano Arista.
1853	Don Juan B. Ceballos.

DICTATORSHIPS.

Years.	Names.
1853	Gen. Manuel Maria Lombardini.
1853-1855	Gen. Antonio Lopez de Santa Anna.
1855	Gen. Romulo Diaz de la Vega.
1855	Gen. Martin Carrera.
1855	Gen. Juan Alvarez.
1855-1857	Gen. Ignacio Comonfort.

CONSTITUTIONAL PRESIDENTS.

Years.	Names.
1857-1857	Gen. Ignacio Comonfort.
1858-1861	Don Benito Juarez.
1861-1872	Don Benito Juarez.
1872	Don Sebastian Lerdo de Tejada.
1872-1876	Don Sebastian Lerdo de Tejada.
1876	Gen. Porfirio Diaz, with Gen. Juan N. Mendez, as substitute.
1877-1880	Gen. Porfirio Diaz.
1880-1884	Gen. Manuel Gonzalez.
1884-1911	Gen. Porfirio Diaz.
1857-1860	The Conservative party governed in the capital, during which period the presidents were as follows:
1857	Gen. Felix Zuloaga.
1858	Gen. Manuel Robles Pezuela.
1858	Don Jose Ignacio Pavon.
1858	Gen. Miguel Miramon.
1859	Gen. Felix Zuloaga.
1859-1861	Gen. Miguel Miramon.
1864-1867	Imperial government of Archduke Maximilian as Emperor.

Recent History.—For a month in the fall of 1910 the centenary of Mexican independence was celebrated, the leading nations of the world taking part in the ceremonies, but hardly had this period come to an end when sedition broke out among the people and throughout Mexico for two months there were sporadic attempts at securing the presidency for Francisco I. Madero which his followers believed he had been cheated out of. If it had not been for the fact that the revolutionists were scattered and were unable to cover great distances with the railroads under the control of the government, Madero's party might have been able to meet with success, and if Diaz, who was 80 years old at this time, had died, Madero's chances would have been considerably increased.

Madero and his followers insisted that they were not attempting to overthrow Diaz, but were centering their attacks on the political body which had attached itself to him and was fattening under his protection. Madero is independently wealthy and a man highly thought of in Mexico, but he received less support than would have been the case, if Diaz had not remained to make it seem like an act of ingratitude against the man who had unquestionably made Mexico what it is to-day.

The centenary ended with September, and early in November revolution broke out. To the rest of the world this seemed sudden and unexpected, but the activities of the revolutionary junta had long been known, arms had been imported and ammunition secured. Madero made his attack from the borders of Texas and Arizona, much as Diaz had himself done in 1876, when as revolutionist, he took up arms against President Benito Juarez and his two successors, Lerdo de Tejada and Iglesias. The Juarez government was, however, thoroughly discredited, and Diaz was received with sympathy by all classes. In his time Diaz appeared as a strong figure, able to seize a serious situation and force the country, long wasted by warfare and crime, into the ways of peace. The

MEXICO

Mexican people trusted to his ability and he realized their hopes. Mexico thrived as never before and, although it was necessary to give valuable concessions, the resources of the country were developed by foreign capital. Among the more ignorant there has always remained a feeling against the Americans in Mexico, but the people generally have not been slow to see the economic advantages accruing from having the mines developed, railroads built, etc.

Until 1904 Diaz was elected always without question or opposition and gave the country a better government than anyone else had ever been able to bring about. But at that time, being 74 years of age, he wished to transfer some of the burden of government on other shoulders and secured the election of Corral of Sonora, as vice-president, a position having been provided for him by a change in the constitution. The people were not in favor of Corral, but had become so accustomed to accepting the will of the President that no serious opposition was offered.

Corral's period of office ended in 1910, when the next election took place, and, Diaz having stated that he would retire at this time, it was anticipated that an entire change of government would be possible. Long before election, however, Diaz disillusioned the people and also made it plain that he wished Corral to be elected with him. This meant that Corral would probably succeed to the presidency during the following six years, and to this there was a strong objection. Many Mexicans were not in favor of what practically amounted to Diaz choosing his own successor in office. General Bernardo Reyes, Governor of Nuevo Leon, was proclaimed by a new party for the vice-presidency, but before the election period arrived, he resigned his post and was sent to Europe on a mission which was clearly designed to secure his absence.

At that time the party supporting Madero took form and Medero appeared on the stump in his own behalf. For this he was arrested by Diaz charged with arousing sedition among the people, and he was still in jail when the election took place. Under these circumstances, with the country strongly in favor of Diaz, in spite of his domineering ways, there was no question as to the election of the Diaz ticket, and Medero was only released from prison when the matter was entirely settled and it was thought he could cause no trouble. First he was released on bail and later exiled. Going to San Antonio, Texas, he found other Mexicans who were waiting for the first chance to cause a revolution, and they persuaded him to take the leading part, which he was ready to do. In taking up the sword against the government, Madero made it plain many times that he did not desire the overthrow of Diaz so much as the government which had grown up about him and taken advantage of his weakness and old age to exploit the country in their own behalf.

The incidents of the revolution were too complicated to be well understood outside Mexico, and were frequently accompanied by anti-American demonstrations which made it appear that the malcontents were anxious to deprive the Americans of their property rights, which had developed into many millions.

The first signs of disturbance were in Vera Cruz, where bandits attacked the American planters, and upon presentation by United States Ambassador Henry Lane Wilson, troops were sent to quell the disturbance. As early as the middle of October the rurales killed the bandit king, Santanon, scattering his following.

The outlaw, Alfredo Villa, and his band, who made their rendezvous in the mountains of Curango, enlarged their field of operation at about this same time and invaded the ranches of Parral. At this time both Villa and his henchman, Claro Reza, fell in love with the same girl, and Reza carried her off to Parral, where he was arrested and sentenced to prison for his crime. Receiving a threat of death from Villa, he was allowed to entice Villa to civilization. This was done at Chihuahua, but in the encounter Reza was killed and Villa again escaped. After a period of devastation, Villa appeared in Parral after night and was betrayed by a woman he had come to see.

The bold actions of the bandits were but an indication of the unrest, and on 9 November, a sudden outbreak against Americans took place in the City of Mexico, which was meant as an indirect attack on the administration for permitting Americans to obtain so strong a foothold in Mexico. As a demonstration against Americans it was not important, but showed the disposition of the people to pick on anything which gave them an opportunity to vent their dissatisfaction. They stamped on the American flag, stoned the offices of the *Mexican Herald*, and on the second night American business houses were attacked and a flag torn down from a candy store. Mexican papers published violent attacks on the Americans.

The immediate cause of the demonstration was the burning at the stake of Antonio Rodriguez at Rock Springs, Texas, Rodriguez having confessed to killing Mrs. Lem Henderson. The burning took place 3 November. Throughout Mexico Americans were in peril on this account for a number of weeks. An attempt was even made on the life of Ambassador Wilson and for a time the riots attained such proportions that several Mexicans were shot down by the police. Such bitter feeling was caused that a boycott against the United States was decided upon, but, the revolution making headway, attention was gradually diverted in that direction.

For a time Guadalajara was the storm centre and Carlos B. Carothers, who shot two men in the crowd attacking his house, was thrown into jail. The situation became serious there for a few days, but here, as elsewhere, the strong hand of Diaz stopped the rioting before it had fairly begun.

At the height of this trouble word reached Diaz that Madero was about to cross the Mexican frontier with a strong following, bent on taking advantage of the psychological moment in securing an overthrow of the government. At the same time incipient revolutions broke out in 12 of the southern States, and it soon became obvious that a general uprising was planned.

The revolutionists, naming themselves anti-reactionists, made their first open avowal of revolution at Puebla, and a clash between them

MEXICO

and Mexican troops took place 17 November. This, with the uprisings in the south, were premature, as the date fixed was Sunday, 20 November. At this time circulars began to appear throughout Mexico sent from San Antonio, containing the declaration, "I, Francisco I. Madero, will place myself at the head of a revolutionary party against the Government of Mexico. Between the 20th and 30th of November I shall lead my followers against the Government of Mexico."

The next day a serious rebellion came to a head in Puebla and 170 were killed. The fight centered about the house of Aquiles Cerdan, who had taken refuge in a tunnel. Otherwise the town was comparatively quiet. A large body of revolutionists were at Cerdan's house discussing plans when attacked, thus bringing on a serious revolution two days in advance.

On 19 November, Madero crossed the Mexican border and declared himself in open rebellion. The critical points were Laredo and Eagle Pass, and the Mexican Gen. Lauro Ville concentrated his forces at Nuevo Laredo. Simultaneously malcontents crossed the Mexican border from one end of the border to the other in small bands, ready to resist governmental forces. Within two days there was serious fighting at Durango, Torreon, Parral, and Gomez Palacio, the last-named town falling into the hands of the rebels, and 300 Federal troops joining the revolutionists. The Mexican Government immediately took possession of the telegraph and the railroads and prevented rapid spread of the revolution. Madero was slightly wounded, 24 November, in a fight between his forces and 200 rurales at Guerrero. At the same time Madero's real estate interests were confiscated, and ammunition and arms bound to revolutionists were seized at San Pedro, Monterey, Santa Barbara, and other points. The victory at Gomez Palacio was also turned into defeat by the arrival of 1,000 men with field pieces from Torreon, who retook the town and killed many revolutionists. Nevertheless it was appreciated that the government was face to face with a serious situation and there was fighting in seven States. The revolutionists had managed to secure field pieces and ample ammunition, and, in the mountainous country, were able to hold their own and carry on at least a guerrilla warfare. The barracks and prison at Orizaba were attacked and prisoners freed on the night of 21 November. This was one of the best planned and best executed movements of the revolutionists, but they were driven back by the Fifteenth Mexican Infantry after a hot fight. Troops were hurried from every direction, and it was realized that real revolution was in progress. Within a few days however, the Maderists met with serious reverses at Chihuahua and in the south, and it was apparent that the governor, having the facilities of communication in hand, was in a position to quell the outbreak, in spite of the extent of popular sympathy.

At the height of the rebellion, 1 December, President Diaz was inaugurated and took occasion to assure the world that peace would soon be restored. He took the position that it had been practically restored already. It had become known, meanwhile, that Madero

was but slightly injured and entirely recovered and his followers were in a fortified position near Chihuahua. It was found that 90 per cent of the inhabitants of that section were at least not hostile to the rebels. This remained the stronghold of the Maderists. They were able to force an agreement from the owners of the Mexico Northwestern Railroad not to haul troops in to attack them, in return for protection. Nevertheless, after another battle had taken place, placing General Navarro in sore straits, a train load of soldiers was sent in. They were attacked in a narrow defile and 31 were killed and 42 wounded. The battle lasted five hours. Three days later, however, two train loads of Federal troops, containing 1,300 men, were brought into Chihuahua and the government forces strengthened sufficiently to counterbalance the Maderists. At the same time the government centered its attention on breaking through the line of revolutionists with the purpose of attacking the revolution at its centre and putting an end to it.

At the beginning of 1911 it was plain to be seen that the insurrectionists were gaining in power and resources, the government suffering reverses in several small engagements. The rebellion broke out in so many widely scattered localities that the government was under the necessity of dividing its forces, thus vastly increasing its difficulties in coping with the enemy. In the north the cities of Chihuahua and Juarez were in revolt, and serious uprisings began to occur at Vera Cruz and Oaxaca in the south. The nucleus of a revolutionary government was being rapidly formed; indeed, Madero issued a manifesto, early in the year, that President Diaz's resignation must be forthcoming. The President, however, hoped to forestall such a necessity, and on 1 April suggested many reforms, principal of which were the untrammelled right of suffrage in future elections and a proviso in the constitution that the president should not succeed himself. Many changes were also made in the personnel of the cabinet; General Reyes, who had been banished, was invited to return and assume charge of the government forces, and negotiations were opened looking to peace with Madero, who had meanwhile been proclaimed provisional president.

During March 1911 a mobilization of American forces took place at San Antonio, Texas, from which point they were stationed at various places along the American border. Although other reasons were given at the time, this action was evidently taken to safeguard American neutrality and, if necessary, protect American interests. Some friction arose between the two governments, the mobilization being interpreted in many quarters as a harbinger of interference, but, on the whole, the two countries showed a mutually admirable forbearance in meeting a delicate situation, although lynchings of Mexicans occurred on the American side, and Americans were seized on Mexican soil (though afterwards released) and several were killed or wounded by stray bullets.

On 6 May peace negotiations were suspended; on 10 May Juarez was captured by the insurrectionists, and the revolt extended to the city of Mexico itself. On 25 May President Diaz resigned and, making a secret journey to Vera Cruz, sailed for Spain. Señor de la

MEXICO

Barra, who had been Ambassador to the United States but was recalled during the early spring and made Secretary of Foreign Affairs, was declared by General Madero President ad interim until new elections could be held. On 7 June Madero entered the capital in triumph, where he cooperated with de la Barra in endeavoring to prevent further bloodshed and preparing for the elections. Several encounters took place however, between the federal troops and Maderists.

The Mexican congress met on 15 September, and on 15 October General Francisco Madero was elected President of Mexico on a platform whose chief planks were constitutional government, no "Diazism," and no reflection of any state officials. General Bernardo Reyes was also a candidate but, estimating his case to be hopeless, he withdrew and came to the United States, leaving a clear field to Madero. In October, just before the election, there were some further conflicts between revolutionists and federal troops, the rebel leader Zapata being especially active; and, in November, General Reyes returned to gather many rebellious forces around him. The year closed with these two leaders being the chief antagonists of the new administration, but with Madero keeping a firm hand upon the situation.

The opening of 1912, however, witnessed a marked recrudescence of opposition. All the leaders of the old régime seemed to combine against the new order of things, and gathered about them many discontented spirits who had not realized their expectations of a sudden betterment of conditions. There was still an unsatisfied "Latin-American appetite for guerrilla warfare and an unfortunate tendency of defeated Mexican politicians to resort to bullets when ballots have not been cast according to their liking." These characteristics, together with other after-effects of the revolution which Madero himself began, still had to be reckoned with before some of the more flagrant "Diazisms" were to be finally uprooted.

In January, Emilio Gomez was named for provisional president by a faction of revolutionists. In February, Gonzales sent in his resignation as Minister of the Interior in Madero's cabinet and resumed the governorship of Chihuahua, a province which, from the first, had been foremost in insurrectionary movements. A few days later the army leaders Orozco and Vasquez revolted against Madero's rule and led in an endeavor to unite all hostile elements.

In March, Juarez fell to the rebels and the national bank there was looted by General Rojas; but at other points the federals won several important victories. A warning was sent to Madero by the United States that his government would be held responsible for any loss or injury to American life or property along the border; but, to allay alarm, Madero sent a message, in early April, to the Mexican congress, assuring the country that the United States had no intention to intervene. On 4 May, Emilio Gomez was proclaimed president, but General Orozco repudiated his cause the same day, and a week later, Gomez sought refuge in the United States. Orozco ordered an advance of his troops against the federals but was defeated, his men began to desert him, and, by

the first of June, he began to realize that the end of his resources was near. By the last of June he offered to surrender and asked amnesty, but the government refused to give assurances that his request would be granted.

In other parts of the republic various insurrectionists were still leading a more or less active warfare; but on the whole the situation has been greatly improved. The insurgents have bitterly complained that the promised rosy reforms were no nearer accomplishment, but the general disposition of the outside world as well as the better classes in Mexico is, in the summer of 1912, crystallizing in favor of giving the reform President a fair opportunity to carry out his program. This general feeling is succinctly summed up in the words of Señor Crespo y Martinez: "The conditions are not at all like those of a year ago. * * * The new government has started out well to bring about the desired changes, and I am assured that the more substantial classes favor giving President Madero and his advisers a fair trial."

It has not been possible to refer, even in a brief way, in an article of this character, to more than an infinitesimal part of the events which have gone to make up the history of Mexico. In order, therefore, to supply the deficiency as far as may be, the following chronological summary of the more important incidents which have unavoidably been passed over, is given by way of suggestion to the reader who may wish to look elsewhere for further and fuller information:

- 1530 — City of Puebla founded.
- 1535 — First printing press introduced and first book published in Mexico.
- 1540 — Search by Coronado for the "Seven Cities of Cibola."
- 1541 — City of Guadalajara founded.
- 1543 — City of Morelia (originally Valladolid) founded.
- 1563 — City of Durango founded.
- 1572 — Arrival of the Jesuits.
- 1585 — Paso del Norte (now Ciudad Juarez) settled.
- 1590 — Exploration of Pacific coast by Sebastian Vizcaino.
- 1608 — Santa Fe (New Mexico) founded.
- 1767 — Jesuits expelled.
- 1813 — Declaration of Independence.
- 1817 — Mexico invaded by the freebooter, Mina.
- 1821 — Treaty of Cordoba.
- 1822 — Congress organized and three political parties also organized — the Bourbonista, the Republican, and the Iturbidista.
- 1823 — Monroe doctrine proclaimed.
- 1824 — The United States of Mexico organized.
- 1828 — Radical, Conservative, and Moderate political parties organized.
- 1839 — Attempt by Spain to re-claim Mexico.
- 1834 — Program of government reforms proclaimed.
- 1835 — Central Republic established.
- 1836 — Revolt of Texas.
- 1840 — Empire proposed by Estrada.
- 1843 — Government centralized.
- 1845 — Texas annexed to the United States and war between Mexico and United States inaugurated.
- 1846 — California and New Mexico captured by the United States.
- 1847 — Advance of the army of the United States under General Scott, from Veracruz to Mexico City.
- 1849 — Government of Juarez established in Veracruz.
- 1861 — Payment of debts to foreign countries suspended for two years.
- 1862 — Defeat of French army at Puebla (May 5).
- 1863 — Capture of Puebla by French army.
- 1864 — Juarez's headquarters temporarily established at Chihuahua.
- 1865 — Paso del Norte made temporary headquarters by Juarez. The United States demanded withdrawal of French troops from Mexico.
- 1866 — Return of Juarez to Chihuahua.
- 1867 — Withdrawal of French troops from Mexico. Execution of Emperor Maximilian at Queretaro and return of Juarez to the City of Mexico.
- 1871 — Re-election of Juarez to the presidency.

MEXICO

- 1873—Death of Juárez and elevation of Lerdo de Tejada to the presidency as his successor.
 1873—Incorporation of the "reform" laws into the national constitution.
 1876—Plan of Tuxtepec adopted and General Porfirio Díaz made provisional president.
 1877—General Díaz elected constitutional president.
 1880—General Manuel González elected President to succeed General Díaz.
 1884—General Díaz elected President to succeed General González.
 1888, 1892, 1896, 1900, 1904—General Díaz elected President to succeed himself.
 1905—Monetary reform law enacted.
 1908—Much bitter anti-American sentiment manifested.
 1909—A meeting occurred between President Taft and Díaz on a neutral strip of territory near El Paso, Texas.
 1910—General Díaz was re-elected President, 26 July. During the entire month of September Mexico celebrated the anniversary of her independence. In October an insurrection broke out under the leadership of General Madero.
 1911—President Díaz was forced to resign. Señor de la Barra was made president *ad interim*. Gen. Francisco Madero was elected President in October.
 1912—Various insurrections against the new government, which were being firmly resisted.

ELISHA HOLLINGSWORTH TALBOT,
Author of 'Commercial and Industrial Mexico.'

4. **Mexico—Government.** The constitution of Mexico is based upon that of the United States, which it very much resembles. Like the United States the republic is formed into states free and sovereign in so far as their local affairs are concerned. But, for administrative matters which concern the interest of the states in general and as a whole, they are united under a federal government. In virtue of the constitution of 5 Feb. 1857, the national power resides in the people, who are theoretically the fountain of all public authority. In representation of the people the government of the country is carried on by the national government for the federation and by the state governments, each for its own state. But no state law must conflict with the general good as expressed by the laws of the federal government.

No slaves are allowed to be held in the country and all persons born in the republic are free and equal in the eyes of the law. The constitution asserts the right of every one to freedom of thought, profession and occupation. Education is free to all and the government is making strenuous efforts to educate the masses of the people. In so far as it is consistent with private rights and the exigencies of state, the press is free. In Mexico one may publish what he pleases, for there is absolutely no press censorship; but the libel laws are very strict and are intended to protect the citizen; and one may be imprisoned for libel or defamation of character.

The right to associate together for any lawful undertaking, business or enterprise is recognized fully by the law; and the complete individuality of every law-abiding citizen of the republic or resident therein is recognized, and he may enter or leave the country without a passport.

The right to petition the government is conceded to every citizen of the republic and he is protected in the same.

No person may be compelled to work for another, even though he may have formally agreed to do so, and may have been paid in advance for his services; and, if he do work, the law assures him payment for his work.

The country being essentially a republic, hereditary honors and all titles of nobility are not recognized, and no one connected with the government is permitted to accept or wear same unless by a special act of congress.

Arms may be carried for lawful personal defence. In certain districts a permit must be secured to carry arms; in others where there is need of them constantly, as in the wild mountain regions and mining camps, this permission is not obligatory.

Search without warrant is prohibited, and a policeman may not enter a private house without an order from the police court, unless it be in pursuit of a well-known criminal or one caught in the act of breaking the law.

As all are equal in the eyes of the law, privileged tribunals, such as were customary

MEXICO—GOVERNMENT

during the Spanish occupation of the country, are strictly prohibited. Thus every man, be he priest or layman, citizen or administrative officer of the government, is ruled by the one common law.

By the constitution of the republic the passing of all laws contrary to the interests of the country is also prohibited; and no treaties with other countries can be made for the extradition of political criminals.

By the law of the country and the conditions of the constitution, offences against law and order are divided into two great classes, namely, civil and criminal. No one may be imprisoned for any offence coming under the first head. This includes debts and all monetary obligations, provided there is nothing criminal about their contraction.

A person, once arrested, must be brought to trial within three days, and just cause shown for his detention or he must be set free; and whipping, torture, mutilation and other punishments of a like nature, which were common enough in previous periods of the history of Mexico, are declared contrary to law; and all punishments, except those of a correctional nature, must be administered by judges of the criminal courts.

The death penalty is practically never used in Mexico. It is stipulated in the constitution that it may be applied in cases of high treason, premeditated murder, parricide, and highway robberies. About the only cases in which it is now applied is that of offences of a most serious nature against the military authority.

In all legal action one may appeal from a lower to a higher court until the supreme court of the nation is reached and gives its decision, which is final. But in cases of the death penalty an appeal may be made to the clemency of the president of the republic. And once a man has been tried and acquitted he cannot be tried again.

In conformity with the principles of democratic government, no spying upon the private acts of the subjects of the republic is permitted and, therefore, all correspondence is declared inviolable.

In times of peace the quartering of soldiers upon private individuals is prohibited, and even in times of war it can only be done in conformity with certain regulations of congress, and with orders issued to fit the exigencies of the situation. This is only an extension of the law which recognizes the right to private property, which is guaranteed against the interference of a second person.

The constitution provides for the issuing of patent rights to inventions of use to mankind, for a certain length of time. It also recites the right of the government to a monopoly of the coinage of the money of the republic. By the constitution it is also given control of the postal system and such other public utilities as it may see fit to acquire in the interests of the prosperity of the country.

In case of serious internal disorder of whatever character which threatens the safety of the state or the government, the president has the right to suspend the constitutional guarantees; also in case of foreign invasion; but this must be with the consent of the cabinet and the congress or the congressional committee in case the congress be not in session.

Neither the church nor any kind of ecclesiastical bodies are allowed to acquire property. Therefore the church holds no property in its own name in Mexico.

The law with regard to Mexican citizenship is as follows: All children born of Mexican parents, whether in Mexico or in a foreign land, are, in the eyes of the Mexican law, Mexican citizens. Foreigners may become Mexican citizens by naturalization. All persons acquiring land in Mexico, by virtue of this acquisition, become Mexican citizens unless they distinctly state in their deed of acquisition that they reserve their right to the citizenship of their own country.

All Mexican citizens, whether native born or naturalized in any of the above indicated ways, are liable to military service.

All persons residing in the republic are guaranteed the protection of the laws of the country.

In Mexico marriage is a civil contract, and no other marriage ceremony except the civil one is legal. Therefore there are generally two marriage ceremonies performed, the civil one by a magistrate appointed by the government for that purpose, and one by the minister or priest of the church of which the contracting parties are adherents. This is a natural outcome of the separation of Church and State which took place in Mexico in 1873, as a result of an amendment to the constitution of 1857.

All religions which are not inimical to the interests of good government and the laws of the country are allowed to exist and to exercise their functions in Mexico. But, owing to the abuse of the Church in the establishment of monastic orders, and the undue influence exercised over parishioners to obtain wealth for these and other religious institutions, all monastic orders have been suppressed in Mexico.

As already stated, the government of the country is divided into federal and state, and the latter is subdivided into three branches, executive, legislative, and judicial. The chamber of deputies and the senate, constituting the congress of the union, are the legislative bodies, and by them alone can laws for the government of the country be enacted.

Two sessions of congress are held each year. The first, which begins on the first day of April, lasts from two to two and a half months; and its primary business is to audit all accounts of the previous year and to arrange the estimates for the incoming fiscal year.

The second session, which begins on the great national holiday, September 16, lasts from three to four months.

According to the laws of the country, there shall always be a president and a vice-president, and a cabinet composed of eight ministers, corresponding to the following departments of the government: Fomento, (encouragement) Foreign Affairs, Department of the Interior, Justice, Public Instruction and Fine Arts, Finance, Communications and Public Works, War and Marine. Each minister has charge of his own department of the government; and everything connected with his department theoretically passes through his hands, and all documents belonging to the department and issued by it are signed by him.

The judiciary consists of primary and su-

MEXICO—RELIGION

preme court; and cases adjudged by the primary court may be appealed and carried to the supreme court, from which an appeal may be made in cases of capital punishment to the president of the nation.

The revenues of the nation are derived from customs duties, stamp taxes, by contributions from the several states of the union and known as federal contribution, and from internal revenue taxes and other minor sources.

5. **Mexico—Religion.** The establishment of the Christian religion in Mexico dates back to the year 1517, when the Roman Catholic Church was founded in Yucatan, coincident with the discovery of that territory by a wealthy Cuban merchant named Cordova. One year later the bishopric of Yucatan was created but never occupied, because of unanticipated conditions attending and immediately following the Spanish conquest. In 1525, however, it was succeeded by the bishopric of Puebla, with dominion not only over Yucatan, but Puebla, Oaxaca, and Chiapas. In 1545 this was raised to an archbishopric, and in 1571 the archbishop was promoted to be Primate of New Spain. The first bishop to serve in Mexico arrived at Veracruz in 1528. Not until 1863, after 335 years of constant though varying growth was the Church divided into archdioceses, three of which were established in that year.

The history of the Inquisition in Mexico dates from 1571, in which year the first tribunal of that dreaded institution was founded, not to be suppressed until 1820, five years after its last victim,—the patriot Morelos, in whose honor one of the states was later named,—had by its orders been shot to death. The first "burning place," or scene of torture and execution by command of this tribunal, was on the spot now occupied by the beautiful park known as the Alameda.

Until 1859 it had been the fixed policy of the Church to acquire as much property, both real and personal, as possible; and it has been stated that in the year named its possessions included fully one-third of the wealth of the country. In the accomplishment of this purpose and generally in advancing the power of the Church and strengthening its hold upon people and government, the three most powerful influences were the Jesuit, Franciscan and Dominican orders. The Jesuits were expelled in 1856, and four years later all the other male religious orders were abolished by Juarez and those under his leadership. When, in 1874, the laws of reform became a part of the federal constitution, the establishments conducted by the Sisters of Charity, the only remaining religious order of females, were suppressed; since which time no member of an organization of this character has been permitted to pursue her vocation as such, within the boundaries of the republic.

In 1889 the Catholic Church of Mexico was represented by 1,349 vicarages and parishes, and 8,763 churches and chapels. In 1900 there were six archbishoprics, 23 bishoprics, and one vicarage apostolic. In the same year there were in the republic, according to the Department of Fomento, 13,533,013 Catholics, 51,795 Protestants, 90 Mohammedans, 1,421 Mormons, 2,090 Buddhists, 145 Israelites, 64 Greeks, and 18,640 without religious affiliations.

The first Protestant missionary to enter the Mexican field was a woman,—Miss Matilda Rankin,—who began work there some 40 years ago. In 1869 the "Church of Jesus in Mexico," was established, its promoters declaring in their declaration of principles that they "desired a greater liberty of conscience, a purer worship, and a better church organization." In the same year the Rev. Henry C. Riley, a Protestant Episcopal clergyman, went to Mexico, his efforts and those of his coworkers resulting in the organization of the "Church of San Francisco." The congregation worshipped in a building located on the spot which had been occupied by the gardens and wild beast house of the Kings of Tenochtitlan. The Presbyterian Mission entered the field in 1873, the Methodist Episcopal Church following closely, in the person of the Rev. William Butler, whose son, the Rev. Dr. John W. Butler, followed a few months later and is still in active work there; he in turn being followed by other Protestant organizations until, by 1889, there were in the republic 88 Protestant churches and chapels, 21 of which were in the capital, 13 in the state of Michoacan, 13 in Puebla, 10 in Morelos, 5 in Mexico, 3 each in Hidalgo, Tamaulipas, and Veracruz, 2 each in Queretaro, Jalisco, Tabasco, and Zacatecas, and 1 each in Tlaxcala, Aguascalientes, Nuevo Leon and Tepic. Miss Rankin, referred to above, confined her work to Monterey and vicinity, where she remained some 20 years.

The number of Protestant congregations now in Mexico is over 900, with an actual membership of at least 20,000, and not less than 100,000 "adherents," or attendants, all of whom are Protestants in belief, although not yet enrolled as members of any particular denomination. Of the 20,000 actual membership, 6,000 are Methodists and 6,000 Presbyterians, other denominations lining up as to membership in the following order: Methodist Episcopal Church South, Baptists, Congregationalists, and Episcopalians. Other denominations are represented, but only by a limited membership. Over 15,000 children now attend the numerous schools conducted by the Protestant churches. The Methodist Episcopal denomination supports a hospital at Guanajuato and dispensaries at Silao and Leon; the Methodist Church South is doing medical work at Monterey and San Luis Potosi, the Baptist Church at Leon, and the Adventist Church at Guadalajara.

Everywhere in the republic there is unrestricted freedom of worship, and the same respect is shown and protection extended to Protestants as to Catholics, notwithstanding that the religion of the latter has always been the ruling one of the country and now has a hundred and thirty times as many followers as have all the others combined. Some idea of the value of Church property being acquired by the Protestant denominations may be formed from the fact that the Methodist Episcopal Church alone possesses not less than \$500,000 worth (gold valuation).

The Catholic Church of Mexico has not been permitted to own the buildings in which it worships, nor has its clergy been allowed to appear in public, exposing to view any insignia of its calling, or conducting any procession or

MEXICO — EDUCATION

religious ceremony, since 1839, in which year Church and State were divorced forever, in this country. There does not exist a convent, either for nuns or friars, in all the land, and the Catholic houses of worship are only occupied at the sufferance of the government, by which they are owned.

It was stated at an evangelical assembly held in the City of Mexico in February 1888 and composed of "the various Protestant denominations and evangelical societies conducting missionary operations in Mexico," that there were at that time 600 Protestant congregations, 192 foreign and 585 native "workers," 7,000 attendants at the Protestant day schools, 10,000 at Sunday schools, 18,000 communicants, and a Protestant community of 60,000 souls in the republic.

The famous Catholic Cathedral in the City of Mexico cost, for its walls alone, over \$2,000,000 and was 96 years under construction. It is 426 feet in length and 203 feet in width, has two great naves, 20 small side chapels, one of the grandest altars in the world, supported by immense columns of white marble, and is surmounted by five imposing domes and two open towers 218 feet high. A magnificent balustrade with 62 statues of rich gold, silver, and copper alloy, and an elaborately carved choir enclosed by railings of tumbago weighing 26 tons and valued at \$1,500,000, are the most notable features of the interior of this historic edifice. In the almost equally famous church of Guadalupe, a few miles distant from the capital, several tons of pure silver were employed for various useful or decorative purposes. The great cathedral in the city of Puebla is regarded as more beautiful in its interior finish, decorations and general design than any other church edifice on the American continent.

JOHN W. BUTLER.

Author of 'Sketches of Mexico in Prehistoric, Primitive, Colonial and Modern Times.'

6. Mexico — Education. To the credit of the enlightened and progressive men who have for the past quarter of a century had actual control of the destinies of Mexico, the subject of education has received its full share of attention; and the results accomplished give eloquent testimony to the wisdom and earnestness of their efforts. When General Porfirio Diaz was first elected President, in 1872, there were only about 4,000 public schools in the entire republic. From the coming of the Spaniards the chief interest in education had been confined to the higher branches,—to the establishment of seminaries, colleges, and universities,—and the primary or fundamental branches were neglected. Under the policy inspired by President Diaz there has resulted a phenomenal increase of schools and attendance. In the period between 1872 and 1891 schools of all classes had increased from 4,250 to more than 10,000 and the total attendance from 160,000 to 649,771; and from 1866 to 1891 the attendance of mestizos (half-breeds), from 16,000 to 235,000, and of Indians from about 8,000 to 170,000. In 1891 the total attendance was 722,415, and the entire cost of maintenance was \$4,068,300, which sum was paid by the federal and state governments. The average cost per capita was \$5.63. In 1903, the number of primary schools supported by the federal or state governments was 6,350, and

by municipalities, 2,955; total, 9,305; and the attendance was 484,570—males, 299,289; females, 185,281. The total number examined as to proficiency was 413,157, of which 333,501 were "approved" and 26,418 completed their studies. There were 49 secondary and preparatory schools supported by the federal and state governments, with an attendance of 5,561, of which 4,056 were males and 1,495 females, the number examined being 4,878, and "approved" 4,046. Of the latter, 388 completed their studies. In the same year there were 37 "professional" schools, with an attendance of 2,834, of which 1,667 were males and 1,167 females; number examined 2,443, "approved" 2,298, graduated 221, total number of teachers and other employees of public schools, 18,024; expenses, \$8,454,329. Number of private schools same year, 1,790; number supported by the clergy, 437; and by associations, 150. Of these 2,339 were primary, 29 secondary, and 9 professional; attendance 60,087 males, 52,916 females—total 113,003; number examined, 79,351; "approved," 67,695; and 4,939 completed their studies. The grand total of schools of all kinds was 11,794 and attendance 605,968, of which 365,099 were males and 240,859 females.

The number of public libraries in 1903 was 135, containing 743,559 volumes; number of museums 37, of which nine were archaeological, seven scientific, seven natural history, one geological and metallurgical, three agricultural, one medical and anatomical, one industrial, two commercial, and six miscellaneous. There were 56 scientific and literary societies and 429 publications, of which latter 10 were dailies, 10 tri-weeklies, 30 semi-weeklies, 225 weeklies, 4 tri-monthlies, 57 semi-monthlies, 6 monthlies, and 11 irregular. Of the total number, 43 were official organs, 56 political, 36 religious, 41 scientific, 61 literary, 4 scientific and literary, 5 musical; 74 were devoted to general information, 12 to commercial topics, 14 to education, 16 to industries, 12 to art, and 65 to miscellaneous subjects and interests.

In 1900 there were 1,273,325 males and 906,263 females who could read and write; 163,568 males and 184,335 females who could read but not write; and 3,119,914 males and 3,664,680 females above the age of 12 years who could neither read nor write.

A law was enacted in 1888 but not put into force until 1896, making elementary education compulsory and compelling the establishment and maintenance of at least one public school for every 4,000 inhabitants. Under the provisions of this law the advance in education and educational methods throughout the republic has probably been without a parallel.

The early history of education in Mexico is particularly interesting. In 1529, or 377 years ago, the College of San Juan de Letran was established in the capital and threw its doors open to Spaniards and Indians alike. The first university was opened in 1553 by special permission of the King of Spain. In 1573 two colleges,—those of San Gregorio and San Ildefonso,—were opened, two others and a divinity school being established a few years later. Thus it will be seen that seven institutions of higher education were in operation in Mexico before the close of the 16th century. It was not until 1578 that the science of medicine was recognized as meriting a place among the branches

MEXICO.

JUSTO SIERRA.

.

MEXICO—EDUCATION

of higher education, the first chair of medicine being established in that year. Twenty-one years later another medical professorship was founded, and in 1681 anatomy and surgery were added. In 1768 the Royal College of Surgeons was established in the City of Mexico and still enjoys a most useful and prosperous existence as the National School of Medicine, the new name having been adopted in 1845. Its home is in the great building made famous as the scene of the indescribable horrors of the Spanish Inquisition. The Mining College or School of Engineering, established in 1793, occupies an edifice built by the Spaniards at a cost of \$3,000,000, and is in a most flourishing condition. Although these heartless conquerors of one of the noblest and most ancient races of the world seem to have been inspired by avarice, cupidity, and brutality in their treatment of the simple people conquered by them, it cannot be denied that they were sincerely devoted to the cause of higher education, contributing most liberally from public revenues and private fortunes to its advancement. In the City of Mexico was founded in 1551, by the Spanish crown, the first university in America,—almost 200 years before the independence of the United States was accomplished. The building, which is still in a good state of preservation, is now occupied by the National Conservatory of Music. The National Academy of Art occupies the building which was the home of the first school of the new world,—a school for Indians; the normal school for males and its companion school for females occupy historic buildings completed respectively in 1678 and 1648, the Jesuit College of San Ildefonso, erected in 1749 at a cost of \$400,000, is now the home of the National Preparatory School; the Manual Training School for boys occupies a building erected in 1598; the National Library, with its more than 200,000 priceless volumes, was formerly the Church of San Augustin; the building in which is now located the National Museum dates back to 1731 and cost \$1,000,000, and a college for young women now occupies a grand structure completed in 1734 at a cost of \$2,000,000. Thus are education and history closely intertwined. In 1824 Humboldt wrote: "No city of the new continent, not excepting those of the United States, presents scientific establishments so great and so solid as those of the capital of Mexico."

It is safe to say that no important country in the world devotes as much official attention to education, both primary and advanced, or directly contributes so largely from its revenues, to the advancement of learning among the masses, in proportion to its means, as does Mexico. And this assertion applies alike to the federal, state, and municipal governments, by all of which this great cause is placed above every other. Nor have the devoted men and women in charge of this work had to deal with intellectual density, by any means; but rather with a condition of ignorance for which these people have themselves been blameless; for not only the half-breeds but the Indians are capable of great mental development. They are naturally intelligent, receptive, quick to understand, and are possessed of phenomenally retentive memories. They had only needed opportunity and encouragement.

In most of the states, schools for the care

and instruction of orphans are maintained at the public expense, in which both sexes are given the advantages of a primary education, and where boys are taught the ordinary trades, and girls are instructed in the various occupations pertaining to the sex. In these noble charities, as well as throughout the entire educational machinery of the republic, modern methods have been adopted, and system, progress, and thoroughness prevail. Everywhere there is manifested the deepest interest in the uplifting of the masses through the most effective of all agencies—education. As a rule, the immediate surroundings of schools of all classes are being rendered constantly more attractive and refining in character, and sanitary and hygienic advancement has been most marked. The percentage of illiteracy and criminology is being notably reduced; the standard of morals is rapidly advancing, and the conditions which affect the public health are being constantly improved. In framing its school laws, Mexico has paid a very high compliment to the United States, by almost literally adopting its thoroughly tested system and employing its proven methods. With the passing of another decade the wisdom of this course will receive still further and more pronounced illustration.

Conspicuous among the means of education in Mexico are the public libraries, museums, art schools and collections, literary and scientific societies, and periodicals. The National Library, which has a delightful and very convenient building and location in the capital, is indeed a noble institution. In its collection of more than 200,000 volumes are many rare books and manuscripts, the value of which is not to be stated in dollars and cents. Among these are works by early Spanish historians and scholars, which, having been written before the art of printing was known, cannot possibly be duplicated. In most cases these not only possess great literary merit but strikingly illustrate the possibilities of penmanship as an art and of illuminated title pages and initial letters. A very large proportion of the volumes in this library were originally the property of the church or of the priesthood, and were confiscated by the government during the progress of the war of reform, to prevent their destruction or removal, as well as to place them where access to them could always be had by the public. Naturally, most of them deal only with religion or history in some of the many phases of these broad subjects or departments of learning. Of similar character are most of the libraries which have been assembled and are supported by the several states.

While there are some 40 public museums distributed throughout the republic, many of which are quite extensive and all of which are exceedingly interesting and instructive, far greater importance attaches to the one located in the City of Mexico and supported by the federal government, than to all the others combined. Although this has only occupied its present quarters in the National Palace since 1865, and was not actually established until 1831, in which year the collections previously belonging to the Conservatory of Antiquities founded by Emperor Iturbide in 1822, and to the Royal University, to which Viceroy Bucareli y Ursua had in 1775 transferred the remnants of a most valuable collection of maps, hiero-

MEXICO — LITERATURE

glyphs on skins, manuscripts, etc., were in 1831 consolidated under the name of the National Museum, its origin really dates back almost 133 years. Here the student of archaeology, of ethnology, or of any other department of the ancient history of the American continent, or of the peoples who have at different periods dwelt upon it, may find greater wealth of materials for investigation and study than exists in any similar institution in the western world.

While there are also a number of very important art collections in the principal state capitals, the National Gallery, located in the City of Mexico, holds unquestioned pre-eminence. In this, as in every other department of intellectual or material development, individual effort is in a most practical manner promoted and encouraged by the government; and as a result there is constant and marked advance in the growth of art in all its features. Chief among the influences that have accomplished and are accomplishing so much in this direction is the National School of Art. The federal government will shortly erect in the City of Mexico, a palace of art, in the further encouragement of native talent and ambition, which will rival any similar institution on this continent.

Of literary and scientific societies there are many. Every considerable community is the home of one or more of these associations, some of which have been in existence many years, and all of which have well served a noble purpose. The average educated Mexican is a fluent, even an eloquent speaker, as well as a versatile and graceful writer. In the work of education a very important part is performed by the periodicals of the country, a large percentage of which is especially devoted to pedagogy, art, or the sciences. Among them are representatives of almost every phase of advanced, religious, political, or other thought.

ELISHA HOLLINGSWORTH TALBOT,
Author of 'Commercial and Industrial Mexico.'

7. Mexico—Literature. Of Mexican literature written previous to the Spanish conquest of the country little exists, and that little in the form of translations into Spanish. However, this is of a sufficiently lofty and poetical character to lead us to believe that the Mexican people, and especially the Texcocoans, really had a literature worthy of preservation.

Around the romantic career of Netzahualcoyotl, king of Texcoco, who reigned shortly before the Spanish conquest, there clusters many a legend and story. By early Spanish writers on Mexican subjects and by native Mexican writers immediately following the Spanish conquest, he is asserted to have been a great and inspired poet. But poetry was a gift of the Mexican races; and the stories and legends which still exist in the mouths of the poor and ignorant Indians are often strikingly imaginative, poetical, and beautiful. Notwithstanding the discredit that has been cast upon the stories of literary culture in Texcoco in the time of Netzahualcoyotl, there is little doubt that the people of Texcoco represented the highest culture of the poetical races of old Mexico: and, as such, it would not have been strange if, as was asserted by early Spanish writers, the court of Texcoco

was given up to literature, science, and culture, of which the king was himself the leading spirit.

This belief finds curious confirmation in the fact that, immediately following the conquest of Mexico, the native races produced many literary men of talent, who have left us much of the information which we now possess of Mexico previous to the coming of the Spaniards.

Owing to the unsettled condition of the country, the oppression of the native Mexican races, the wild quest of the Spaniards for gold, and the general contempt for learning which gradually took hold of New Spain, this early enthusiasm for letters disappeared; and the only records we have of these times, are to be found in the chronicles of the religious orders of the 17th century. Though these are of great historical value, they are not always entertaining reading. Among these chroniclers the most important are Agustin Betancourt, Beltazar de Medina, Motolina, Antonio de la Rea and Gerónimo Mendieta.

However, in the darkness of this period, there are three names which have won international reputation. These are Carlos de Sigüenza, Sor Juana Inez de la Cruz and the dramatist Alarcon, the latter of whom was received with open arms in Spain, where his dramas were very popular.

Toward the close of the 17th century Mexican literature began to revive again and, we have three names which are known wherever the Spanish language is read. These are Clavigero, Gama, and Veytia, all historians of note. To these must be added the names of Manuel Navarrete, who wrote fervid religious poetry; De Lizardi, the greatest thinker of the pre-revolutionary times, and Tagle, the herald of the revolution, a poet of force and inspiration, but of little culture.

In the first part of the 19th century, the names of Gorostiza, Carpio, and Pesado stand forth above all others for their brilliancy of thought and expression and the earnestness which inspired them. This earnestness was a part of the spirit of the times induced by the strenuous life which the threatening revolution and the unsettled condition of the country inspired.

From this time on Mexican literature is not without names of note, the principal of whom are, from the early part of the 19th century, Alpuche, the renowned dramatist, Calderon, Jesus Diaz, Galvan, the romantic and lyrical poet and dramatist, Martinez, and Segura. But of all the names of this period the greatest is easily that of the poet Guillermo Prieto, the great high priest of the reform movement, and narrator of the glories of the nation and the customs of the people.

Contemporaneous with Prieto were Ignacio Ramirez, "El Necromancer," who fought valiantly for the independence of his country, and Collado, a poet who helped to create a desire for a national literature.

Escandon, a classical poet; Diaz Mirón, a noted writer and singer; Aldana the dramatist; Isabel Prieto de Landáuri, also a prolific dramatist; Ortiz, the Classical poet; Covarrubias, the young soldier who died while on the threshold of fame; Moreno, a sweet and simple poet of nature; Flores, the blind epic bard, and

MEXICO—LITERATURE

Altamirano, the "inspired Indian" are a long list of names that would do honor to any country. They seem to have been inspired with the restless longing of the times, the unsettled condition of the country and the ever-changing panorama of life and action around them. But, though every man of those mentioned above was more or less in sympathy with the condition of his country, two names stand out above all others in their ability to feel every pulse of the times and the people. These are Vicente Riva Palacio and Ignacio M. Altamirano. Both men were fighters, both in a literal and literary sense, and they pictured vividly and realistically the stormy times through which they passed.

Manuel Acuña stands by himself as the most lyrical, rhythmic, and poetical of the poets of the latter part of the 19th century. Gutierrez Nájara—"El Duque Job," Justo Sierra, Juan de Dios Peza, Antonio Zaragoza, Manuel Othón, Peon Contreras, Juan A. Mateos, Roa Bárcena, are names that have raised Mexican literature to a higher pinnacle. They represent a movement in every branch of literature, lyric poetry, pastoral and heroic poetry, history, criticism, philosophy, science, comedy, and the drama. These men created a new literature for their country and their names are all known wherever Spanish is the language of the people.

But, in addition to these, there are many minor names which, in a less fruitful literary period, would have been names of prominence. As it is they have all done work worthy of mention. Santiago Sierra, brother of Justo Sierra, and a young poet of great promise, died at the age of 30; Cuenca, one of the relatively greatest poets of Mexico, died at the age of 34; Domínguez, the poet of sweet melancholy; Esteva, the painter of national customs; Roa Bárcena, the poet and historian of the Imperialist party; Blengio, a successful sonnet writer; Pagaza, noted for the classical finish of his verses; Rincon, the Hood of Mexico; Justo Sierra, novelist, historian, chronologist, critic, educator, and lyrical poet; Sosa, biographer, journalist, bibliographer, and historian; Zayas Enriquez, lyric poet and dramatist; Cosmes, journalist and poet; Rojas, lawyer, statesman, journalist, and poet; Caballero, lyric and pastoral poet and journalist; Camara, romantic poet; Laura Mendez de Cuenca, a prolific writer of varied talents and imagination; Delgado, novelist and poet; Salvador Díaz Mirón, orator of note and one of the best lyrical poets of to-day; Parra, a noted writer on all kinds of scientific subjects, and a gifted poet; Gonzalez, Llorente, and Canton, poets and prose writers; Luchichí and Acal poets and critics; Carvajal, lawyer, journalist, and poet.

But when all these are mentioned there is still a list of respectable length of the younger poets and writers who have already made a place for themselves. The most noteworthy of these are: Francisco A. de Icaza, Ignacio Ancona Horrutyner, Balbino Dávalos, Enrique Fernandez Granados, Jose M. Bustillos, José Peon del Valle, Jose I. Novelo, Luis G. Urbina, Manuel Larráñaga y Portugal, José Juan Tablado.

In this long list there is one name omitted, which, in importance rises above all the others. This is that of Juan de Dios Peza, who, next to Guillermo Prieto, is the most popular poet

Mexico has produced. He is, in addition to this, a noted journalist and orator.

Orozco y Berra, who died in 1881, was one of the most painstaking and intelligent historians, and his works on the primitive history of Mexico and the Spanish conquest are standard authorities.

Riva Palacio is the most original and keenest literary critic Mexico has produced, and his historical novels are the best of their kind. He is always accurate, correct and logical, and his wealth of illustrations, his storytelling faculty, his imagination, his humor and his dramatic power, make him one of the most original literary men in Mexican history.

To Joaquín García Icazbalceta Mexico owes much for the careful and intelligent manner in which he has collected together documents for the history of Mexico. He is a poet of note and one of the most forcible writers in Mexico.

Alfredo Chavero, as historian, archaeologist, editor, and statesman, has long been a prominent figure in Mexican literary and political life.

José María Vigil, as poet, historian, educator, journalist, and dramatist, has done much to advance the standard of literature in Mexico.

Roman Manterola deserves a word of mention. He is the most famous philosopher the American continent has produced, for he has thrown aside the philosophies of other countries and has worked out his own system. To him the bases of all true philosophy are the necessities of human life, whether they be actual necessities, or those pleasures and adjuncts which go to make life more perfect. He is in the strictest sense a utilitarian, but, withal, a very pleasant one.

The literary work done by Mexico in the line of comedy and drama is remarkable. Many of these dramas are the equal of those written in Spain by the most noted of modern dramatists; and this work is not confined to one writer, for there are at least half a dozen who would attract attention anywhere. Mexican writers are naturally good dramatists, for they have the sense of action and the imagination which, with the proper selection of characters and scenes, form the elements of the drama.

As in the past, the caste feeling has been so strong, it has been almost impossible for the people of the middle and upper classes to enter into the lives of the lower classes; for this reason this class of the people have entered, to little or no extent, into the literature of the Mexican literati. Thus, many of the writers, especially of the novel, have found their inspiration out of their own country; and those who have found their subjects and characters at home, have treated of middle and upper class life. So, therefore, the literature of the country has not, as yet fully developed all the sides of national character. So the coming literary men of Mexico have still a wide and interesting field in which to pursue their literary labors.

For this reason, though there have been a good many novels written by Mexican writers, this department of the Mexican national literature, contrary to that of Spain of the same period, is the least interesting. Poetry, the drama, history, literary criticism, and works on sciences and political subjects form the great bases of the literary productions of Mexican authors. And this has its origin in the condi-

MEXICO — LITERATURE

tions already mentioned, which have caused a want of unity in the national life, and, until this is bridged over, we will probably never have the great and distinctively Mexican novel. Of all the writers of Mexico, Juan A. Mateos comes the nearest to producing a distinctively Mexican novel. But, though many of his stories are purely Mexican, yet he deals, for the most part, with the heroic characters of his times, and so does not give us a complete picture of Mexico.

No sketch of Mexican literature would be complete without some reference to the historical writers who form such an important part of the literary movements of the different literary periods of the country.

Following the Spanish conquest of the country most of the literature of Mexico was written by Spanish monks and priests, and, under their direction, by native Indian princes and noblemen, who had been educated in church schools established by the Spaniards.

Of the early Spanish writers who devoted themselves to Mexican history the most noteworthy was Bernal Diaz de Castillo, the rough old captain who fought with Cortez throughout all his campaigns from the time he first set foot in Mexico to the day when all Mexico was declared subject to the Spanish crown. The priest, Bernardo de Sahagún, has left us the most complete account of the customs, habits, political institutions, religious beliefs, ceremonies, and ritual, which we have of the Mexican people at the time of the conquest. Ixtlixochitl, in his historical works and his accounts of the Chichimecas, has given us the standpoint of a native Indian prince, educated under the Spaniards. While his histories are interesting they have evidently been influenced by his desire to show the importance of his own little kingdom in the Aztec confederacy. Juan de Torquemada has left us 21 books of very interesting information about the people of Mexico in his day, and he has also given us an account of the Indian monarchy at the time of the conquest and the following years.

Of the other writers on historical subjects the following are noteworthy, and all have written works of interest to students of Mexican history: De Zurita, 'A Short Summary of the Relations of the Chiefs of New Spain'; Molina, 'The Conquest of Yucatan'; Leon, 'Annals of the Museum of Michoacan'; 'The Last Days of Ocampo'; 'The Printing Press in Mexico'; Icazbalceta, 'A Collection of Documents for the History of Mexico'; Chavero, 'Ancient History of Mexico'; Clavijero, 'Ancient History of Mexico'; Muñoz, 'History of Tlaxcala'; Tezomoc, 'Mexican Chronicle'; Orozco y Berra, 'The Tonamtl'; 'Money in Mexico'; 'Notes for the History of Money and Coinage in Mexico from before the Conquest'; Solis, 'History of Mexico'; Bustamante, 'The Mexican Revolution'; 'The Voice of the Country'; 'Data for the History of the Government of Santa Anna'; 'The New Bernal Diaz'; Antuñano, 'Documents for the History of Industry in Mexico'; Diaz Covarrubias, 'Public Instruction in Mexico'; Arrangoiz, 'Documents for the History of the Second Mexican Empire'; Guerra, 'History of the Revolution in New Spain'; Hernandez, 'Collection of Documents for the History of the Independence of Mexico'; Mora, 'Mexico and her Revolutions'; M.

Riva Palacio, 'Notes on the Trial of Maximilian'; Vicente Riva Palacio, 'History of the Administration of Sebastián Lerdo de Tejada'; Hidalgo, 'Notes for a History of Monarchical Projects in Mexico'; 'History of the Revolution in Mexico against the Dictatorship of Santa Anna'; Ruiz, 'History of the War of Intervention in Michoacan.'

The following is a fairly complete bibliography of Mexican authors:

ACUÑA, MANUEL (1849-1873), is the Chatterton of Mexico, the marvelous soul that perished in his pride. A great critic has said that the name of Acuña alone would be sufficient to give Mexico the right to say that she had a literature and "a glorious one at that." Acuña was a deep thinker, a poet of most vivid imagination with a heart sensible to all the beauties of nature and all the sentiments and feelings of the human heart. In a fit of despondency over an unsuccessful love affair he committed suicide. In Mexico Acuña is pointed to with pride as the perfection of poetic fervor and beauty of imagination and sentiment. His works are purely poetical and principally lyrical.

ALONSO, RAMON (1833-1852), was a lawyer, journalist, politician, poet and dramatist. His dramas have been repeatedly produced in Mexico with success. Of these the most noted are 'Felicity and Honor', 'Nobility of Heart', 'A Pledge of Vengeance', and 'Head and Heart.'

ALTAMIRANO, IGNACIO M. (1830-1893), one of the greatest thinkers and most fervid writers that Mexico has produced was a pure Aztec Indian. Like Juarez, the great Indian president, he was 14 years old before he received any kind of education, with the exception of the very rudimentary notions of learning which were then taught in the primary schools in the Indian villages of the interior. Step by step he climbed until he was recognized as one of the greatest scholars of his day in his own country. Altamirano was a polished prose writer, and an inspired poet, a critic, biographer, journalist and novelist. In his day, he did more to influence Mexico for the revolution than any other man. The book by which Altamirano will probably be longest remembered is 'Landscapes and Legends' (1884). He was consul general of Mexico in Spain and later in Paris.

BARCEÑA, JOSE MARIA ROA (1827-). Of all the Imperialistic writers of Mexico there is one name which stands out above the others, that of the late Jose Maria Roa Barcena. On five different occasions during his life, Barcena published volumes of poems, all of which became popular. Many of these poems have been republished in Madrid, and translations have been made into Italian and French. In addition to much poetry Barcena wrote novels, history, and a book of 'Legends of Mexico.' The book which will probably have most interest for Americans is 'Recollections of the American Invasion, 1846 to 1847.' Barcena's shorter stories are the best that Mexico has produced. They have all the mysticism of Poe, with considerably more humor.

BLAKE, WILSON WILKINSON (1850-), (M.A. Monmouth College), Author of 'The Cross, Ancient and Modern,' (New York 1880), 'The Aztec Calendar,' 'The Antiquities of Mexico,' (New York 1891); 'Tourists' Guide to Mexico,' (1893), 'Catalogue of the Collections of the National Museum of Mexico,' (1886), and seven catalogues of Mexican books.

BUSTILLOS, JOSE M. (1866-). Bustillos has set for himself the task of making popular a national poetry. He has sung the glories of the "Mexican race." Mexican is here used in the sense of the ancient Aztec and other peoples who were found here on the coming of the Spaniards. Although he has fallen somewhat short of his aim, his poetry has in it an earnestness of purpose which merits for it the attention of every student of the literature of Mexico. It is in 'The Rocks of the Lake' that he has best carried out his ambitious plans.

BYLES, REV. JOHN W., D.D. (1851-), author of 'Sketches of Mexico in Prehistoric, Primitive, Colonial and Modern Times' (New York 1894). Has resided in Mexico over 30 years, during all of which time he has been pastor of the leading Methodist church of the republic.

CALDERON, FERNANDO (1809-1845), in his short life, became for Mexico what his famous namesake is for Spain. To him is the glory of having created a national drama for Mexico. Of all the old plays of the country his are still the most popular, and they contain more material of a dramatic nature than those of any other native writer, though they are not all upon native subjects, as are the plays of some of the modern native writers. He was wonderfully prolific and his works

MEXICO — LITERATURE

include a long list among which the following are all well known: 'Bernardo and Anita,' 'Zadig-Zella, or the Indian Slave-woman,' 'Armador,' 'Fritillas of the Day,' 'Mamero, Count of Lucena,' 'Ingenia,' 'Heracles and Virginia,' 'None of the Three,' 'The Tourist,' 'Anne Holroyd,' 'Herman, or the Master of the Crusader.' Calderon is the pride of the Mexican stage, and is considered the great light of Mexican literature. This is all true, but there are other writers who have done as much or more for the Mexican drama. For, while Calderon has been a very prolific and clever writer, yet he has gone abroad for as many of his subjects as he might have as well been Spanish, French, English, German or any other nationality so far as the comprehension of his drama is concerned. In contradistinction to this many of the writers of the latter half of the 19th century bent all their efforts to create a really national drama, and, with this end in view, picked their subjects and characters from Mexico and Mexican life.

Carpio, Manuel (1791-1866), is noted as a poet of wide range of sympathies and lyrical fervor. In the domain of descriptive poetry he has no superior in Mexico but he has successfully entered all the domains of profane and religious poetry, and he was the first in Mexico to successfully handle the true epic. One critic of note has said of Carpio: 'His compositions are a true gallery of exact and well-painted pictures, painted by the hand of sympathetic imagination, and that depth of feeling which makes man draw to him, and on return to them again and again and ever find pleasure in them.'

Casas, Joaquin (1848-), is the best known writer in Mexico on political economy and civil and kindred subjects. Among his published works are: 'The Banking Question,' 'History of the London Debt,' 'The Monetary Question,' 'International Exchange,' and 'A History of the Gold and Silver Question.' Mr. Casas has held many important commissions from the Mexican government, and at present is Mexican ambassador at Washington. To him is due, in a great measure, the extension of the banking system in Mexico. But he is more than a writer on political science for he has done some good literary work, and as a translator has few superiors in the Spanish language. His translations of Horace's 'Odes' and 'Sappho' into Spanish are faithful, rhythmical and poetical.

Chavez, Alvaro (1841-) As a historian and authority upon the antiquities of Mexico, Alfredo Chavez early stands first. He began his career as a lawyer and made politics a study to such good effect that the year he attained his majority he was elected a member of congress. Since that day he has been constantly in politics. Chavez is also a dramatist of fine talent, and his plays have been repeatedly produced upon the Spanish stage, and for a time he was a very popular dramatist in Madrid. He was one of the prime movers in the publication of the monumental work 'Mexico throughout the Centuries,' of the first volume of which he himself is the author. Among his well known plays are 'The Love of Alarcón,' 'Quetzalcoatl,' and 'Xochitl.' Among Chavez's archeological works of note are 'Mexican Antiquities,' profusely illustrated, 'The Astronomical Gods of the Ancient Mexicans,' 'Historical Paintings,' 'The Wheel of Years,' 'A History of Mexico,' in five volumes. In addition to these he has published several critical and literary biographies, among which the most important are those of Bernal, Sahagún, Sigüenza, Ixtapal and Montezuma.

Contreras, José Pío y (1842-) José Pío y Contreras has led a most active life. As a medical doctor he has occupied important posts under the Mexican government, which required heavy work; yet he has done more and better literary work than many other men who have devoted all their efforts to literature, and who have brought talents to their work. As a dramatist Contreras stands easily in the very first rank in Mexico and as a lyric poet he has no superior in his own country. 'Unto Heaven' (1874), a drama which at once made him famous, was rapidly followed by many others, several of which were successfully produced in Madrid, where the author was a favorite. Contreras has also published many poems and two novels, all of which are popular with the Mexican people, and most of which have already obtained a continental reputation.

Cruz, Guadalupe Leon de la (1851-1864) Señora Juana de la Cruz is the most inspired woman writer that Mexico has produced, and her name has become a household word throughout the country. Sorbettes, streets, and clubs have been named after her. Literary meetings without number have been held in her honor and Mexico has placed her upon the highest pinnacle of literary honor. At the age of 17 she became a nun, and, even before that she had attained fame in the literary world of Mexico. Few writers

have equaled her in their knowledge of the human heart and all its moods and passions. She has been lovingly called, by the Mexican people, the tenth muse. In addition to being the most renowned poet of her day, she was looked upon as a marvel of learning, her knowledge extending into almost all branches of human knowledge.

Cuadras, Antonio Garcia (1820-), is a member of the geological societies of London, Madrid, Paris and Rome, and of practically all the scientific societies of Mexico. In addition to that, he has been active in the promotion of education in the republic. He holds the cross of the Legion of Honor. Garcia Cuadras has had numerous important government appointments. In 1853 he published the first good general map of the Republic of Mexico. In 1857 he issued his first atlas, since which time he has been continuously publishing improved maps, plans and atlases of the Republic of Mexico. He has also done considerable literary work.

Cuadras, Juan Y. de (1822-), who began his literary career in 1848, has written a number of very successful comedies and has filled the editor of several important publications in the capital of the republic. His best known comedies are 'The Art of Love,' 'Old Man Chastou,' and 'Poor Boys.' Of his serious dramas 'Grisio and Sacrifices,' and 'Moral y Figura' are among his best. The latter was one of the most pronounced successes that have ever appeared upon the Mexican stage. Cuadras has also written a number of successful novels, 'Salad and Chickens,' 'The Magic Lantern,' series of stories, 'The Story of Cuchit,' 'Gobias, the Enigmatiser,' 'The Old Maiden,' 'The People Who Are Just So,' 'Gabriel the Locksmith,' or 'My Father's Daughters,' etc.

Ezra, Juan Maria (1816-), is the only writer of note who has, with the exception of Guillermo Prieto, painted truthfully and vividly the customs, thoughts and feelings of the people of Mexico. He is inclined to be humorous and to see the amusing side of life. This gives his poetry a turn which has made it popular with the masses, yet it is doubtful if they understand the depth of meaning which lies in the apparent light thought of the author.

Gonzalez, Julio (1848-) Among the modern thinkers in Mexico there is one name worthy of special mention, that of Julio Gonzalez, the author of 'Annals of Crime in Mexico.' This book is much more extensive than its title would indicate, and the author has shown an insight into the character of his people which is rare in any nation. The book is an analysis of Mexican customs, conditions, society, character and the influences which have made and tend to change them. For the student of Mexican character there is no other work as worthy of attention.

Gonzalez, Enrique Pannasson (1846-), is our acquaintance the modern Mexican advocate of correct style in poetry and prose. He is the most careful writer the republic has produced. He is artistic in all he does, and his published works are models of elegance and good taste. In addition to excellent translations from Italian, he has published two volumes of original poems, entitled: 'Myrtles,' and 'Dances.'

Gonzalez, Manuel Leonora de (1850-1911) has the honor of having led the way in the production of native drama in Mexico. His plays are skilfully arranged, the plots good and the subjects interesting. Even to-day, after almost a century, some of his works hold the native stage. The works of this writer are noted for their breadth of view and the knowledge they display of human nature while their style is popular enough to be well understood by the masses of the people yet there is behind this popularity a depth of analysis and thought, a taking philosophy which make them valuable to the student of literature.

Galvan, Ignacio Rosierum (1816-1882), a romantic, lyric and dramatic poet of great power and literary excellence, who, in his very short life, poured out a ceaseless stream of literary compositions which promised great things for the future but in the days of his promise he died leaving us an earnest of what he might have done. His best known dramas are 'Mofia,' and 'Private Secretary to the Viceroy.' His writings are characterized by a strain of melancholy, yet there is strength about his work that is noteworthy.

Lealacruza, Joaquin Garcia (1823-1893), stands in the rank of foremost Mexican writers. For a time he traveled throughout the United States with his parents, who had to leave their country on account of political troubles. Afterwards they went to Spain, where they remained until young Lealacruza was 11 years of age. It was after their return to Mexico City that the boy met Lucas Alaman, the great historian, who took a decided interest in him, and seeing that he had uncommon talent encouraged him to enter literary life, which he finally decided to do in 1846. Some of his most important works are 'Eclesiastical

that History of the Indians, 'Mexico in 1534,' 'Spiritual and Sacramental Colloquies and Sacred Poems,' 'Mexican Biography of the Sixteenth Century,' 'Fray Juan de Zamarraga, First Archbishop of Mexico,' 'Dictionary of Mexican Provincialisms,' 'The Physicians of Mexico in the Sixteenth Century.' In addition to the publication of original literary matter Icazbalceta did much for literature, and history in bringing to light many valuable writings, which he published under the titles of 'A Collection of Documents for the History of Mexico,' and 'A New Collection of Documents for the History of Mexico.'

ICAZA, FRANCISCO F. DE (1863-—), is next to Juan de Dios Peza, the Mexican poet who has received most welcome in Spain. This is probably because his writings are of that class which appeal most to the Spanish people. He is classical and correct in his diction, but his imagination is not great and he lacks the freshness of the distinctively Mexican writers in thought, imagery and style. To him the beauties of the new world have not the charm that they have for Ruiz, Rosas, Flores, Contreras and Marco.

LARREA: ISABELA PARRIS DE (1833-1896), is the most noted woman dramatist of Mexico. She was very greatly admired as a writer by the famous Spanish dramatist, Harbamburgh, who considered her one of the cleverest & most original of her day. In addition to this she was a lyric poet of note. Her dramas would fill a long list, but the most important are the following: 'Two Flowers,' 'Both are the Worst,' 'Tinsel and Gold,' 'Abnegation,' 'The School of Sisters-in-law,' 'A Lily among Thorns,' 'The Angel of the Hearth,' 'Penitence and Sin,' 'Carnival Night,' 'Fairy and Sympathy,' 'A Woman's Heart,' 'The Thorns of Sin,' and 'A Type of the Day.'

LEAÑER, JOSE JOAQUIN PEREZARTE DE (1771-1817). During his short life he attained fame as a writer and thinker and became known as "El Pensador Mexicano," the Mexican Thinker. His most noted book, which has been published and republished many times and is now considered a classic in the Spanish language is 'El Periquillo Sarmiento' one of the most thoughtful, humorous and truthful books published in Spanish. In it he analyzes every side of the human character and presents charming pictures of the various people he came across during his life. Others of his works are 'Sad Nights' and 'Fables.'

MATEOS, JUAN A. (1811-—), has great talent, strong imagination and extraordinary facility in writing. He was the first of the young writers of a generation ago to break away from the pernicious habit of Mexican literary men of imitating French and Spanish writers. Both as a novelist and a dramatist Mateos has always endeavored to make use of the material of his own country, and he has met with more than ordinary success, and the public has received with unstinted applause his efforts to create a national drama. But most of the actors in Mexico are Spanish, and they have made a determined war against the innovations of Mateos, Chavero, and Pezu Contreras, advocates of a Mexican national drama, and they have almost succeeded in driving from the stage the works of these older dramatists, which is to be regretted, for the works of Mateos, Chavero, Pezu and Contreras are certainly superior to the Spanish comedies that now hold the boards on the Mexican stage. The government recognizes this and is now doing all it can to encourage the native dramatists and actors. Mateos' most successful dramatic work is a play called 'The Other One.'

MIGON, SALVADOR DIAZ (1893-—), as an orator and poet has many admirers in Mexico. He has a fervid imagination, and his lyrical compositions are among the best written in the republic. He has a deep sense of the beauty of rhythm and imagery, and is, therefore, more a poet for poets than for the masses.

MORALES, MELISSA (1838-—) has an international reputation as a writer of lyrical drama, and his productions are quite popular on the continent, especially in Spain and Italy. In the latter country all his operatic productions and other music are printed and have much popularity. He has the honor of being the author of the first opera written in the new and renowned with success in the old world. Among his best known operas are 'Ramo and Juhri,' and 'Idiogonda.' Morales was the master spirit behind the establishment of the National Conservatory of Music in Mexico City, which has done much for musical education in Mexico. In memory of his labors in the cause of higher music, various musical societies have been named after him.

NOGARA, MARCEL GERVINCE (1850-1895) known under his nom de plume as the "Duke Joh," was noted as a painter, a sculptor, a journalist and a poet. He retains his reputation as an artist would paint a picture. He is one of the most facile writers in the long range of Mexican literary men. He changes from one subject to another without apparent effort and his style

insensibly changes itself to suit the subject he has to handle. By Mexican critics he is claimed among the six greatest literary men of Mexico in the 19th century.

OGA, ISACIO MONTES DE (1840-—), bishop of San Luis Potosi, has had a most varied career. At the age of 12 he was sent to school in England, where he remained four years. Then he went to Rome to finish his theological education. He served as parish priest in Ipswich, England, was chaplain to Mauntzian, and later secret chancellor to Pope Pius IX. Montes de Oca, who writes under the nom de plume of "Isandro Aotico," is a poet of international reputation and a prose writer of ability. Three books of poems of this author have been published in both Mexico and Madrid, namely: 'Poems,' 'Loterings,' 'Pader's Odes,' and 'Greek Burns Poets.' His prose works comprise six large volumes of sermons, orations and pastoral subjects.

OLASOON, LUIS GONZALEZ (1865-—), may be termed the antiquarian historian of Mexico. His methods of work are different from those of most other historians. He loves to take some incident, character or period in history and elaborate it filling in all the details and making a most complete picture in which the figures in the foreground stand out in full relief. His works have been published in Mexico, Spain and France. Of these his best known literary effort is 'Old Mexico,' which is a series of vivid pen pictures of old Mexican customs, characters and incidents. At present Mr. Olasoon is the editor of the publications of the National Museum.

ORRIS, LUIS G. (1835-1894), was the author of two large volumes of poems and several novels. His style is smooth and lyrical. By his admirers he has been compared to Petrarch, and, in fact, he was a great student of the Italian poets whom he imitated to a considerable extent in his younger days.

OTON, MARCOA JOSE (1858-—) is a dramatist of note and a lyric poet. Among his dramas, a number of which have been most successfully produced, are: 'A Wounded Heart,' 'A Chain of Pearls,' 'The Shadow on the Hearth,' 'After Death,' 'What is There Behind Happiness,' 'March' and 'Victory.' Good plots, plenty of action, breadth of view and imagination distinguish the work of Othon in the dramatic line and have gained for him a welcome among lovers of the drama.

PALACIO VACARIS RIVA (1828-—). There was heroic blood in his veins, for his father was the patriot leader Mariano Riva Palacio, and his mother, Dolores Contreras, daughter of the great liberal leader and the hero of Mexican independence, Vicente Contreras. Riva Palacio held many important political offices, all of which he administered with talent and energy, and he fought through the war of the reform, in which he distinguished himself as a military leader. Riva Palacio's literary life has been as active and even more successful than his military and civic life. He has published dramas, novels, comedies, stories, essays, poems, legends, all in correct and diversified style, which has made him one of the most popular and, at the same time, trenchant writers that Mexico has produced. As a literary critic Riva Palacio is undoubtedly the best Mexico has produced. He has a keen appreciation of the literary value of a book, poem or play, and a most entertaining and vivid style, which make his criticisms as entertaining as a more sonorous article from a less gifted writer. As an indication of the esteem in which Riva Palacio was held, it is only necessary to mention the fact that he was an honorary member of some thirty literary and scientific societies in Mexico Central and South America, and Europe.

PAYNO, MARCEL (1828-—). He has held many important military and civic offices and was secretary of the treasury under two administrations. As finance minister he reduced the debt of the republic to twenty millions. Payno has been imprisoned for his political opinions and was, on more than one occasion, in danger of losing his life. Later on he was appointed Mexican consul general in Spain. Payno is noted for the fervency and clearness of his literary style. Some of his descriptions are room poems in which his vivid imagination creates wonderfully realistic pictures. Notwithstanding the heavy burdens of his public offices, he has written more and better than many men who have devoted all the energies of their lives to literary pursuits. He has produced history, biography, political treatises and several excellent novels. The work for which he is best known is 'The Devil's Great Sin.' But the book which will have most interest to foreigners is 'The War Between Mexico and the United States.' Many literary honors have come to Payno both from Mexico and from foreign countries.

PEZU, JUAN. The extraordinary life of Franco Pezu reads like a romance. He worked his way through the university, he fought in the war of reform, and in that of the French intervention and, at the same

MEXICO — AGRICULTURE

time, he wrote energetically for the press, denouncing the French in no measured terms, and his work did a great deal to strengthen the resistance of the Mexican people against the French invaders. When General Diaz rose in arms Iremio Paz was at his side. In a most interesting book, "Some Campaigns," he has given an account of the many adventures of himself and his companions during these unsettled times. After the war Iremio Paz soon became noted as a journalist, poet, novelist, dramatist and short story writer. Several of his comedies were very popular. One of these, the "Apple of Discord," is very bright from beginning to end and it is still a favorite on the Mexican stage. Mr. Paz is editor and owner of "La Patria," one of the best known dailies of the capital.

PANZOS, JOSE JOAQUIN (1861-1881), is the classical poet of Mexico. He is noted for the purity of his style, his choice of language and the wonderful execution of his literary pictures. In his day he was on intimate terms with the greatest of Spanish poets, who looked upon him as a worthy brother in literature. The famous poets Zorrilla, Martinez de la Rosa, and Herreras were constituted in their praise of the "new star in the horizon of Mexican literature."

PAZ, JUAN DE DIOS (1832-), is the best known of all the living Mexican poets. He was graduated in medicine, but drifted into journalism, and soon became known as one of the most clever newspaper men in the republic and as a poet whose writings appealed to the mass of the people. In rapid succession he published three dramas, which are widely read: "The True Home," "The Last Days of Christopher Columbus," and "A Love Affair." In 1876 he awoke one day to find himself famous, and since the death of Guillermo Prieto, a few years ago, he has been the literary leader in the capital. As a result of his literary fame he was sent to Spain as secretary of the Mexican legation. His fame as a poet and dramatist has been steadily growing, and most of his best work has been translated in different European languages, and in Mexico there have been more and better editions of his works published than of those of any other living author. Editions of his works have also been published in Madrid, Paris, and Philadelphia. Paz is also a master of prose and one of the best orators of Mexico. A few of his most popular works are: "Songs of the Heart," "Home and Country," "The Arrow of Love," "Memories and Hopes," "Flowers of the Soul," "Legends of the Streets of Mexico," "The Harp of Our Native Land," "The Mexican Lyre," "Mexican Traditions," and "Monologues of Nostalgia and Melancholy."

PRIO, GUILLERMO (1818-88-), is the master poet of Mexico. He has better sounded the depths of the human heart, he has painted better the Mexican character, and appealed more to the masses than any other native writer. As a poet, Prieto has cultivated the ode and the romance. His mastery of the former has revealed him as a great poet, his success in the latter has made him the most popular poet of Mexico, not even excepting Juan De Dios Paz. Prieto is the only Mexican poet who has successfully painted the customs of the Mexican people of all classes and the traditions of Mexican history in a popular manner. He was the first to form traditions of glory for a people which had been occupied in struggling and quarrelling within itself. He called the people out of its darkness and made his cry the glory of Mexico.—Mexico united and great. This is why he has struck the deepest chord in the Mexican heart, so that, before his death, the old man was raised almost to the pinnacle of a saint by the middle and lower classes. He is a satirical and romantic poet, and his chief work is "El Romancero Nacional." During his long life Prieto was continually associated with the political events of the history of his times, and he was more than once in exile for his political opinions.

RIVERA, AGUSTIN (1824-), studied law and theology, and was graduated both as a priest and as a lawyer. On account of these qualifications he became the attorney for the Ecclesiastical Curia. He has published in the neighborhood of a hundred books and pamphlets, among the best known of which are his "History of Ancient Mexico," "Critical Observations upon the Vice Royalty of New Spain," "Principles of Criticism," "The Philosophy of New Spain." But his writing covers a very wide literary field and he has come to be looked upon as the most fearless, and, at the same time, judicious and clear headed writer in Mexico. In 1901 the national government passed a bill granting him a pension in recognition of his constant labors in the cause of literature, culture and truth. Many of his works have been published in Spain, and they are read in all Spanish-speaking countries.

RUZ, EDUARDO (1832-), is a charming story teller. In addition to a work on constitutional law, which has become a text-book, he has written "A History of the War of Intervention in Michoacan," "Land-

scapes," "Traditions and Legends," and "Legends of Michoacan." In these he handles, with a most sympathetic touch and clear insight, the stories of the people.

SANNA, JUSTO (1848-). Of all the literary men in Mexico, Justo Sierra exemplifies best the general tendency of Mexican literature. The whole temperament of the man would lead him to adopt a literary life, yet his surroundings have made of him a politician, a public speaker and an educator. His father was one of the most distinguished literary men of Yucatan, and young Sierra early showed a decided literary bent. He graduated in law and at the age of 24 was chief secretary to the supreme court of the nation. Since then he has been in succession, a member of Congress, magistrate of the supreme court and minister to Madrid. He is now minister of education for the Republic of Mexico. Justo has the reputation of being the best orator in Mexico, and is widely known as a poet, novelist, and historian. His "General History" and "History of Mexico" are both standard works.

SOLIS, JUAN F. MOLINA (1830-), lawyer, professor, journalist, and author, is one of the most vivid and thorough historians whom Mexico has produced. His "History of the Discovery and Conquest of Yucatan," and "Summary of the Ancient History of the Peninsula," have an international reputation. He has written much on political subjects, and always with conservatism, lucidity, and conciseness.

SOUTHWORTH, JOHN R. F.R.S.E., well-known author of "The Mines of Mexico," the "Bankers' Official Directory of Mexico," "The Haciendas of Mexico," and seven large, illustrated volumes, descriptive and statistical, on the Mexican states of Yucatan, Vera Cruz, Puebla, Oaxaca, Sonora, Sinaloa, Lower California, and the Federal District.

TARLADO, JOSE JUAN (1871-), is perhaps the most discussed of the younger poets in Mexico on account of his defiance of most of the tenets of the poetical schools of the day. He is oriental in his tastes, his coloring and his pictures, but, at the same time, he is original, imaginative, and lyrical.

TALBOT, EDITH HOLMESWORTH (1830-), founder and many years editor of the "Railway Age," Chicago and New York, a life long member of the American press, author of "Commercial and Industrial Mexico at the Close of 1906," and for 20 years past writer on various Mexican topics.

UNIVA, LUIS G. (1868-), is the youngest advocate of the romantic school of poetry in Mexico, and, as such, is looked upon by the older writers as the most promising young poet of the republic. His imagination is vivid, his style fluent and graceful, and he looks at life from the view of a man who sees far and clearly. He ought to produce better things than the already excellent work he has done.

VIGIL, JOSE MARIA (1830-), librarian of the National Library of Mexico, has had a most varied career, during part of which he edited, in San Francisco, "The New World," a reform newspaper. He is one of the oldest living literary men of Mexico, and it is now over 30 years since he first entered political life, during all of which time he has never taken off the harness. Yet, notwithstanding this, he has been one of the most prolific writers this country has produced. One of his dramas, "Dulce," has been repeatedly upon the boards, and, for a time, was quite popular. In "Flowers from Anahuac" Mr. Vigil has published dramas and poems which are placed in the front rank by Mexican critics. In addition to this he wrote the fifth volume of "Mexico Throughout the Centuries." This volume treats of the reform period in Mexico. Mr. Vigil has influenced political thought probably more than any other writer in Mexico. He has also been an educator of note and was professor of logic in the semi-university.—"The National Preparatory School of Mexico." He is a member of all the important scientific and literary societies of Mexico and also of a number on the continent of Europe.

ZARAGOZA, AUGUSTO (1833-), belongs to the same school as Juan De Dios Paz, Flores and Acuña. His work is characterized by fervid imagination and that lyrical, mystical poetic quality which distinguished Acuña above his fellow poets. On the publication of his first volume of poems Zaragoza at once became famous, and has ever since held his place as one of the foremost poets that Mexico has produced. He has published several volumes of poems, all of the same class.

JOHN H. CORRYN.

Director Mexico City Grammar and High School.

8. Mexico — Agriculture. Until recent years agriculture in Mexico, except as engaged in by a comparatively few,—the owners of vast

MEXICO — AGRICULTURE

haciendas or estates,—and by these in a most imperfect way, was sadly neglected. Mining occupied the centre of the stage to the practical exclusion of all other great interests. But this was not the only obstacle; the difficulty of obtaining land except in large tracts, the indisposition of the owners of the great haciendas to dispose of all or even a part of their vast holdings; the fact that land not under cultivation is not taxed; the prejudice of the native working farmers against adopting modern methods; the lack of satisfactory means of transportation; the almost entire absence of immigration from the agricultural communities of other countries, and various other causes had contributed to the practically universal lack of interest in farming as a business. Now, however, the country is awakening to the fact that agriculture is quite as important as mining, in the great work of material development; and modern machinery and methods are rapidly driving the wooden plow and its companion implements of past ages into deserved obscurity. In fact, the industrial statistics of the republic indicate a growth of this industry in the last few years quite as remarkable and as promising for the future as has been the growth of mining. In every section penetrated by the railway and the spirit of progress, the old is giving way to the new, and results are amply proving that Mexico will in time occupy quite as prominent a place among the agricultural countries of the world as among those noted for their mineral wealth.

Agricultural Products.—In 1903 the principal agricultural products were:

Rice	\$2,928,693
Corn	82,164,962
Coffee	11,440,515
Vanilla beans	758,693
Cotton	7,911,685
Sugar	15,742,325
Brandy from cane	10,933,742
Brandy from grapes	115,941
Brandy from corn	635,516
Indigo	176,032
Chili peppers, dried	2,296,888
Chili peppers, green	5,810,298
Garbanzos, peas for hogs	1,469,302
Little	2,953,213
Mescal, liquor from the Maguey plant	1,344,934
Barley	6,641,181
Wheat	19,335,784
Tobacco	4,541,581
Henequen	41,087,852
Chick peas	2,377,075
Cacao	1,388,634
Tequila, brandy from the Maguey plant	2,139,370
Wine from grapes	184,300
Peanuts	633,744
Sweet potatoes	646,051
Frijoles, table beans	10,175,930
Habas, another variety of bean	2,590,357
Lentils	110,587
Molasses	6,477,374
Irish potatoes	713,236
Rye	166,577
Oats	24,898
Common pulque	3,531,539
Superior pulque	9,489,374
Syrup from cane	2,219,014

The total value of the 57 varieties of fruits produced in the republic in 1903 was \$6,700,000, and of the 30 varieties of vegetables, \$1,588,000. There were 8,083 haciendas or large farms, 34,958 ranches or small farms and 109,378 unclassified. There were employed on these farms of all classes, 1,425,135 laborers, of whom 1,358,165

were males and 66,970 were females. Number of hectares of land under cultivation and not irrigated, 10,605,887; irrigated, 1,550,980; in pasture 48,762,849; timber land 17,786,715. It is estimated that in 1900 there were in the entire republic, 479 square leagues of thick forests, 18,134 square leagues of ordinary wooded land, and 40,833 leagues of uncultivated land. The area especially suited for the cultivation of wheat is estimated at 52,000 square miles, and includes the States of Michoacan, Mexico, Chihuahua, Puebla, Jalisco, Guanajuato, Aguascalientes, San Luis Potosi, Coahuila, Queretaro and Zacatecas. In these States three crops can be successfully grown in two years, averaging 20 bushels to the acre each. With the aid of irrigation, not only this grain but all others can be successfully grown in very nearly all parts of the republic.

From 1897 to 1901, inclusive, the total production of corn in Mexico was 472,549,643 bushels, valued at \$431,908,840. In the last year named, the highest price realized (\$3.18 per bushel) was reported from the State of Tamaulipas, and the lowest (.53c. per bushel) from the Territory of Tepic. The higher figure named was due to a corner and the lower chiefly to a lack of proper transportation. The leading corn States in 1903, as per official reports, were: Jalisco, \$8,770,076; San Luis Potosi, \$7,843,751; Guanajuato, \$7,650,807; Veracruz, \$6,942,562; Puebla, \$5,315,948; Mexico, \$4,844,803; Guerrero, \$4,359,823; Michoacan, \$4,325,706; Durango, \$3,343,226; Hidalgo, \$3,037,027; Queretaro, \$2,951,388; Zacatecas, \$2,917,267.

The leading wheat states were: Guanajuato, \$3,634,749; Michoacan, \$3,617,792; Puebla, \$3,095,199; Coahuila, \$1,803,870; Queretaro, \$1,052,460; Mexico, \$1,385,122; Chihuahua, \$1,039,482; Tlaxcala, \$1,027,775.

The leading tobacco states were: Veracruz, \$2,142,005; Oaxaca, \$759,284; Hidalgo, \$408,761; Chiapas, \$383,990. *Vanilla*: Puebla, \$428,833; Veracruz, \$328,400. *Fine pulque*: Tlaxcala, \$3,524,550; Hidalgo, \$3,025,382; Mexico, \$2,504,766. *Henequen*: Yucatan, \$29,563,524; Campeche, \$11,481,597. *Haba beans*: Michoacan, \$1,219,742; Mexico, \$1,005,206. *Frijoles*: Veracruz, \$1,290,574; Puebla, \$1,263,978; Jalisco, \$996,337. *Sugar cane*: Veracruz, \$5,369,577; Morelos, \$1,230,184; Puebla, \$945,895. *Barley*: Mexico, \$2,648,934; Puebla, \$1,423,709; Hidalgo, \$827,628. *Coffee*: Veracruz, \$7,825,387; Chiapas, \$1,698,797; Oaxaca, \$542,762; Cacao: Tabasco, \$751,866; Chiapas, \$610,897. *Sugar*: Morelos, \$6,432,597; Veracruz, \$3,104,269; Michoacan, \$1,363,099; Puebla, \$1,174,940; Jalisco, \$966,825. *Rice*: Morelos, \$934,568; Michoacan, \$560,613; Puebla, \$457,462; Veracruz, \$370,111. *Cotton*: Coahuila, \$5,260,332; Durango, \$1,772,864. *Brandy from sugar cane*: Jalisco, \$3,503,847; Veracruz, \$2,900,120; Morelos, \$1,123,826; Puebla, \$684,128.

Live Stock.—The live stock industry has experienced important growth in the past few years, present indications leaving no doubt that it is destined to become, in the near future, one of the most profitable in the republic. As far back as 1883, there "roamed over an area of 300,000 square miles in the northern part of the country," according to a well known writer,

MEXICO.

RAMON CORRAL,
Vice-President and Secretary of the Interior.

Photo by Clark, Mexico

MEXICO -- AGRICULTURE

"1,500,000 cattle, 2,500,000 goats, 1,000,000 sheep, 1,000,000 horses and 500,000 mules, and there were 20,574 cattle ranches in the republic, valued at \$515,000,000." Between the cities of Jalapa and Veracruz, and between Veracruz and Cordoba, great numbers of cattle are to be seen from passing railway trains, their sleek and well rounded sides testifying to the excellence of the grasses which are indigenous to the soil of that favored section of the republic. And this is only an illustration of similar scenes in other sections of the same state, and for that matter in most parts of the country.

The Great Estates.—The principal agricultural need of Mexico, and which may be considered an offset to the wonderful natural advantages of soil and climate, is the division and subdivision of the great estates which, from the picturesque point of view, have long been and unfortunately still continue to be one of the country's most interesting characteristics. It is not possible for any country, however favored by nature, to even approximately reach its agricultural possibilities so long as its most productive lands are held in enormous tracts by a few wealthy "hacendados" who only cultivate an infinitesimal part of their holdings and have neither need nor ambition to make each acre produce close up to the limit of its capability. The "farms" of Mexico, under existing conditions are really princely estates, frequently numbering their acres far up into the hundreds of thousands, while not producing a tenth part of the returns possible under the system prevailing in agricultural communities which have really become rich and have added their proper quota to the wealth of the world. Their owners are loth to dispose of any part of their holdings, which in most cases, have descended from father to son through a long line, and have come to be regarded as inseparable from the family name or proprietorship. Herein is found one of the chief reasons why so few practical farmers of moderate means emigrate to Mexico. They are neither able nor disposed to buy a great "hacienda," and it is not possible for them to secure desirable land in small quantities and favorable localities under existing conditions, except by combining as a colony, purchasing a large tract and dividing it into farms suited to individual requirements.

Public Lands.—There are still government or public lands to be had, but most of these are somewhat removed from the advantages of railway communication, a favorable market and social and educational privileges. Some 25,000,000 acres of public lands yet remain to be disposed of, the prices of which are annually fixed by the government. For the fiscal year 1905-06 these were as follows, by states and territories, per hectara (2.471 acres):

Aguascalientes	\$2 25
Campeche	1 80
Coahuila	1 00
Colima	2 25
Chiapas	2 00
Chihuahua	1 00
Durango	1 00
Guanajuato	3 35
Guerrero	1 10
Hidalgo	2 25
Jalisco	2 25
Mexico	3 35
Michoacan	2 25
Morelos	4 50

Nuevo Leon	\$1 00
Oaxaca	1 10
Puebla	3 35
Queretaro	3 35
San Luis Potosi	2 25
Sinaloa	1 10
Sonora	1 00
Tabasco	2 50
Tamaulipas	1 00
Tlaxcala	2 25
Veracruz	2 25
Yucatan	1 80
Zacatecas	2 25
Federal District	5 00
Territory of Tepic	3 00
Territory of Lower California	65

Until the close of the War of Independence these lands were held by the Spanish Crown or the Catholic Church.

Country Property.—In the year 1903 the government reported the value of rustic or country property in the several states and territories, as follows:

Aguascalientes	\$3,610,961 77
Campeche	2,455,064 31
Coahuila	9,719,942 00
Colima	2,486,532 00
Chiapas	23,774,129 00
Chihuahua	6,982,032 00
Durango	15,925,915 00
Guanajuato	33,534,025 06
Guerrero	5,211,575 00
Hidalgo	18,713,773 76
Jalisco	52,138,778 00
Mexico	32,782,127 00
Michoacan	25,599,481 00
Morelos	7,314,023 24
Nuevo Leon	7,670,564 43
Oaxaca	17,200,479 98
Puebla	35,583,806 56
Queretaro	11,997,329 00
San Luis Potosi	17,500,000 00
Sinaloa	5,595,000 00
Sonora	5,743,457 85
Tabasco	2,168,735 16
Tamaulipas	2,413,076 00
Tlaxcala	8,113,497 94
Veracruz	60,960,895 92
Yucatan	13,141,668 66
Zacatecas	16,339,004 66
Territory of Tepic	3,960,513 28
Lower California	3,723,702 25
Federal District	37,400,658 40

It is probably safe to mark this total valuation of country property (\$503,258,640.33) up to \$600,000,000, if not, indeed, to \$700,000,000 at the end of 1906, as the three years that have passed since the foregoing table was prepared have witnessed greater advance in real estate value throughout the republic than have any preceding six years.

Surveying the Land.—It is remarkable, under the circumstances of prolonged Spanish control and succeeding revolutions and rapid changes of government, that in Mexico land titles are probably as nearly invulnerable as in any other part of the world. When this country came into her own she soon realized that she had indeed inherited a wealth of uncertainties and an embarrassment of riches. Spain had regarded herself as the owner of all the land and had by virtue of this assumption granted it in princely tracts to favorites, regardless of the rights of others. As a means of avoiding the enormous cost of surveying, the government adopted the plan of contracting with private parties to survey it for one-third of the amount surveyed. Up to 1892 there had been surveyed under this plan, 50,631,665 hectares, or almost 127,000,000 acres, and many

MEXICO—AGRICULTURE

other millions have since been added to this total. At this time the work is being actively prosecuted by an American company in some of the west coast states, and will doubtless be pushed to completion as rapidly as possible.

Immigration.—As far back as 1837 Mexico began to encourage immigration, but no practical or really serious efforts in this direction were made until 1882. The present colonization law was enacted in 1885. But, for the reasons herein-before given, the effort has not thus far been nearly as successful as climatic, soil and other natural advantages justified.

Chief Industries.—A brief reference to the chief features of the agricultural industry of the country will prove instructive and interesting.

Sugar.—Although not enough sugar is yet produced for home consumption the industry is growing quite rapidly and will soon contribute materially to the volume of the country's exports. The greater part of the cane is grown at altitudes above 2,000 feet, but the best results are obtained in the lower country, where it matures sooner, and where it may be cut twice annually without necessitating replanting more than once in upwards of ten years. In the Cuernavaca valley, state of Morelos, the first sugar estates were cultivated by negro slaves, bought at Veracruz, at from \$300 to \$400 each. But the experiment proved unsatisfactory, and free labor was soon substituted. Now the plantations are worked chiefly by Mexican labor, the mills are supplied with modern machinery, and the quality of the product is rapidly advancing to the front rank in quality.

Tobacco.—This industry is also developing great possibilities. The climatic and soil conditions, especially in the tropics, are very favorable to the best results, and whereas in Cuba the soil, after 400 years of constant use has become comparatively unproductive, in Mexico no artificial stimulant is needed, and the flavor and aroma of the tobacco are conceded to be superior to those of the Cuban product. The chief tobacco states are Veracruz, Oaxaca, Hidalgo and Chiapas.

India Rubber.—While there has been much unsatisfactory experimentation with the rubber tree, the failures have generally been chargeable to lack of knowledge or experience or to the introduction of illegitimate speculation at the expense of practical results. As an illustration of the possibilities of proper methods, reference is made to a well known rubber plantation in the state of Oaxaca, consisting of 200,000 trees now 16 years old, which yielded a first crop valued at \$120,000, and, according to a distinguished Mexican authority, "the net profit on the investment, after deducting entire cost of the land and all expenses up to the first year of harvesting (five years), has been over \$100,000 a year," or more than 400 per cent. Quite recently it was discovered that a plant known as the Guayule, which is indigenous to the northern states of the republic, growing wild in enormous quantities, can be profitably utilized in the manufacture of rubber, and already many factories have been established and a large amount of capital invested in the new enterprise. The Guayule rubber, however, does not yet command as high a price as the other, though it seems likely to work quite a revolution in the industry.

Agave or Maguey.—This plant, from which is extracted the drink known as pulque, a white juice having the appearance of milk, which the natives use in immense quantities, is perhaps the most important feature of the agricultural interest of the central plateau. Although pulque contains only about 7 per cent. of alcohol, it is intoxicating when drunk in large quantities. It possesses important medicinal qualities, is a tonic and very nutritive. From 350 to 700 agave or maguey plants to the acre are planted. They mature in 8 years and give milk for a period of about five months, producing from 125 to 160 gallons of pulque each. The plants cost about \$2 each by the time they have matured, and give a return of from \$7 to \$10 each. The pulque is secured by making a cavity in the centre of the plant, from the top, large enough to hold a few quarts, and is drawn out by rude syphons once a day. The leaves of the plants sometimes grow to be 12 feet long and weigh from 25 pounds to 100 pounds each.

Banana.—This fruit is successfully grown everywhere in Mexico between sea level and an altitude of 5,000 feet. It is easily cultivated and very profitable. Frequently a return of \$1,000 is realized from an outlay of \$500 in a single season. A plantation of 1,000 trees, costing \$500 will, under favorable conditions, earn this amount, even though, as at present, the methods used may be faulty, the care exercised insufficient, and the variety poor. Realizing the importance of material improvement in these and other details of the industry, the government has recently taken measures to bring about such a result as speedily as possible. Heretofore, these details have been generally and sadly neglected, resulting in the production of many varieties of the fruit at the expense of quality, reputation, and foreign demand, as well as of home appreciation. A favorable feature of banana growing is the fact that the ground occupied by the trees may also be utilized at the same time for the cultivation of coffee or other profitable products. Few other tropical fruits develop and become profitable as quickly as does the banana. Especially agreeable are some of the smaller varieties, although they may not be as much sought after as the larger and more pretentious ones. Their flavor possesses qualities not found in any other known variety.

Orange.—The oranges of Mexico are rapidly and surely winning favor in the markets of the north. Their true worth has only recently come to be understood and appreciated by consumers. It is not difficult to imagine the resulting increase of this popularity when the improved methods of cultivation now being introduced by expert horticulturists under direction of the government, have had time for fruition. Up to this time, neglect of pretty nearly every detail of the industry has been the rule, and even ordinary care has been the exception. Although the orange finds favorable conditions in all the tropical and sub-tropical states, the best results thus far appear to have been attained on the shores of Lake Chapala, in the state of Jalisco, and in Veracruz, Yucatan, Michoacan, Sonora, Morelos, Durango, Nuevo Leon, Oaxaca and Puebla. The leading pro-

MEXICO—AGRICULTURE

ducers in 1903 were: Jalisco, \$211,600; Yucatan, \$118,971; Michoacan, \$92,563; Sonora, \$52,283; Morelos, \$51,246; Durango, \$45,938; Nuevo Leon, \$45,249; Oaxaca, \$37,240; Puebla, \$15,158; Sinaloa, \$25,670, and Hidalgo, \$24,938. Veracruz did not report. Although the oranges of La Barea, in the state of Jalisco, are considered the best now being produced in the republic, they must in due time find competitors worthy of recognition in the product of Michoacan, Veracruz, Morelos, and other localities equally favored by Nature and only requiring reasonable care and approved methods of cultivation. The best results are secured at elevations below 2,500 feet. The trees begin bearing when three or four years old and increase until the 12th or 15th year. Frost never occurs in any of the orange growing states.

Lemon.—It is doubtful if any product indigenous to the soil of Mexico has been as sadly neglected as the lemon. So largely has it been relegated toward the lower end of the list of tropical fruits, in favor of the lime, that it can with difficulty be obtained in the markets, and when found is generally unsatisfactory in quality. And this, notwithstanding the existing very favorable conditions of soil and climate and the increasing demand in the world's markets. According to government reports the little state of Morelos produced \$60,627 worth of lemons in 1903, out of a grand total of \$101,827 worth for the entire republic. But one other state (Yucatan), exceeded \$10,000 worth, its product being valued at \$12,200.

Limes.—This remarkably successful rival of the lemon, in Mexico, is grown chiefly in the states of Guanajuato, Puebla, Michoacan, Mexico, Jalisco, Oaxaca, Guerrero and San Luis Potosi. Twenty-two states produced \$145,841 worth in 1903, according to government reports, which, however, do not include Veracruz. Of this amount Guanajuato is credited with \$45,021. The lime of Mexico is of very excellent quality, but like the lemon and the orange, can be greatly improved by the adoption of proper methods of cultivation and the exercise of reasonable care.

Pineapple.—In the production of this fruit Mexico excels and is constantly advancing. The towns of Cordoba and Amatlan, in the state of Veracruz, have long been noted for the size and quality of the pineapple grown in the regions round about them. The fruit is also successfully grown in the states of Puebla, Hidalgo, Tabasco, Chiapas, Oaxaca, Morelos, Guerrero, Michoacan, Colima, and Jalisco, and the territory of Tepic. It prospers most at elevations of 2,000 to 3,000 feet. Was cultivated before the conquest. Its leaves have for centuries been utilized to a greater or less extent in the manufacture, though by crude methods, of rope, twine, thread, mats, bagging, hammocks, paper, and cloth of various colors. The value of pineapples grown in 1903 is officially given as \$24,932, the chief producers named in the official reports being the territory of Tepic and the states of Hidalgo and Tabasco. Again the state of Veracruz is omitted, notwithstanding that its product doubtless excels that of the rest of the republic. The industry, when intelligently conducted is very profitable.

Other Products.—Included in the general category of agricultural products and of the numerous other articles closely allied to them, which are or can be successfully cultivated in Mexico, may be mentioned the yucca, or staroh plant, which is said to contain six times as much nutritive matter as wheat, and which is grown principally in the states of Veracruz, Oaxaca, Chiapas, Tabasco and Yucatan; chicle, or chewing gum, of which over \$1,000,000 worth has been exported to the United States in a single year; the mango, one variety of which (the Manilla) seems to combine about all the more delicate and delicious flavors of all the choice fruits of the world, but which, being very perishable, cannot be transported a great distance without suffering serious depreciation in value. The apple, peach, and pear are all grown in various parts of the republic, but neither has yet been brought up to anything like the standard of excellence reached in the United States, notwithstanding that almost all the natural conditions are exceptionally favorable.

Vegetables.—The same remark applies to vegetables as to fruits which are not properly cultivated and the varieties of which have never been improved in the slightest degree, but have deteriorated from year to year. There is absolutely no reason why practically everything grown in other countries, whether tropical, subtropical or temperate, cannot be grown in Mexico with equal or even greater success.

Stock-raising.—The plains of northern Mexico and the valleys of the southern portion offer most favorable opportunity for profitably engaging in the live stock business. The climatic and other conditions are very favorable, the grasses are most nutritious. The transportation rates and facilities are such that cattle can be raised in Mexico and shipped to the markets of the United States at a good profit. An idea of the increase of this industry in Mexico may be gained from the reports by the government of the number exported annually, and which show a regular and very considerable increase. The Para grass of the southern Mexican states is always green, grows luxuriantly and is very nourishing. It is estimated that an acre of this, if cut, will feed two head of stock the year round, and that three acres in pasture will fatten four head. Weeds will not grow with it. Because of the great number of flies and ticks in the low country, very young stock thrives better on the higher plains of Durango, Chihuahua, Michoacan, etc. Taken as a whole, Mexico has an abundance of sustenance to provide for an enormous increase of her present supply of live stock of every kind. According to the Bureau of American Republics, the states of Durango, Sonora, Chihuahua, Nuevo Leon, Coahuila, Tamaulipas, Veracruz, and Michoacan constitute "an admirable field for the carrying on of the cattle industry." That the government of Mexico earnestly desires to encourage this industry in a general way, and more especially to bring about the material improvement of the native stock of every description, from horses and cattle down the long line to turkeys and chickens, has been evidenced in many practical ways. Therefore there is every reason to an-

ticipate for it a most prosperous and progressive future.

Cotton.—This industry is confined to the following states, which in the last year reported by the government, gave the results here stated: Coahuila, \$5,260,332; Durango, \$1,772,864; Veracruz, \$173,715; Tamaulipas, \$157,419; Guerrero, \$148,145; Chihuahua, \$142,680; Oaxaca, \$100,612; territory of Tepic, \$55,303; Sonora, \$41,500; Sinaloa, \$18,460; Michoacan, \$16,002; Chiapas, \$16,100. While the natural conditions and possibilities seem to favor the rapid development of the cotton industry in most or all of the states named, it is probable that lack of thoroughness and a disinclination to adopt the most modern methods will greatly delay the accomplishment of best results. Only about half the raw cotton required by the mills of the republic is grown within its boundaries.

Corn.—The fact that in the year 1903 Mexico produced almost \$100,000,000 worth of corn leaves no doubt of its adaptability to the cultivation of this grain. Although it is the "staff of life" with the common people, but little is ground into meal, as in the United States, the mass of consumers preferring the old way of grinding for themselves what they require, on the rough surface of the ancient stone "matate," with the aid of a "rolling pin" of the same material. Neither the ears nor the grain of Mexican corn grow as large as does the corn of the United States, but the quality is excellent, all the more important elements of nutrition and flavor being present.

Wheat.—As the masses in Mexico seldom indulge in wheat bread or other articles of food composed of wheat flour, this grain does not receive the attention that is bestowed upon it in other countries. Its use is almost wholly confined to the wealthy and upper middle classes. While the quality is hardly equal to that of the recognized wheat countries, it is very good and no doubt can, through modern methods of cultivation, the exercise of proper care, and reasonable attention to the securing of varieties which are best adapted to the soil and climatic conditions, be brought up to the highest standard of merit.

Alfalfa.—This is a luxuriant grower in almost every part of the republic,—especially when cultivated by irrigation,—and is a very profitable industry. In many regions several crops can be successfully grown in a single year. In fact the prevailing conditions of soil and climate are very favorable, not only to alfalfa, but to almost all fattening grasses as well.

Rice.—This grows well in Mexico without inundation. The total production in 1903 was officially valued at \$3,000,000. Of this amount \$934,568 was realized by the state of Morelos, \$560,613 by Michoacan, \$457,462 by Puebla, \$370,111 by Veracruz, \$194,026 by Colima, and \$109,647 by the territory of Tepic. The other rice states, in the order of amount produced, were Jalisco, Chiapas, Tabasco, Guerrero, Tamaulipas, Oaxaca, and San Luis Potosi.

Coffee.—One of the leading products of the country and very profitable when cultivated, harvested and prepared for the market, by persons of experience who are actuated by the sole desire to secure the best possible results rather

than to speculate by selling partly grown plantations to ignorant purchasers for several times their actual value. The value of the product for 1903 was \$11,440,515, of which Veracruz produced \$7,825,387; Chiapas, \$1,698,797; Oaxaca, \$542,762; San Luis Potosi, \$369,745; territory of Tepic, \$199,225; Tabasco, \$165,110; and Hidalgo, \$109,979; the other coffee states bringing up the rear in the following order of production: Jalisco, Michoacan, Morelos, Guerrero, Mexico and Colima. The quality of Mexican coffee has been materially improved in recent years, and is now most highly regarded in the markets and at the fairs of the world. Many Americans are engaged in its cultivation,—especially in the state of Veracruz.

Cacao.—In Colonial days the cultivation of cacao received greater attention than is now given it. So highly prized was the product of the state of Chiapas at that time, that it is said that it was exclusively used by the royal family of Spain, by whom it was considered the best in the world. In 1903 the state of Chiapas produced cacao valued at \$761,320 and Tabasco \$931,596, the entire remainder, amounting to but \$21,350 being divided according to amount produced, between the states of Veracruz, Michoacan, Guerrero, Oaxaca, Puebla and the territory of Tepic.

Vanilla.—The former profitability of this industry has been greatly reduced by the extensive manufacture of an imitation and cheaper article in the United States, in recent years. Formerly the vanilla of Papantla, in the state of Veracruz, found ready sale at from \$15.00 to \$18.00 (Mexican money) per pound. Now it brings little more than half this amount. The total value of the Mexican vanilla crop of 1903, was only \$758,633, divided between five states, as follows: Puebla, \$428,833; Veracruz, \$128,400; Chiapas, \$600; Jalisco, \$550; Guerrero, \$250.

ANTONIO PERAZA.

Director of the General Bureau of Statistics.

9. Mexico — Mines and Mining. So intimately associated with the history of Mexico,—ancient and modern,—is the mining industry, that it would be impossible to exhaustively or intelligently consider either independently of the other. It cannot be doubted that centuries before the conquest of the country by Cortez, the native Indians had formed a more or less intelligent estimate of the value of the precious metals which, in a crude way, they extracted from the earth and fashioned into articles of personal adornment. This knowledge, though simple and superficial, had served, together with their natural cunning, to impress upon their untutored minds the importance of guarding from their conquerors the secret of the exact locations of the rich deposits they had discovered,—a secret which was only drawn from them through fear and cruelty. How thoroughly and profitably this information has been utilized from that time to the present in the acquisition of wealth is shown by the estimates of production of the precious metals, which have from time to time been made and published by various authorities of generally accepted reliability, a few of which are here given:

One of these gives the total production of the precious metals from 1537 to 1880, as \$3,881,380,000; another, for the same period, as \$4,653,-

MEXICO

OLEGARIO MOLINA,
SECRETARY OF FOMENTO, COLONIZATION AND INDUSTRY.

MEXICO -- MINES AND MINING

930,000; another, for the period from 1537 to 1884, as \$3,220,363,000; another, for the period from 1493 to 1895 (silver alone), as \$5,000,000,000; another, for the period from 1537 to 1880, as \$2,970,000,000; another estimates the entire output in 370 years as \$3,847,340,000.

From this confusing variety of estimates the reader must choose for himself; or, what is safer, ascertain the average and add at least 25 per cent to cover the probable deficiency caused by the incompleteness of totals, resulting from ignorance, carelessness, neglect, or design. In fact it is advisable to make a considerable addition to most statistical reports or estimates given out in this country, whether official or otherwise. The following figures, however, correctly represent the coinage of precious metals by the mints of Mexico from 1537 to 1896 inclusive,—a period covering 359 years:

Period.	Silver.
1537 to 1731.....	\$8,407,950
1732 to 1771.....	19,889,014
1772 to 1821.....	40,391,447
1822 to 1873.....	45,598,020
1873 to 1896.....	11,561,080
Totals,	\$125,937,511

The exports of gold and silver bullion from 1888-89 to 1902-03, inclusive, were as follows:

Fiscal Years.	Gold Bullion.	Silver Bullion.	Total Gold and Silver Bullion.
1888-89.....	\$349,506	\$6,649,260	\$6,978,766
1889-90.....	457,608	7,259,936	7,717,544
1890-91.....	612,618	6,731,217	7,363,835
1891-92.....	751,407	6,559,668	7,311,075
1892-93.....	357,887	5,148,202	5,506,089
1893-94.....	155,954	3,130,823	3,286,777
1894-95.....	4,139,645	18,803,867	22,943,512
1895-96.....	5,246,418	26,345,160	31,591,578
1896-97.....	5,858,366	32,137,257	37,995,623
1897-98.....	6,364,308	35,721,275	42,085,583
1898-99.....	7,347,760	40,429,054	47,776,814
1899-1900.....	7,225,615	52,116,384	59,341,999
1900-01.....	8,738,263	53,036,016	61,774,279
1901-02.....	9,141,294	49,021,133	57,162,427
1902-03.....	11,206,839	48,276,797	59,483,636
1903*.....	11,177,754	82,317,746	93,495,500
1904-05.....	13,696,146	65,523,645	79,219,791

The total silver product of the world from 1493 to 1895 is stated to have been \$10,345,688,700, of which about one-half was supplied by Mexico. Accepting the records of the past and the conditions and indications of the present in connection with this remarkable showing, there is certainly every reason to anticipate an indefinite continuance of this enormous production, if not a very considerable increase in the proportion to be credited to this country in the years to come. Nor is the increase confined to silver. Between the years 1897 and 1901 the exportation of gold, by Mexico, increased from \$3,922,300 in the former year, to \$8,595,353 in the latter; and of copper, from \$6,152,202 to \$10,177,752; the total product of gold, silver, copper, and lead in 1901 being \$97,000,000—the greatest in the history of the country to that time. From 1874-75 to 1894-95 inclusive, Mexico exported \$616,741,920 of silver and coined \$541,029,630. The exportation of silver ore did not begin until in the fiscal year 1886-87. Up to 31 Dec. 1888 there had been coined in the republic, \$122,751,291 gold; \$3,203,119,941 silver, and \$6,400,214 copper; or a total of \$3,332,-

271,447. This was exclusive of \$200,000 coined by Viceroy Mendoza, 31,667, by Señor Ayllon, and \$4,000,000 in nickels, coined during the presidency of General Gonzales.

The exports of minerals during the fiscal year 1904-05 were: Gold, \$13,696,145.45; silver, \$65,523,645.70; copper, \$20,803,420.63; lead, \$5,504,669.11; other minerals, \$1,110,361.39; total, \$115,638,243.28; a decrease of \$3,617,916.67 as compared with 1903-04. In the first eight months of 1905-06, the exports of minerals were: Gold, \$22,208,440.47; silver, 85,037,609.05; copper, \$20,258,902.23; lead, \$3,646,295.77; antimony, \$688,652.06; zinc, \$148,211.99; other mineral products, \$268,754.34; total \$107,246,049.46, or \$47,608,434.06 more than in the corresponding months of 1904-05.

In 1891 there were in the republic 11 mints, which were located respectively at	Gold.	Copper.	Totals.

Alamos, in the state of Sonora; Culiacan, in the state of Sinaloa; Chihuahua, Durango, Guajuato, Guadalajara, Hermosillo, Mexico City, Oaxaca, San Luis Potosi, and Zacatecas. Under the recently adopted monetary laws these have all been closed except the one in Mexico City, which will continue to be operated indefinitely. It is equipped with the most modern machinery and appliances. The government is now having a considerable portion of its new coins made at mints in the United States.

The historian Humboldt, than whom no man has ever better known Mexico, or more justly or correctly estimated its natural resources, declared that it was destined to become "the treasure house of the world." In the years that have followed his residence and investigations in the country, there have accumulated abundant proofs of the wisdom and soundness of his prophesy. He might reasonably have based his opinion upon the fact that a single lode in one of three districts which together added to the world's wealth \$252,000,000, or an average of more than \$1,000,000 per annum between the years 1556 and 1803. And this is only one of innumerable instances of the wonderful productiveness of the mines of Mexico. The district of Zacatecas contributed over \$810,000,000 toward the total production of the country between 1548 and 1900. The output of 989 mines in 1897 was \$53,755,695; of 1,138 mines, in 1898, it was \$65,129,840; and of 1,142 mines, in 1899, it was \$89,044,906, or a total of \$207,930,441 in the three years named. In the same period, the smelters and haciendas of the republic, which numbered 249 in 1897, had increased to 335 in 1898, and to 358 in 1899, treated ores to the value of \$216,207,952. In 1903 there was produced by 1,098 mines, \$94,870,301, and 519 smelters and haciendas treated \$115,602,860 worth of ore.

The leading states in the production of minerals in 1903 were: Hidalgo, \$19,190,341; Sonora, \$13,468,358; Durango, \$13,247,775; Chihuahua, \$9,401,251; Coahuila, \$6,961,551; Zacatecas, \$6,252,196. The leading states in the value of ore smelted or treated were: Nuevo

* The reason why the figures relating to silver bullion for the fiscal year 1904-05 appear so low, is that owing to the monetary reform, a sum of \$16,000,000 remained in the country for coinage purposes.

Leon, \$22,998,803; Aguascalientes, \$20,135,005; Sonora, \$13,329,214; Durango, \$11,898,014; Jalisco, \$7,218,176; territory of Lower California, \$7,107,403; Hidalgo, \$6,546,775; Coahuila, \$5,679,422. The total product in 1903 was chiefly divided between the different metals and combinations of metals, as follows.

Gold and silver in combination.....	\$41,218,867
Gold, silver, and lead in combination.....	8,681,977
Gold, silver, and copper in combination...	1,824,181
Gold, silver, lead and iron in combination	1,012,000
Gold.....	1,544,939
Silver.....	12,360,672
Silver and lead in combination.....	3,117,305
Silver, lead, and iron in combination.....	2,022,370
Silver and copper in combination.....	1,377,417
Silver, copper, and lead in combination....	1,010,327

The principal gold producing states in 1903 were, in the order here named: Chihuahua, \$640,000; Sonora, \$209,470; Zacatecas, \$182,000; Sinaloa, \$136,139; Durango, \$112,410. The principal silver-producing states were: Hidalgo, \$4,056,181; Durango, \$1,791,434; Zacatecas, \$1,708,234; Chihuahua, \$1,640,000; Sonora, \$1,418,982; San Luis Potosi, \$1,160,592. The principal copper-producing states were: Sonora, \$6,804,596; Puebla, \$2,157,655; territory of Lower California, \$1,130,828; Zacatecas, \$1,084,876. The leading iron-producing states were: Durango, \$513,000; Jalisco, \$74,625; Nuevo Leon, \$43,892. Gold and silver in combination: Hidalgo, \$15,031,652; Mexico, \$5,438,853; Chihuahua, \$5,046,121; Sonora, \$4,003,939; Guanajuato, \$2,844,845; Durango, \$2,638,845; territory of Tepic, \$1,309,508; Zacatecas, \$1,195,243. Gold, silver, and copper, in combination: Durango, \$1,059,543; Coahuila, \$296,542; Chiapas, \$178,895; Sonora, \$145,000. Gold, silver, and lead, in combination: Durango, \$7,045,153; Zacatecas, \$1,351,953; Chihuahua, \$256,866. Gold, silver, copper, and iron, in combination: San Luis Potosi, \$1,000,000; Durango, \$12,000. Silver and lead, in combination: Coahuila, \$1,402,077; Chihuahua, \$772,370; Durango, \$311,498; Michoacan, \$146,798; San Luis Potosi, \$145,382. Silver, lead, and iron, in combination: Nuevo Leon, \$1,200,440; Coahuila, \$505,250; Chihuahua, \$159,288. Silver, copper, and lead, in combination: Coahuila, \$930,677. Silver and copper, in combination: Sonora, \$810,400; Coahuila, \$191,658; San Luis Potosi, \$162,500; Durango, \$109,592. Lead and iron, in combination: Nuevo Leon, \$416,000. Coal, and coke: Coahuila, \$3,472,407; Veracruz, \$45,384. In 1904-05 large quantities of zinc were produced by the states of Nuevo Leon, Coahuila, and Chihuahua. This industry promises to become one of the most important in the republic.

Mexico's production of gold, silver, and copper alone, for the year 1904, is given as \$117,147,351, placing the country first in silver, second in copper, and fifth in gold among all the countries of the world.

The mining of gold has been neglected because of the greater ease and more satisfactory results attending the development of the more extensive and widely distributed deposits of silver. In recent years, however, the interest in gold mining has been somewhat increased, especially in the state of Guerrero, by the greater efficiency of modern methods and mechanical appliances.

When the question of cheap fuel in this country has been satisfactorily solved, the min-

ing of iron, which has been almost entirely neglected, will undoubtedly receive its full share of attention. It is estimated that there is enough of this metal in the republic, deposited beneath and near the surface, to supply the needs of the world. In the state of Durango, there is a hill or mountain 4,800 feet long and 640 feet high, which is composed of 70 per cent. pure iron, and is said to contain 300,000,000 tons of solid ore, without going below the surface of the surrounding plain. The depth of this deposit can only be guessed. The iron is highly magnetic in character. If further development of the coal deposits existing in Coahuila, and believed to exist in Puebla, Oaxaca, Sonora, Michoacan, Veracruz, Guerrero, Jalisco, Tlaxcala, Hidalgo, Tamaulipas, and Nuevo Leon, should confirm the value now claimed for them, both as to quantity and quality, there is reason to anticipate great activity in the near future, in the practical utilization of the enormous deposits of iron in this country.

According to the records of the Mexican department of Fomento, for 1903, there were in operation in that year 1,098 mines of various kinds, as follows: 359 gold and silver in combination; 174 silver; 111 silver and lead in combination; 79 copper; 58 gold; 54 gold, silver, and copper in combination; 50 silver, lead, and iron in combination; 42 gold, silver, and lead in combination; 36 silver and copper in combination; 15 iron; 13 silver, copper, and lead in combination; 13 gold, copper, and iron in combination; 12 lead; 11 silver, lead, and zinc in combination; 10 coal; 7 mercury; 7 gold, silver, lead, and zinc in combination; 6 gold, silver, copper, and lead in combination; 6 lead and iron in combination; 5 iron, zinc, and sulphur in combination; 5 gold, silver, copper, lead, and iron in combination; 5 copper and iron in combination; 3 gold, silver, and iron in combination; 3 silver and iron in combination; 2 gold and iron in combination; 2 gold, silver, lead, and iron in combination; 1 antimony; 1 antimony and iron in combination; 1 copper and lead in combination; 1 copper, lead, and iron in combination; 1 gold, copper, and lead in combination; 1 tin; 1 silver, copper, lead, and iron in combination; 1 silver, iron, and manganese in combination; 1 talc. In the working of these 1,098 mines there were employed 86,815 operatives, of whom 81,017 were men, 856 were women, and 4,942 were boys.

Of the 519 smelters and haciendas which, in 1903, smelted or treated the \$115,602,860 worth of ores, 127 employed the smelting process; 116, the patio process; 93, the amalgamation; 56, the lixiviation; 45, the concentration; 37, the plate; 25, the cyanization; 7, the smelting and roasting; 5, the matte; 4, the leaching; and 4, the chlorination. The distribution of metals, which together made up the above total, gave to silver, \$67,288,562; copper, \$24,285,907; gold, \$13,323,154; metal concentrates, \$468,4172; lead, \$3,693,193; tailing concentrates, \$551,116; iron, \$297,252; mercury, \$263,504; antimony, \$216,000.

The metalliferous belt of Mexico extends from the state of Sonora in the extreme north-western corner of the republic, in a southeasterly direction to and including the state of Oaxaca, the southern boundary of which is practically the Gulf of Tehuantepec. This great

MEXICO—MANUFACTURES

belt is 1,600 miles long and 250 miles wide and includes the states of Sonora, Chihuahua, Sinaloa, Durango, Zacatecas, Aguascalientes, Jalisco, San Luis Potosi, Guanajuato, Queretaro, Hidalgo, Mexico, Michoacan, Guerrero, Morelos, Puebla, and Veracruz. There are deposits in Coahuila, Nuevo Leon, and Tamaulipas; but these states are not considered as coming within the boundaries of the mineral belt proper. It is estimated that the state of Zacatecas has alone produced in three centuries over a thousand million dollars; and in the state of Queretaro, a single mine,—the "El Doctor," is said to have paid to the Spanish government \$18,000,000 in taxes, in two hundred years. Queretaro is known as the opal state, because of its position as the greatest producer of opals in the republic. Among other precious stones found in various parts of the country in considerable quantities, are the topaz, ruby, emerald, garnet, cornelian, agate, sapphire, jasper, turquoise, and amethyst.

The British Minister to Mexico in 1827, writing of the mining industry of the country in that year, stated that in Guanajuato, 14,000 mules were in daily use in mining operations, and that the corn on which they subsisted sometimes cost from \$2 to \$2.50 per 150 pounds.

The Pachuca mining district, in the state of Hidalgo, is one of the richest in the republic. Its mines have annually produced immense quantities of silver and gold for three centuries, and are still producing at the rate of from two to three million dollars every month. Authentic records, which have been kept for thirty years past, show this production to have reached the enormous sum of one billion dollars in that period, and is now producing more than one-third, in value, of Mexico's mineral output.

Mexican miners receive from fifty cents to \$1.50 a day and are able to work every day in the year without discomfort. Although somewhat slow to adopt modern methods and implements, they are, as a class, faithful and efficient operatives.

The mining laws of Mexico are considered as more nearly meeting the requirements of the mining industry in all its phases, than do those of any other country. Until 1884 they were wholly Spanish in their origin. In that year the present code was adopted. It gives mines in fee simple to discoverers who take the prescribed means for obtaining title to them. There is no forfeiture except in case of failure to pay the annual tax, which has been recently reduced to six dollars per mining claim of 2.47 acres, where twenty-five or more claims are contiguous and belong to one person or company. Only \$2 per claim is charged for all over twenty-five. Formerly the tax was \$10 in all cases, and this amount is still charged except under above conditions. This reduction has effected a saving to the mine owners of Mexico of over \$4,000,000 annually. The rights of owners are amply protected and are absolutely secure. If a person discovers a mine on land owned by another person, he can only claim the mineral and enough of the surface to enable him to work the mine, and must properly compensate the owner of the land. However old or valuable a mine may be, it is subject to relocation in case its owner fails to comply with the laws. Any inhabitant of the country

may make explorations for minerals. There is a prescribed form for making locations (denunciations), which must be properly filled out, signed, and submitted to the nearest "mining agent" of the district; or if there is no agent, then to the local postmaster. The expense of this formality is only one dollar. After the property has been examined and reported on by an expert selected by the "mining agent" or postmaster, four months are allowed other possible claimants to appear and present proofs of their claims. The experts receive an average of \$15 and traveling expenses for each claim examined and reported on, and are allowed 60 days in which to report. Notification of location or denunciation must be published in the official journal of the district. The cost of this is from \$2 to \$4; the entire expense of completing title seldom exceeding from \$10 to \$12 per claim. All titles must be registered in the district in which the properties are located. For this there is no fee.

The government of Mexico is most liberal and considerate in its relations to the mining industry and to the men whose capital and energies are employed in its development. To this fact must largely be credited the confidence that has induced an investment to the present time of not less than \$500,000,000 in the mines and smelters of the republic.

JOHN R. SOUTHWORTH, F. R. G. S.

Author of 'The Mines of Mexico,' published by authority of the Minister of Fomento, Mines and Agriculture.

10. Mexico—Manufactures. That Mexico is rapidly advancing as a manufacturing country and will soon take high rank in this respect, among the other great nations of the American continent, as she has already done in many others, is no longer open to question. Her creditable exhibits at the great industrial expositions of recent years have amply justified this prophecy. That these reflected great credit upon her artisans, her tillers of the soil, and her workers in all departments of industry, is nobly proven by the fact that their excellence was recognized on these internationally important occasions by official awards as follows:

City.	Year.	No. of Exhibits.	No. of Awards.
Paris	1889	3,026	953
Chicago	1893	1,658	1,177
Paris	1900	2,143	1,088
Buffalo	1901	859	611
St. Louis	1904	2,286	1,490

The significance of this showing is rendered even more creditable to Mexico as a rapidly developing country by the further fact that these 5,519 awards represent a little more than 46 per cent of the 11,969 exhibits made. A more convincing illustration of the wonderful growth of Mexico's substantial industries in recent years, or of her prospects for the future, than is supplied by her achievements at these five great international expositions could hardly be required, even by the most pessimistic student of industrial progress.

In considering the possibilities and prospects of manufacturing in Mexico, an encouraging circumstance is the disfavor with which the government looks upon everything savoring of the modern idea of quadrupling legitimate

MEXICO — MANUFACTURERS

profits through the brutal power of organized monopolies or trusts. Here honest and properly directed effort, in whatever channel of investment or industry, can feel sure of justice and protection against all evil-disposed influences, whether in the form of individual or combined effort. The most serious obstacle in the pathway of the manufacturer on a large scale is the question of labor. But even this is gradually righting itself. Immigration from over-populated countries, the introduction and use of modern machinery, the spread of intelligence among the common people, a better understanding between employer and employed, the advancement of the masses toward higher ideals, and the civilizing influence of contact with the prevailing spirit of progress, all tend toward better conditions in this regard. It should be remembered that only a few years ago,—less than twenty,—about all the manufacturing in Mexico was conducted in the most antiquated and primitive way, without the aid of mechanical training, technical knowledge, or modern machinery or appliances. The only exception to this rule, so far as the writer is able to recall, was the manufacture of cotton, which was carried on at least a quarter of a century ago, at Queretaro, Orizaba, Puebla and a few other points with the aid of the best equipment and in accordance with the best methods then known and obtainable, notwithstanding that the machinery used had to be transported from the port of Veracruz to distant interior points over rough mountain roads, on the backs of donkeys and peons. Now the industry is the most important in the manufacturing line in the republic, and is growing more so with every passing year,—due rather to the introduction of foreign capital and the building of railways than to the increase of cotton growing, which has by no means kept pace with the increased demand. A single company, whose mills are located at Orizaba, in the state of Veracruz, has a capitalization of \$15,000,000, employs 5,000 operatives and pays more than \$1,000,000 annually, in dividends. The mills are owned by French capitalists and managed by an Englishman; the looms are manned by Mexican operatives, the designers are recruited from seven countries and it operates more machinery on a single floor and in a single room than does any other cotton mill in the world. There has never occurred a strike among the operatives, or other evidence of discontent, and I have the testimony of the manager that those in the mills of Manchester, in England, are not more expert or faithful in their work.

According to the latest reports obtainable the average daily wages paid cotton factory operatives average from \$1.50 to \$5.00 for foremen, \$0.50 to \$2.00 for spinners, \$0.50 to \$1.25 for carders, \$0.50 to \$1.25 for washers, \$0.40 to \$1.25 for weavers, \$0.50 to \$2.25 for dyers, \$1.50 to \$3.00 for machinists, \$0.75 to \$1.25 for firemen, and \$0.40 to \$1.00 for hands. As shown by the Department of Fomento there were in the entire republic 118 cotton mills in 1900, of which 9 were in the state of Coahuila, 3 in Colima, 1 in Chiapas, 3 in Chihuahua, 9 in Durango, 4 in Guanajuato, 2 in Guerrero, 2 in Hidalgo, 5 in Jalisco, 6 in Mexico, 5 in Michoacan, 4 in Nuevo Leon, 3 in Oaxaca, 20 in

Puebla, 4 in Queretaro, 1 in San Luis Potosi, 3 in Sinaloa, 1 in Sonora, 7 in Tlaxcala, 9 in Veracruz, 13 in the Federal District, and 4 in the territory of Tepic. In the year named 58,459,913 pounds of raw cotton were used in these mills, producing 10,241,799 pieces of stamped and unstamped goods and 4,160,173 pounds of yarn. The operatives employed numbered \$21,960. In 1904, the last year reported, the number of mills in operation was 119, employing 27,706 operatives, using 63,582,313 pounds of raw cotton and producing 12,406,528 pieces of stamped and unstamped goods valued at \$42,510,910. Number of operatives employed, 27,706. Of the 641,060 spindles 120,192 were old style and 520,868 were modern, and of the 20,506 looms 4,213 were old style and 16,293 were modern. The leading consumers of raw cotton were the states Puebla, 15,092,222 pounds; Veracruz, 13,105,925; the Federal District, 5,006,927; Coahuila, 4,357,288; Mexico, 3,733,455; Tlaxcala, 3,608,758; Guanajuato, 3,382,851; Jalisco, 2,950,978; Durango, 2,085,150; Queretaro, 1,613,261; Nuevo Leon, 1,546,336; Michoacan, 1,385,593; Oaxaca, 1,254,869; Chihuahua, 1,145,124. No other state reached 1,000,000 pounds. The total value of the 1904 product of these cotton mills was \$42,510,901.65, of which \$10,276,335.71 is credited to the state of Veracruz, \$9,897,973.51 to Puebla, \$5,714,503.45 to the Federal District, \$2,351,958.96 to Coahuila, \$2,331,631.93 to Tlaxcala, \$1,638,958.67 to Jalisco, \$1,593,646.40 to Mexico, \$1,591,675.63 to Guanajuato, \$1,505,965.58 to Queretaro, and \$1,061,549.88 to Nuevo Leon.

In 1904 there were in the republic 466 manufactures of cigarettes and cigars, the product of which amounted to 17,963,096 pounds or 482,776,915 packages of cigarettes; 135,820,739 cigars, weighing 1,714,389 pounds; 1,931 pounds or 8,375 packages of snuff; 141,802 pounds or 312,948 packages of fine cut chewing tobacco, and 29,055 packages or 10,796 pounds of plug tobacco. Of the total production of cigarettes the Federal District is credited with considerably more than two-thirds, or 210,156,645 packages of cigarettes and 49,751,025 cigars. The leading states in the manufacture of cigarettes, in the order of numbers made, are, Sinaloa, Michoacan, Guanajuato, Puebla, Oaxaca, and Veracruz. In cigars Veracruz leads the states with 33,313,056 and is followed by San Luis Potosi with 13,431,609; Aguascalientes, 9,671,205; Puebla, 8,074,184, and Michoacan, 5,698,886. This industry is one of the most extensive and profitable in the republic, and the product is constantly advancing in quality as well as in quantity.

A comparatively new and rapidly developing industry in Mexico is the manufacture of iron and steel products, extending along the line from railway rails and heavy structural materials to the smallest bolt or nut. At Monterey, in the state of Nuevo Leon, a single company, established in 1900, and having a capital of \$10,000,000, is turning out 60,000 tons of manufactured product annually and will at once increase its capacity to 120,000 tons. It is unable to supply the demand for its products. There are also iron works in the states of Jalisco and Hidalgo, but these are not nearly as extensive as is the Monterey plant. Small foundries exist in all parts of the republic. Under the existing

MEXICO — COMMERCE

policy of protection, which Mexico has copied from the United States, this industry is enjoying prosperity and promises rapid and uninterrupted growth. Among the several other lines of manufacture which have only recently begun to manifest signs of active and aggressive life, are household furniture, men's clothing, boots and shoes, paints, varnish, soap, wheat flour, and paper. Others are being constantly added to the list. Of the more important lines in the industrial history of the country are: sugar, aguardiente, tequila, pulque and other alcoholic liquors, hats, rebozos, serapes, pottery, drawnwork, and candles. Of sugar almost 140,000 tons were made in 1905. The manufacture of aguardiente in 1904 amounted, in value, to \$11,836,126; of sugar, \$16,974,547; of molasses, \$5,303,032; of syrup, \$3,335,317; of pulque, \$11,125,032.

ELISHA HOLLINGSWORTH TALBOT,
Author of 'Commercial and Industrial Mexico.'

II. Mexico — Commerce. From 1874 to 1904,—a very brief period as time is computed in the making of a nation's history,—the exports of merchandise by Mexico to the United States increased from \$4,346,334 to \$43,633,275, and the imports from the United States increased from \$5,946,839 to \$45,844,720. In the fiscal year 1905-06 the imports from all countries amounted to \$220,651,074. Of this sum \$16,386,828.71 consisted of animal substances; \$32,616,928.93 of vegetable substances; \$90,937,430.56 of mineral substances; \$23,022,528.30, of dry goods; \$7,744,272.98 of chemical and pharmaceutical products; \$7,246,351.07 of spirituous liquors and other beverages; \$5,417,192.11 of paper and its applications; \$20,539,212.70 of machinery and its parts; \$4,620,031.53 of vehicles; \$4,122,237.03 of arms and explosives, and \$7,998,060.57 of miscellaneous articles. Increase over the previous year, \$42,446,112.04. In the same year the exports totaled \$271,138,809.32, the principal articles being: gold in various forms, \$31,695,777.38; silver in various forms, \$125,400,083.77; copper, \$28,655,897.35; vegetable products, \$62,928,135.51; animal products, \$11,723,435.23; manufactured products, \$2,978,441.02; miscellaneous, \$799,621.57. Increase over the previous year, \$62,618,357.89. Of the total importations, \$145,600,313.49 were from the United States; \$20,814,557.09 from Germany; \$20,344,643.81 from Great Britain; \$16,383,255.95 from France, and \$7,595,531.31 from Spain, the remainder being divided among the other countries in amounts ranging from \$1,000 to \$2,500,000. In the same period the exportations totaled \$271,138,809.32, as follows: gold in various forms, \$31,695,777.38; silver in various forms, \$125,400,083.77; copper, \$28,655,897.35; lead, \$4,967,806.23; other minerals \$1,980,621.26, coffee, \$9,288,623.32; henequen, \$29,437,318.50; hides, uncured, \$7,282,867.25; vanilla \$4,157,394.99; textile, \$3,667,844.88; beans, \$3,791,212.97; cattle, \$3,271,837.50; leaf tobacco, \$2,216,282.06; chewing gum, \$1,696,523.33, fresh fruits, \$295,334.20; zacaton root, \$1,872,757.00; woods, \$1,881,961.68; sugar, \$674,235.00, panama hats, \$556,748.29; miscellaneous, \$6,739,060.79. Of the total exportations, \$166,010,052.43 were to the United States; \$41,672,873.19, to Great

Britain; \$20,523,156.33 to Germany; \$8,012,279.73, to France; \$7,266,821.73 to Belgium; \$2,201,295.00 to Spain, and \$528,377.80 to Guatemala; no other country receiving \$500,000. In the previous fiscal year the importations were \$178,204,962.45, and the exportations, \$130,303,978.09. Only as far back as the fiscal year of 1894-95, the imports amounted to but \$66,200,000 and the exports to \$95,000,000, a remarkable record of material progress in the brief period of 11 years.

With the increase of commercial transactions there necessarily comes a corresponding increase of public revenues and expenditures, which, in Mexico, has been phenomenal, amounting in the ten years ending with 1904, to \$5,755,207.30 in revenues and \$5,897,157.19 in expenditures of the states, and to \$50,302,761.20 in the revenues, and \$31,215,547.13 in the expenditures of the Federal Government. The increase of revenues and expenditures of the municipalities of the country have also been considerable, amounting in the same period to \$2,343,755.48 in revenues, and \$2,346,354.47 in expenditures. It is both instructive and interesting to note the almost uninterrupted increase of imports and exports in the past 12 years, as shown in the following table:

Year.	Exports.	Imports.
1894-95.....	\$95,000,000	\$66,200,000
1895-96.....	112,000,000	78,700,000
1896-97.....	117,000,000	83,200,000
1897-98.....	128,000,000	97,200,000
1898-99.....	128,000,000	107,600,000
1899-1900.....	128,200,000	128,700,000
1900-01.....	128,000,000	133,000,000
1901-02.....	171,000,000	131,200,000
1902-03.....	207,300,000	191,300,000
1903-04.....	216,300,000	177,800,000
1904-05.....	220,520,431	178,204,962
1905-06.....	271,138,809	220,651,074

Further evidence of the wonderful commercial growth and importance of Mexico in recent years may be found in the statistics of the business done through her ports of entry. In 1904, the total number of steam vessels entering these ports was 4,744, having an aggregate carrying capacity of 4,984,437 tons, and the number of sailing vessels was 2,796, with a total carrying capacity of 367,131 tons. The actual amount of cargo discharged was 4,559,101 tons by both steam and sailing vessels. In the same year, 4,737 steam and 2,807 sailing vessels departed from the ports of the country, carrying a total cargo of 3,466,568 tons. From 1889 to 1904 inclusive there was an increase of 2,324 in the number of vessels, both steam and sailing, which entered these ports. Of the entries in 1904, there were 5,946 from the ports of the republic, 822 from the United States, 351 from England, 122 from Cuba, 94 from Germany, 57 from Guatemala, 30 from France, 20 from Brazil, and 15 from Spain, while of the total sailings, 5,892 were to the ports of the republic, 916 to the United States, 305 to England, 208 to Cuba, 67 to Germany, 54 to Guatemala, 20 to Spain, 15 to France, 15 to Italy, and 12 to Australia. Of the total entries, there were through the port of Alvarado 43, Campeche, 764, Coatzacoalcas, 282, Chetumal, 131, Frontera, 297, Isla del Carmen, 372, Progreso, 740; Tampico, 528; Tuxpan, 110; Veracruz, 774; all Gulf of Mexico ports. The entries through Pacific ports were: Acapulco,

MEXICO — COMMERCE

201; Altata, 235; Ensenada, 141; Guaymas, 539; La Paz, 441; Manzanillo, 183; Mazatlan, 571; Puerto Angel, 40; Salina Cruz, 86; San Benito, 46; San Blas, 237; San Jose del Cabo, 116; Santa Rosalia, 446; Tonalá, 51; Topolobampo, 170. In order to show the relative importance of the Mexican custom houses, both maritime and frontier, the following statement of collections of import duties for the month of August, 1906, is given: Veracruz, \$1,410,326.28; Tampico, \$597,474.93; Laredo, \$448,267.55; Juarez, \$313,004.99; Progreso, \$310,400.06; Mexico City, \$240,635.90; Ciudad Porfirio Diaz, \$179,423.00; Nogales, \$66,730.03; Mazatlan, \$64,259.58; La Morita, \$60,006.61; Frontera, \$28,821.65; Agua Prieta, \$23,146.39; Coatzacoalcas, \$16,956.02; Campeche, \$15,639.17; Soconusco, \$15,512.55; Guaymas, \$11,445.79; Acapulco, \$8,194.25; Manzanillo, \$6,434.17; Matamoros, \$6,034.62; Santa Rosalia, \$5,544.25; Isla del Carmen, \$5,124.42; Ensenada, \$4,903.37; Mexicali, \$4,661.66; Altata, \$3,860.19; Chetumal, \$3,332.89; La Paz, \$3,269.05; Tuxpan, \$2,434.43; San Blas, \$2,071.44; Salina Cruz, \$1,979.09; Tijuana, \$1,043.62; Topolobampo, \$1,031.25; Guerrero, \$517.64; Tonalá, \$500.57; Las Vacas, \$412.60; La Ascension, \$317.74; Camargo, \$108.61; Zapaluta, \$59.43; Mier, \$51.37; Puerto Angel, \$26.94. In the upbuilding of the foreign commerce of Mexico, the construction of railways made possible the phenomenal results that have been achieved in the last 25 years. The entire foreign trade of the country, practically, has been created since 1875, most of it since 1880. Before competition in the transportation of freight was provided, the rate from Veracruz to Mexico City, 264 miles, ranged around \$68.00 per ton, going as high as \$330.00 during the French intervention. For several years past, the rates on all lines of railway have been such as to encourage and protect industrial development in every part of the republic. Next in importance, in the great work of placing this wonderful country where it justly belongs in the list of nations, have been the hundreds of millions of American dollars, and the army of enterprising American financiers, miners, manufacturers, agriculturalists and merchants that have crossed the Rio Grande, cast their lot among these kindly people and pinned their faith on the stability of this government and the sound business policy of the men who control its destinies.

Among the very important matters in connection with the exporting of merchandise to Mexico, and in regard to which all exporters should fully inform themselves, and by which they should be strictly governed in making shipments, are the Mexican customs regulations. These are strictly enforced, and are not unreasonable in their requirements, which are that duplicate copies of bills of lading covering the goods to be exported shall be sent to the custom house broker at the port of import, together with a copy of the invoice and manifest, and a packing list, and that the original bill of lading and invoice shall be sent direct to the consignee, that the packing list shall show the marks, counter-marks and number of packages, and contents of each, and the principal material of which each article is made, and if plated, must state with what it is plated, gross weight and

the kind of goods in each package, the legal weight of each package, name of consignee, destination, and the name of the custom house broker in whose care the freight is consigned. The valuation must in all cases represent the actual value of the merchandise at the point of shipment. If articles are undervalued they are subject to a fine, although the value may cut no figure in the duties, all of which are specific. This rule applies also to declarations regarding weight and class of merchandise, which must be given correctly, otherwise a fine will be imposed. Weights and measures are expressed according to the metric system, and should be so plainly written that no mistake can be made in reading them. In addition to the weights, the number of gallons should also be given in exporting wines or brandies. The length and width of each piece of cloth fabric must be given, including fringes. Declarations as to weight and class of merchandise must be exact. If undervalued or underweighed a fine will be imposed. Duties on animals are based on the head, and all animals except hogs and geldings are admitted free. On all other classes of merchandise the duties are based on weights and measures, except on brandies, wines and whiskies, which pay on the gallon, and on boots and shoes, which pay on the pair.

From 1876 to 1905 the imports by Mexico, according to the United States Department of Commerce and Labor, increased four fold and the exports seven fold. Formerly almost all the furniture imported by Mexico came from France, but now it is supplied by the United States. Most of the importations of agricultural machinery and implements are from the United States. The same is true of food stuffs, lumber, machinery for irrigation works, supplies for mining and for steam and electric railways, unmanufactured leather, vehicles, boots and shoes, canned goods, patent medicines, live stock, cotton, manufactures of steel and iron, sewing machines and typewriters. From Spain and France come most of the wines, and the whisky is supplied by the United States and Scotland. Germany has long had a monopoly of the hardware trade, England of the dry goods trade, and France of the trade in notions, jewelry and fancy goods. Among the leading articles exported by Mexico are coffee, two thirds of which goes to the United States and the balance to England, Germany and France, vanilla, sugar, tropical fruits, beans, live stock, precious metals, henequen, leaf tobacco, hides, rubber and ixtle.

Mexico has a "commercial code" which was "decreed" by the President in 1887, and which, among other things, provides that foreigners shall be free to engage in commerce, subject to the same conditions and requirements that apply to citizens; that all documents referring to matters of public concern shall be recorded in a public register, that all business correspondence shall be preserved; that notice by circular or through the press shall be given of the character of any business about to be established and of any modifications or other changes subsequently made; that at least three account books,—a general day book, a book of inventories and balances and a ledger,—shall be kept in the Spanish language; that all brokers

MEXICO — TRANSPORTATION

must be Mexicans by birth or naturalization, have a mercantile education and possess a diploma from the Minister of Fomento or other proper officer; that an unlawful agreement or contract involves no cause of action at law; that mercantile companies may consist either of a partnership under a collective name or with special partners, or may be an anonymous (stock) company, a society with special partners or a co-operative society; that all contracts for the formation of companies must be in writing and very full and explicit; that the consolidation of companies cannot take effect until two months after publication of particulars, except on payment of all debts; that foreign companies must register in Mexico and publish an annual balance sheet; that there may be "temporary" or "profit-sharing" mercantile associations, the first being without a firm name and making partners jointly liable to third persons, and the last named implying an association under which two or more persons may become interested in operations which one or more may undertake in their own names, but which involve only one legal entity and no responsibility on the part of a partner not joining in a contract with a third party; that the principal of any manufacturing or commercial business shall be responsible for the acts of his managers or employees; that no institution of credit can be established except by authorization of the Minister of Finance and the approval of Congress; that every merchant ceasing to make his payments, whose liabilities are more than 25 per cent. in excess of his assets, who has made formal assignment of his goods, or who has absented himself without leaving any person in charge of his business who can pay his debts as they become due, shall be considered a bankrupt.

ANTONIO LEON-GRAJEDA,
Vice-Consul of Mexico, New York.

19. **Mexico — Transportation.** Until as late as 1873 but little real progress had been made in providing suitable means of transportation in Mexico. Nineteen years previously the first railway—a three mile line from Mexico City to Guadalupe—had been completed, and also one from Veracruz to Tejeria, 12 miles. Both these are now a part of the Mexican line. In 1861, the Tejeria road was extended to Paso del Macho, 35 miles further inland from Veracruz, the work being done by the French army as a military necessity. Here the English company which still owns and operates the completed road from Mexico City to Veracruz, took over the enterprise and pushed its extension from Guadalupe to Apizaco. Then followed the exceedingly difficult and expensive task of building the mountain division between Esperanza and Paso del Macho, at that time regarded as one of the most difficult feats of engineering that had ever been attempted. In 1873 the entire line was completed, and Veracruz was at last connected with the capital of the nation by a band of iron—a long and sadly needed commercial and industrial convenience. Until then there had been no practical effort toward even the building of decent wagon roads, and the problem of transportation had proven to be the most difficult in connection with the prelim-

inary work of development then just being inaugurated. How well the government stood by this initial railway of the great system which now consists of over 10,500 miles of track, is seen in the fact that for 28 years it extended practical support and assistance in the shape of an annual cash subsidy of \$560,000—a grand total of \$15,680,000 in the period named—a royal gift, indeed, and one that has been repaid many fold in resultant benefits. It was the first step in the march of enlightened progress that has now become a resistless onrush, with no sign of abatement.

From the day when Porfirio Diaz entered upon his wonderful career as President of Mexico, the question of transportation has been one of the most seriously considered and liberally treated of the many that have had to be met. Until then the burro, the mule and the peon had supplied all needs, not even being obliged to divide honors with canal boat or "prairie schooner," and these primitive means had been generally considered quite equal to the necessities then existing. To successfully inaugurate a policy of railway building and commercial and industrial development, this Moses had not only to spend lavishly of the country's very limited treasure, in the way of cash subsidies, but to overcome the habits and prejudices of centuries, and to actually create a sentiment favorable to the new policy. "He builded better than he knew," for he has already lived to see the fruition of his most sanguine hopes, in the construction of a network of railways extending from the great gulf, at Veracruz, to Tuxpan, to beautiful Patcuaro lake, and to the coffee groves of Uruapan, in the far southwest: from the United States border at El Paso, Eagle Pass and Laredo to Salina Cruz, on the Gulf of Tehuantepec; from Matamoros, where the Rio Grande empties into the Gulf of Mexico, and from the rapidly growing port of Tampico to San Marco, almost in sight of the Pacific Ocean: from Nogales, on the Arizona border, due south to Guaymas, on the Gulf of California, and between many interior points in various parts of the republic, already aggregating almost 11,000 miles of modern built track, with other thousands under construction or projected with every prospect of early completion. Following the building of the Mexican railway, connecting the capital with the country's most important port, Veracruz, the Central line was pushed rapidly southward from the United States border at El Paso, Texas, touching in its 1225 mile course the important cities of Chihuahua, Zacatecas, Aguascalientes, Leon, Guanajuato and Queretaro. Work on this great enterprise was begun in 1881 and finished in 1884, an accomplishment which commanded the unstinted admiration of the Mexican people, who had not before witnessed so remarkable an exhibition of energy. The National line, which had been commenced in 1880, was not finished until 1885, unavoidable and unanticipated obstacles having interfered to cause delay.

Starting the list of Mexican railways and their several branches, with the Central system, and following with the others in the order of their mileage, we have the following very creditable showing:

MEXICO — TRANSPORTATION

MEXICAN CENTRAL SYSTEM.		Miles.	PAN AMERICAN.		Miles.
El Paso, Texas, to Mexico City, main line.....	1,244		San Geronimo to Pijijapan	163	
Aguascalientes to Tampico and La Berra.....	425

Practically, all communities in the republic having a sufficient population to justify the building of tramways or street railways are provided with them, and as a rule these properties have proven to be profitable to their owners and satisfactory to the public. In the National Capital and leading from that city to outlying towns, the service is excellent in every respect.

In considering the reciprocal benefits of the government's policy of encouragement, in its relations to the railway lines of the country, completed and projected, at least a fair offset for the subsidies that have been given or may be given, is presumed to exist in the provision which obliges all subsidized lines to carry the mails free and to deduct from 40 to 50 per cent. from regular freight and passenger rates, on government business. What, with the present completed mileage, the extensions and new lines under construction and the numerous projects which are expected to materialize in due course, it is not unreasonable to anticipate that by 1910 a grand system of not less than 15,000 miles of railway will be in profitable operation in Mexico; penetrating the mountain fastnesses and rich plains and valleys that have not yet heard the sound of the locomotive, and adding untold millions to the sum total of the country's wealth.

According to Federal statistics, the total earnings of the steam railways of the country in 1904 were: passenger, \$23,236,679.92; freight, \$57,531,515.78; total earnings 1904, \$80,768,195.70.

Water Transportation.—The development of the means of transportation of Mexican commerce by water has been very marked in the last few years, several new lines of steamers and many new vessels having been added to the already important fleet. From the various Mexican ports the following steamer lines provide regular sailings:

Ward.—Veracruz to Progreso, Havana, New York, etc.

There are steamer lines on the Grijalva, Usumacinta, Coatzacoalcos, Papaloapan, Palizada, Chilapa, Tulija, Yaqui, Guaymas and other rivers of the republic.

The Federal Government recently secured practical, if not absolute control of the National railway system, and indications point to a growing sentiment in official circles favorable to the idea involved in this very important transaction. It is even asserted in well informed quarters that in due time one or more of the other great lines may follow the lead of the National.

The building of the Tehuantepec railway from Coatzacoalcos, on the Atlantic coast, to Salina Cruz on the Pacific, across the narrowest part of the republic, a distance of only 189 miles, has effected a saving of 870 miles over the Nicaragua route, and of 1,429 miles over the Panama route between New York and San Francisco.

Of the \$700,000,000 (gold) invested in Mexican enterprises by Americans, it is estimated that over \$450,000,000 found lodgment in the railways of the republic.

ELISHA HOLLINGSWORTH TALBOT,
Author of Commercial and Industrial Mexico.

13. Mexico — Finance. The first banking establishment in Mexico,—a department of the old Monte de Piedad (National Pawnshop),—dates back to the year 1776. Circulating notes were issued by it in commercial transactions, for more than 100 years and then withdrawn, the government having in 1881 granted the exclusive privilege of issuing notes, to the National Bank. The first bank organized to do business in accordance with modern methods was the Bank of London and Mexico, which was established in the City of Mexico in 1864 and is now the second financial institution in the republic in importance. Its capital which was originally \$500,000

MEXICO—FINANCE

is now \$21,500,000 and its reserve is \$10,750,000. In addition to these two banks there are now 26 others in the republic which issue notes, as follows:

NAME OF BANK.	LOCATION.	CAPITAL.
Mineral Bank	Chihuahua	\$5,000,000
Yucateco Bank	Merida	12,000,000
Mercantile Bank	Merida	6,000,000
Bank of Durango	Durango	2,000,000
Bank of Zacatecas	Zacatecas	1,000,400
Bank of Nuevo Leon	Monterrey	2,000,000
Bank of the State of Mexico	Toluca	3,000,000
Bank of Coahuila	Saltillo	1,600,000
Bank of San Luis Potosi	San Luis Potosi	1,100,000
Bank of Sonora	Hermosillo	1,300,000
Occidental Bank	Mazatlan	1,500,000
Mercantile Bank	Veracruz	3,000,000
Bank of Jalisco	Guadalajara	6,000,000
Mercantile Bank	Monterrey	2,500,000
Oriental Bank	Puebla	6,000,000
Bank of Guanajuato	Guanajuato	3,000,000
Bank of Tabasco	San Juan Bautista	1,000,000
Bank of Chiapas	Tuxtla Gutierrez	500,000
Bank of Hidalgo	Pachuca	1,000,000
Bank of Tamaulipas	Ciudad Victoria	1,000,000
Bank of Michoacan	Morelia	600,000
Bank of Aguascalientes	Aguascalientes	600,000
Bank of Oaxaca	Oaxaca	1,000,000
Bank of Morelos	Cuernavaca	1,000,000
Bank of Queretaro	Queretaro	1,000,000
Bank of Campeche	Campeche	1,000,000
Bank of Guerrero	Iguala	500,000

There are two banks of hypothecation,—the "International and Hipotecario," capital \$5,000,000, the "Agricola and Hipotecario," capital \$2,000,000, both of Mexico City, and two banks of "promotion,"—the Central, of Mexico City, capital \$10,500,000, and the Commercial, of Chihuahua, capital \$200,000. The aggregate capitalization of the 33 banks of issue, on 31 Aug. 1906, was \$148,100,000; amount of notes in circulation \$93,370,448; bonds in circulation, \$17,725,200; reserve fund \$53,904,908.21. On the date named these banks had on hand, in gold, \$42,144,705.87; in silver, \$28,385,769.86; in notes of other banks, \$4,766,605.00; their loans on securities were \$99,495,753.34; loans on mortgages, \$22,039,481.50; money on call, \$23,081,953.14; debtor account, \$232,989,885.95; value of buildings, \$6,230,687.70; notes in circulation, \$93,370,448; bonds in circulation, \$17,725,200; sight deposits, \$38,340,543.49; term deposits, \$27,226,546.20; credit account, \$270,184,170.65; reserve, \$53,904,908.21. The total business for the month was \$618,851,816.55. In July it reached \$623,813,434.17.

There has been a remarkable increase in bank transactions in the last few years, necessitating the addition of \$99,600,000 since 1898, and \$42,250,000 since 1902, to the capital employed in banking in the republic. From 31 Aug. 1903, to 31 Aug. 1906, sight deposits increased from \$7,857,083.10 to \$38,340,543.47; term deposits from \$5,984,994.19 to \$27,226,546.20; reserve from \$19,887,457.81 to \$53,904,908.21 and value of buildings from \$3,437,858.69 to \$6,230,687.70. The profits realized and distributed on account of the business of these banks for the year ending 31 May, 1906, were \$19,251,994.19. These figures do not include the banks which have not the privilege of issuing notes.

The National Bank maintains branches in the cities of Chihuahua, Durango, Guadalajara, Guanajuato, Mazatlan, Merida. San Juan Bau-

tista, Monterey, Oaxaca, Puebla, San Luis Potosi, Veracruz, Zacatecas, and Tampico; and the Bank of London and Mexico is similarly represented in Veracruz, Puebla, Quaretarro, Lerdo, Monterey, Guanajuato, Guadalajara, San Luis Potosi, Morelia, and Mazatlan. The Central Bank, of Mexico City, is practically a clearing house for the country banks throughout the republic, all of which own more or less of its stock and are its correspondents in the cities where located. The total banking capital of the republic, including banks of issue and all others which make their capitalization public, is \$161,800,000 Mexican money. If to this amount be added the capital of the half dozen or more institutions which do not make this feature of their business public, or which are branches of foreign banks, as in the cases of the bank of Montreal and the International Banking Corporation, the grand total becomes considerably larger.

The following list represents the banking institutions which, not having organized under government concession do not issue circulating notes but which enjoy all other privileges granted to banks of issue:

NAME OF BANK.	LOCATION.	CAPITAL.
United States Banking Co.	Mexico City ..	\$2,000,000
Mexico City Banking Co.	Mexico City ..	500,000
Mercantile Banking Co.	Mexico City ..	500,000
Industrial & Commercial Bank	Mexico City ..	10,000,000
United States & Mexican Trust Co.	Mexico City ..	Capital not given.
Bank of Montreal (Branch)	Mexico City ..	Capital not given.
International Banking Corporation (Branch)	Mexico City ..	Capital not given.
American Bank	Mexico City ..	Capital not given.
El Oro Trust Co.	El Oro	100,000
Veracruz Banking Co.	Veracruz	100,000
Saltillo Banking Co.	Saltillo	200,000
American Bank	Torreón	100,000
Guadalajara Banking Co.	Guadalajara ..	Capital not given.
Orizaba Banking Co.	Orizaba	Capital not given.
Cananea Banking Co.	Cananea	Capital not given.

It is greatly to the credit of the banking system of Mexico that no bank operating under a government concession has ever failed. And the same is true of banks without concession, which have restricted their business to legitimate banking transactions. The high estimate in which the shares of Mexican banks are held at home is shown by the following table of prices quoted in Mexico City, 19 Oct. 1906, for nine favorite issues:

NAME OF BANK.	FACE VALUE OF SHARES.	PRICE BID.
National Bank, Mexico City	\$100	\$378
Mercantile Bank, Merida	100	270
Bank of London & Mexico, Mexico City	100	253
Bank of Sonora, Hermosillo	100	230
Bank of Nuevo Leon, Monterrey ..	100	198
Bank of San Luis, Potosi	100	190
Yucateco Bank, Merida	100	187
Central Bank, Mexico City	100	178
Mercantile Bank, Veracruz	100	174
International & Hipotecario Bank, Mexico City	100	173

Banking in Mexico ceased to be a monopoly on the adoption of the law relating to "institutions of credit," 19 March 1907. Up to that time only two banks of issue had been allowed.

—the National Bank of Mexico, and the Bank of London and Mexico. Now there are 33 which issue ordinary bills or notes, and two which issue cash bonds that are a first lien on their assets. Three of the 33,—the National Bank, the Bank of London and Mexico, and the Central Bank, all of Mexico City, have a combined capital of \$74,500,000.

From 1808, when Spanish rule ended, to 1867 inclusive, the total revenues of the country were a little less than \$816,000,000, and in the same period the expenses were \$791,000,000. But it was not until 1896 that the government of Mexico experienced the peace of mind and real joy resulting from the knowledge that there reposed in the national vaults a respectable surplus over and above immediate necessities. In that year the country, for the first time in its history, and after a most trying and embarrassing struggle with the financial problem, which had continued through 30 years of hard earned peace, attained the solid footing the foundation of which is credit. In that year the credit side of the great ledger showed a surplus of \$6,000,000. In that year interstate duties were abolished. In that year the era of progress was inaugurated which has had no check and which promises an uninterrupted future of substantial prosperity.

It was in 1823 that Mexico contracted her first debt, borrowing in London \$10,000,000 sterling, with which to purchase war ships and war materials, afterwards in 1851, refunding this debt by issuing new bonds, the interest on which could not, however, be paid when due, on account of disturbed conditions, revolutions and internal troubles of various kinds. Finally, in 1888, a re-adjustment of the debt was arranged by issuing new gold bonds bearing 6 per cent., since which all has gone smoothly, and there has been neither default of interest nor other failure to keep obligations.

Under the terms of the "monetary reform" law which became operative 1 May 1905, Mexican coins consist of \$10 and \$5 gold pieces, \$1.00, \$0.50, \$0.20 and \$0.10 silver coins, \$0.05 nickel coins and \$0.02 and \$0.01 bronze coins. Banks of issue and mortgage banks are required to have at least \$500,000 capital, and agricultural, mining and industrial banks must have at least \$200,000 capital. No bank can be organized until its capital is fully subscribed and until at least half is paid up. Ten per cent. of net profits must be set aside for a reserve, until such reserve equals one third or more of the capital stock. The duration of the concession under which a bank is organized cannot exceed 30 years for banks of issue, and 50 years for other banks. The total issue of notes must not exceed three times the paid up capital nor, together with deposits payable on demand or subject to withdrawal on not more than three days' notice, exceed twice the holdings of the bank in cash,—gold or silver bullion. Bank notes are not legal tender. Only notes of the denominations of \$5, \$10, \$20, \$50, \$100, \$500 and \$1,000 can be issued. Banks are forbidden to loan or to discount notes for more than six months, to discount paper not guaranteed by at least responsible signatures, unless collateral security is given, to pledge their own notes or create any other lien on them, to mortgage their property or to pledge notes

which they have discounted. Mortgage banks may make loans at simple interest, payable on fixed dates, principal to be refundable within short periods. "Banks of Promotion" may make loans for not more than two years, to mining, manufacturing, and agricultural enterprises; may guarantee paper for not more than six months, issue interest bearing treasury bonds for from three months to two years, etc. In case of a mine loan the bank must have a representative at the mine to receive the proceeds and protect the lender. In no case can these banks issue bonds exceeding their holdings in cash, bullion and realizable securities. They cannot issue bank notes, loan on real estate, issue mortgage bonds or operate in mines, metallurgical works, factories, or farms, or enter into partnership with persons in either of these lines. No bank can deal in its own shares or use them as security, nor can two or more banks consolidate without the consent of the Federal Government. An inspector is appointed by the government for each bank, who must report as to payments on account of subscriptions to its capital, examine and approve monthly cash payments, see that all statements required by the Finance Department are properly and promptly made, require proof of cash holdings and value of securities, sign all notes or securities and see that they do not exceed the amount permitted by law, certify to the cancellation and destruction of such notes or securities, keep an account of notes or securities put in circulation, be present at auctions or drawings and generally see that the law is complied with. He is forbidden to meddle with the management, to furnish information to anyone, to hold shares in, ask loans from or become in any way a debtor to the bank to which he is assigned. All banks are required to publish monthly balances showing uncalled for capital, cash holdings, amount of notes discounted, amount of collateral and mortgage loans, amount of holdings of public funds and shares or bonds immediately realizable, balance of accounts current, value of real estate holdings and of notes and other securities in circulation, amount of capital, etc. The Department of Finance publishes an annual statement showing the condition of all banks of issue. Any bank not operating under governmental authority or concession must use the words "sin concesion," (without concession), after its name.

ELISHA HOLLINGSWORTH TALBOT,
Author of 'Commercial and Industrial Mexico.'

24. Mexico—Army and Navy. No necessity for a large standing army or an extensive navy has existed in Mexico since the dawn of the era of peace inaugurated by President Diaz a little more than a quarter of a century ago. Rather has the attention of the government been directed toward the development of the country's commercial and industrial possibilities. Still, there has been no neglect of wise precautions against possible trouble from without or from within. A well organized War and Navy Department has been maintained, its chief executive being a member of the President's official family, and every effort that technical skill and learning, ripe experience and patriotic pride could suggest has

MEXICO—ARMY AND NAVY

been devoted to the uplifting of the rank and file, to perfecting the esprit du corps in all departments and among all grades, to providing the most modern types of arms of every kind, to the education of suitable young men for service as officers, and generally to the good of the service in all of its many ramifications. To the writer, who has witnessed many evidences of the advance made through the past 24 years, in all these regards, its extent appears almost incredible.

Through the courtesy of a prominent official of the War and Navy Department the following statistics representing the condition of both branches of the service in October 1906 have been obtained.

The Army.—As at present organized the Army consists of: Generals of Division, 9; Generals of Brigade, 51; Brigadier Generals, 45; Jefes or Chiefs, of various grades, 697; Commissioned Officers, 2,238; Infantry, 14,697; Cavalry, 6,003; Artillery, 1,666; One Battalion of Zapadores (sappers) 568; Medical corps, 327; Construction duty, 317; Military college, (Chapultepec), 277; Military school (Tlalpam), 133; President's guard, 98; Engineers, 73; On various detail duties, 169; total number private soldiers in the army, 24,328; total number marines in navy, 1,039; horses, 5,739; mules, 2,583.

The republic is divided into 10 military zones, number one including the states of Sonora, Sinaloa and the Territory of Lower California; number two, the states of Chihuahua and Durango; number three, the states of Nuevo Leon, Tamaulipas and Coahuila; number four, Jalisco; number five, San Luis Potosi and Aguascalientes; number six, Guanajuato and Michoacan; number seven, Puebla and Guerrero; numbers eight and nine, Oaxaca; number ten, Campeche, Tabasco and the Territory of Quintana Roo. There are 28 battalions of infantry, and several parts of battalions and companies, the latter for service in the Territories of Quintana Roo and Lower California; one battalion of zapadores (sappers); a President's guard, and numerous gendarmes; 14 regiments of cavalry, and four parts of regiments, and two auxiliary corps, the latter for service in the states of Puebla and Sonora, and one squadron for service with the Geographical Exploration Commission; two regiments of mountain artillery, one regiment of horse artillery, a squadron of rapid fire cannon, etc.

The government maintains military hospitals in the cities of Guadalajara, Chihuahua, Torin, Puebla, San Luis Potosi, Santa Cruz de Bravo, Tepic, Veracruz, Monterey, and the National Capital and infirmaries in Ulua, Acapulco and Matamoros.

The National Military College, the buildings of which adjoin the castle of Chapultepec—the summer residence of the President near Mexico City—is one of the best equipped and most practical establishments of the kind on the American continent. It long ago took very high rank as a military school. The attendance of students during the fiscal year 1905-06 was 277. At the International Exposition held in Saint Louis, in 1904, a detail from this college was awarded the highest prize for proficiency—a gold medal. A school for military aspirants

has recently been established at Tlalpam, a suburb of Mexico City, which is under the control of the Minister of War and Marine. The faculty is composed of carefully selected officers of the army and includes two chiefs and 14 minor officers representing the infantry, cavalry, artillery and engineering branches, and all of whom are graduates of the National Military College, of Chapultepec. The government also maintains an academy for the commissioned officers of the army, in which is given advanced theoretical and practical instruction in the topography and geography of the country, and in regard to fortifications, ordnance, military jurisprudence, etc., and schools in the various camps, in which the common soldiers are taught reading, writing, arithmetic, geometry, geography and the history of the country. To stimulate the love of study in the minds of the soldiers, money prizes ranging from \$5 to \$50 are given for proficiency in the various branches taught. In 1903 there were 46 of these schools, 10,015 students and 315 premiums and 37 honorable mentions were awarded, the premiums amounting to \$2,615. In 1904 the number of cash premiums was 380, amounting to \$3,700, and the honorable mentions numbered 153. In 1905 there were 13,052 students, 48 professors and 59 assistants, the salaries paid the latter amounting to \$41,160. In the opinion of the Minister of War and Marine this educational experiment has proven to be successful in a phenomenal degree. Instruction in appropriate branches of learning is regularly given on two school ships, the "Zaragoza" and "Yucatan," and includes the advantages of an annual cruise to Mexican and United States ports. The government has recently appropriated \$187,000 to the building of military barracks in the city of Guadalajara; \$77,000 to the improvement of the barracks at San Luis Potosi; \$271,000 for the improvement of the offices of the War and Navy Department; \$206,000 for an armory; \$109,000 for cavalry barracks near the city of Morelia, and a number of smaller sums for less important improvements. As rapidly as circumstances permit, the most modern arms of every description are being substituted for old patterns, and all departments of the service are being modernized so as to conform to the general advance in the science of war.

The Navy.—The Mexican Navy consists of two corvettes, the *Zaragoza* and *Yucatan*; the gunboats *Veracruz*, *Bravo* and *Morelos*, and the transport *Progreso*, for service on the Gulf of Mexico; and the gunboats *Democrata* and *Tompico* and transport *Oaxaca* for service on the Pacific Ocean. The *Zaragoza* is 213 feet in length, has a displacement of 1,226 tons and a speed of 13 knots, is built of steel, and its armament consists of six Canat guns, two Nordenfeldt rapid fire guns and two Hotchkiss revolving guns, the *Yucatan* is 279 feet in length and built of iron; the *Veracruz* is 200 feet in length, 1,000 tons displacement, has a speed of 16 miles and is built of steel. It has two Bethlehem rapid fire guns, 6 semi-automatic rapid fire guns and one Whitehead torpedo gun, the *Bravo* and *Morelos* are each 252 feet in length, have 2,500 horse power and a speed of 16 miles; they are built of steel, and each carries two Bethlehem

MEXICO

MANUEL GONZALES COSIO,
SECRETARY OF WAR.

MEXICO — THE STATES OF

rapid fire guns and six Schneider-Canat rapid fire guns; the *Progreso* is 230 feet in length, has 1,585 tons displacement, a speed of 12 miles, is built of steel and will carry 250 tons of cargo and 600 men, with the usual complement of officers, the *Democrata* is 138 feet in length, 450 tons displacement, 600 horse power and has a speed of ten miles, the *Tampico* is of the same dimensions, speed, armament, etc., as the Veracruz; the *Oaxaca* is 100 feet in length, its tonnage is 979, its speed 7 knots, and it was built of steel, and will carry 300 tons of cargo, 200 cattle and 500 men. Reserves are provided for service in the army in case of war, which can, if needed, be made to swell the entire fighting force to almost 500,000 men. Probably one of the most notable military organizations in the world is the mounted force known as the "Rurales," which is distributed throughout the republic, and numbers some 150 officers and 1,200 men. It is not under the control of the War Department but of the Department of the Interior. Its members provide their own subsistence and receive much higher pay than do the regular soldiers. They wear leather uniforms, broad brimmed sombreros, ride magnificent horses, which they personally own, and are distinguished for their sturdy bravery and intelligent loyalty. They serve a somewhat similar purpose to that of the Mounted Police of the Northwest Territory of Canada.

ELISHA HOLLINGSWORTH TALBOT,
Author of *Commercial and Industrial Mexico*.

15. Mexico — The Mexican States. A very brief description of each of the several States and Territories of Mexico, in the order of alphabetical precedence, is here given, covering only the more notable and valuable facts in which the reader is naturally most interested:

AGUASCALIENTES.

One of the smaller States of the Republic (only Colima, Morelos and Tlaxcala are smaller), but one of the most prosperous and best equipped as to natural advantages, educational facilities, and other inducements to permanent residence. It is situated in the central "mesa," between 21 degrees, 30 minutes and 22 degrees, 23 minutes north latitude, and 20 degrees, 40 minutes and 30 degrees, 48 minutes longitude west of the Mexican meridian. On the north, east and west, it is bounded by the State of Zacatecas, and on the south by Jalisco. It has a superficial area of 2,975 square miles. The revenues for the fiscal year 1904-05 were \$191,870.98; expenses, \$187,678.81. The revenues of the municipalities were \$169,960.88; expenses, \$175,276.77. Value of country property, \$3,610,961.77; of city and village property, \$3,549,490.50. Principal products: Chili peppers, \$232,873; frijoles, \$102,000; corn, \$704,600; wheat, \$80,136; peaches, \$3,735; quinces, \$5,562; minerals, \$366,363. Value of metals smelted within the State, \$22,348,119. Total value of fruits produced, \$29,391, and of vegetables, \$8,721. Meats consumed, \$835,423. The principal cities are: Aguascalientes (the capital), (q.v.) Rincon de Romos and Tepezala. The State is divided into four departments or political divisions. Pop., 102,416.

CAMPECHE.

Situated in the southeast corner of the Republic, between 10 degrees, 49 minutes and 20 degrees, 5 minutes north latitude, and 6 degrees 38 minutes and 9 degrees, 48 minutes east longitude, meridian of Mexico. Bounded on the north by Yucatan and the Gulf of Mexico, on the east by the Territory of Quintana Roo, on the west by the Gulf of Mexico, and on the south by the Republic of Guatemala and the State of Tabasco. Area, 18,026 square miles. Principal cities: Campeche (the capital) (q.v.), Laguna and Ciudad del Carmen. Principal products in 1904: Aguardiente, \$985,490; rice, \$7,000; sugar, \$319,852; chili peppers, \$4,000; sugar cane, \$69,924; chewing gum, \$263,500; frijoles, \$7,100; henequen, \$943,187; corn, \$1,768,420; molasses and syrup, \$75,561; woods, \$2,246,247; fruits, \$94,986; vegetables, \$30,657. The revenue for 1904 amounted to \$82,239.34; expenses, \$81,234.78. Value of country property, \$9,427,800; of city and village property, \$8,362,875. The State is divided into five departments. Pop., 86,542.

CHIAPAS.

Nearest State to the Meridian, being between 14 degrees, 31 minutes and 17 degrees, 57 minutes north latitude, and 4 degrees, 46 minutes and 8 degrees longitude west of the meridian of Mexico. Bounded on the north by the State of Tabasco, on the east by Tabasco and the Republic of Guatemala, on the south by the Pacific ocean and the Republic of Guatemala, and on the west by the States of Oaxaca, Veracruz and Tabasco. Area, 27,222 square miles. Principal towns: Tuxtla Gutierrez (the capital) (q.v.), San Cristobal, Comitán, Tapachula, Tonalá and Soconusco. Value of country property (1904), \$23,695,500; of city and village property, \$3,460,456. Revenues of State in same year, \$607,036.86; expenditures, \$705,645.76. Principal products: aguardiente, \$316,896; cotton, \$4,065; indigo, \$22,207; rice, \$14,354; sugar, \$73,915; cacao, \$47,310; coffee, \$1,074,597; sugar cane, \$307,185; chili peppers, \$12,357; frijoles, \$294,826; henequen, \$50,955; corn, \$759,687; molasses, \$254,626; pulque, \$20,460; wheat, \$47,937; tobacco, \$10,657; woods, \$174,321; fruits, \$82,122; vegetables, \$63,796. The State is divided into 12 departments. Pop., 360,799.

CHIHUAHUA.

The largest of the States, its superficial area being 73,191 square miles. Its northern boundary is the southern boundary of the United States; eastern, the State of Coahuila; southern, the State of Durango; and western, the States of Sinaloa and Sonora. It is divided into 10 districts and is situated between 26 degrees, 20 minutes and 31 degrees, 45 minutes north latitude and 8 degrees, 30 minutes longitude west of the Mexican meridian. Principal cities and towns: Chihuahua (the capital) (q.v.), Parral, Ciudad Juarez, Jimenez, Ciudad Guerrero, Camargo, Santa Rosalia and Bustamante. Is one of the most conspicuous States in mining, stock raising, manufacturing, and in the matter of railway facilities. Its country property was valued (1904) at \$7,180,994.97; its city and town property at \$9,502,-

MEXICO — THE STATES OF

to \$2,572,140. This State is particularly favored in the way of a market for most of its products, because of the fact that it almost surrounds the Federal District, in which is situated the Federal Capital. Pop., 934,463.

MICHOACAN.

Situated between 18 degrees, 6 minutes north latitude and 0 degree, 53 minutes, and 4 degrees, 30 minutes west longitude, meridian of Mexico. Bounded on the north by the States of Jalisco, Guanajuato and Queretaro, on the east by the State of Mexico, on the west by Colima and Jalisco and the Pacific ocean, and on the south by Guerrero and the Pacific ocean. Area 22,695 square miles. Principal cities and towns: Morelia (the capital) (q.v.), Patzcuaro, Uruapan, Zamora, Tacambaro, Maravatio, La Piedad, and Zitacuaro. Value of country property in 1904, \$26,626,033; of city and town property, \$10,131,041. Revenues, \$1,418,068.57; expenditures, \$1,021,879.94. Principal products: aguardiente, \$242,018; benesede, \$80,170; cotton, \$73,119; indigo, \$28,000; rice, \$494,250; sugar, \$1,069,417; coffee, \$44,607; sweet potatoes, \$147,669; sugar cane, \$195,791; barley, \$230,053; chili peppers, \$160,743; frijoles, \$199,183; chickpeas, \$216,205; haba beans, \$29,700; corn, \$248,557; syrup, \$150,072; molasses, \$518,606; wheat, \$2,339,820; tobacco, \$63,719; woods, \$379,937; fruits, \$398,333 (the principal contributors to which were: watermelons, \$120,733; bananas, \$77,139; oranges, \$46,022; muskmelons, \$42,478; mangoes, \$21,440); vegetables, \$69,526; minerals, \$3,870,525. Value of ores treated by the smelters of the State, \$55,660. Consumption of meats, \$3,256,586. In this State is the lake of Patzcuaro, the most beautiful and picturesque body of water in the Republic. The most famous coffee produced on this continent is grown in and about the town of Uruapan. At the north end of the lake of Patzcuaro is the old town of Tzintzuntzan, where, in an equally old church is the most famous painting in the Republic. 'The Entombment,' by Titian, which is guarded as a treasure above price. The curious little town was once the capital of the Tarascan empire and had a population of at least 40,000, although now it has not more than 1,500. Pop., 935,268.

MORELOS.

Situated between 18 degrees, 20 minutes, 10 seconds and 19 degrees, 7 minutes and 30 seconds north latitude, and between 0 degree, 25 minutes, 31 seconds east longitude, and 0 degree, 16 minutes, 20 seconds west longitude, Mexican meridian. Bounded by the Federal District and State of Mexico on the north; Puebla on the east; Mexico on the west, and Guerrero on the south. Area, 2,759 square miles. The principal towns are: Cuernavaca (the capital) (q.v.), and Cuautla. The income of the State for 1901 was \$165,807.85; expenditure, \$136,561.03. Value of country property, \$7,357,995.12; of town property, \$2,126,306.73. The principal products were: aguardiente, \$726,931; rice, \$977,414; coffee, \$1,142,424; sugar, \$3,964,331; chili peppers, \$15,836; frijoles, \$50,207; yucca, \$452,815; corn, \$1,280,474; syrup, \$533,403; molasses, \$283,144; woods, \$822,910;

fruits, \$350,252; to which bananas contributed \$70,732, lemons \$50,700, oranges \$50,193, watermelons \$32,967, and muskmelons \$36,951. Vegetables produced a return of \$51,709. Meats consumed, \$1,284,873. Cuernavaca, the capital of the State, is one of the most noted health and pleasure resorts in the Republic, and the scenery between that city and the National Capital is unexcelled. Pop., 160,115.

NUOVO LEON.

Situated between 22 degrees, 40 minutes, and 27 degrees, 51 minutes north latitude, and 0 degree, 37 minutes, east longitude, and between 2 degrees, 9 minutes west longitude, meridian of Mexico. Bounded on the north by the States of Coahuila and Tamaulipas and by the United States; on the east by Tamaulipas; on the south by Tamaulipas, San Luis Potosi and Coahuila, and on the west by Coahuila and Durango. Area, 24,317 square miles. The capital is Monterrey (q.v.), and the other important towns are Linares, Lampazos and Teran. The income of the State in 1904 was \$373,899.26; expenditures, \$315,594.88. Value of country property, \$7,753,044.88; of city and town property, \$10,439,571.14. The principal products were: aguardiente, \$18,000; sugar cane, \$623,756; barley, \$38,765; chili peppers, \$20,798; frijoles, \$67,832; ixtle, \$441,300; corn, \$1,643,863; mezcal, \$133,079; molasses, \$1,040,905; wheat, \$30,226; woods, \$212,168; fruits, \$129,861, the principal ones being oranges, \$49,514; aguacates, \$16,667; watermelons, \$14,169; peaches, \$13,994, and figs \$8,729. Of vegetables the product was \$89,334; of minerals, \$1,985,537. The value of ores treated by the smelters of the State was \$19,866,658. Consumption of meat, \$1,634,716. The American element in this State is quite strong and very influential in the work of development. Pop., 327,937.

OAXACA.

Bounded on the north by the States of Puebla and Veracruz, on the east by Chiapas, on the west by Guerrero, and on the south by the Pacific ocean. Area, 35,382 square miles. Situation between 15 degrees, 16 minutes, 45 seconds and 18 degrees, 25 minutes, north latitude, and between 0 degree, 40 minutes, and 5 degrees, 11 minutes, 30 seconds east longitude, meridian of Mexico. Principal cities and towns: Oaxaca (the capital) (q.v.), Tehuantepec, Ocotlan, Salina Cruz, Tuxtepec, and Puerto Angel. The revenues in 1904 were \$1,063,518.03; expenditures, \$1,025,953.00. The value of country property was \$13,795,392.73; of city and town property, \$7,926,395.01. The principal products were: aguardiente, \$153,291; cotton, \$152,104; rice, \$31,566; chickpeas, \$66,120; sugar, \$279,660; coffee, \$509,676; sugar cane, \$656,951; chili peppers \$61,296; frijoles, \$264,355; figs, \$40,121; corn, \$1,413,319; mezcal, \$79,169; honey, \$169,353; molasses, \$120,142; pulque, \$36,741; wheat, \$192,562; tobacco, \$831,261; woods, \$328,815; fruits, \$312,867, of which oranges are credited with \$56,632; bananas, \$69,161; mangoes, \$29,434; watermelons, \$26,121, and cocoanuts, \$24,208. The production of vegetables amounted to \$42,052; of minerals, to \$526,968. The value of ores treated was

MEXICO—THE STATES OF

\$347,523. Consumption of meats, \$2,766,949. Pop., 948,633.

PUEBLA.

Surrounded by the States of Hidalgo, Veracruz, Oaxaca, Guerrero, Morelos, Mexico, and Tlaxcala. Area, 12,204 square miles. Contains 21 districts or political divisions. The capital, which bears the same name as the State, is the third city in population and commercial importance in the Republic. It is the centre of a very extensive cotton manufacturing district. The principal products in 1904 were: aguardiente, \$557,321; rice, \$100,000; chickpeas, \$70,798; coffee, \$297,864; sugar cane, \$1,209,979; barley, \$1,024,791; rye, \$80,400; chili peppers, \$240,250; frijoles, \$624,046; haba beans, \$212,286; corn, \$5,300,527; syrup, \$108,795; molasses, \$306,773; potatoes, \$318,570; pulque, \$477,846; wheat, \$2,532,768; fruits, \$455,331, to which sum bananas contributed \$58,111; oranges, \$52,128; cherries, \$34,292; apples, \$28,142; mamey, \$29,236, and aguacates, \$26,442. The production of vegetables amounted to \$212,835, to which sum tomatoes alone contributed \$142,178. The return of mineral products was \$2,085,335, and the value of ores treated by local smelters, \$3,307,349. Meats consumed, \$4,494,790. The revenues of the State in 1904 amounted to \$1,377,078.88; expenditures, \$1,369,071.41. Value of country property, \$25,549,886.59; of city and town property, \$37,100,873.20. Meats consumed, \$4,494,790. Value of cotton goods manufactured, \$9,897,973.51. There are 32 cotton mills in the State, 147,000 spindles, 4,807 looms and 5,200 operatives. The principal towns are: Puebla (the capital), (q.v.), San Andres, Tehuacan, Acatlan, San Marcos, Cholula, Atlilco and Zacatlan. Pop., 1,021,133.

QUERETARO.

The boundaries of this State are San Luis Potosi on the north, Hidalgo and Mexico on the east, Michoacan on the south, and Guanajuato on the west. Situated between 19 degrees, 26 minutes, and 21 degrees, 36 minutes north latitude, and between 0 degree, 1 minute and 1 degree, 29 minutes, 30 seconds west longitude, meridian of Mexico. Area, 3,557 square miles. Principal cities and towns: Queretaro (the capital) (q.v.) and San Juan del Rio. There are six departments or political divisions. In 1904 the total revenues of the State were: \$352,149.59; expenditures, \$359,053.81. Value of country property, \$11,180,035.72; of city and town property, \$4,121,474.50. Principal products: aguardiente, \$14,915; sugar cane, \$16,725; barley, \$56,204; chili peppers, \$35,871; frijoles, \$901,577; chickpeas, \$95,216; corn, \$2,350,258; pulque, \$67,128; wheat, \$1,117,522; woods, \$719,795; fruits, \$69,712, of which amount aguacates contributed \$35,907. The production of vegetables was \$18,013. Meats consumed, \$458,452. Value of cotton goods manufactured, \$2,505,965.58. It was at the capital city of this state that Maximilian and two of his leading generals were executed. Pop., 232,389.

SAN LUIS POTOSI.

The irregular shape of this very important State is such that its boundaries include part of

the lines of the nine States of Coahuila, Nuevo Leon, Tamaulipas, Veracruz, Hidalgo, Queretaro, Guanajuato, Jalisco and Zacatecas. It is divided into 13 districts, has an area of 25,316 square miles, and a population, (census 1900), of 575,432. Its principal cities and towns are: San Luis Potosi, (the capital) (q.v.), Catorce, Matehuala and Rio Verde. Revenues in 1904, \$1,005,049.87, and expenditures \$1,002,669.71, and the value of country property, \$17,492,794.22 and of city and town property, \$11,545,703.65. Principal products: aguardiente, \$210,593; peanuts, \$300,925; coffee, \$416,208; sugar cane, \$47,006; barley, \$69,092; chili peppers, \$144,041; frijoles, \$404,343; ixtle, \$444,869; corn, \$6,700,631; mezcal, \$207,736; molasses, \$534,414; pulque, \$86,130; wheat, \$76,343; tobacco, \$19,607; woods, \$309,121; fruits, \$237,332, chief among which were prickly pears, \$58,560; oranges, \$53,932; aguacates, \$21,505; mangoes, \$18,657; limes, \$11,652; apples, \$10,256 and bananas, \$10,673; the production of vegetables amounted to \$24,340, and of minerals to \$4,591,399. Value of ores treated by the smelters of the State, \$8,742,986. Consumption of meats, \$1,980,114. Value of cotton goods manufactured, \$122,464.62. Number of cigarettes manufactured, 17,552,674 and of cigars, 13,431,609. Pop., 575,432.

SINALOA.

Situated between 22 degrees, 33 minutes, and 28 degrees, north latitude and between 6 degrees, 19 minutes and 10 degrees, 35 minutes west longitude, Mexican meridian. Bounded on the north by the State of Sonora; on the east by Chihuahua and Durango; on the south by the territory of Tepic and on the west by the Gulf of California. Area, 33,671 square miles. Principal towns: Culiacan (the capital), Mazatlan, Fuerte and Rosario. There are 10 districts or political divisions. The revenues of the State in 1904 were \$559,969.54; the expenditures, \$556,988.94. Value of country property, \$7,489,707.32; of town property, \$6,399,681.57. Principal products: aguardiente, \$134,000; cotton, \$32,840; sugar cane, \$1,050,110; frijoles, \$140,076; chick-peas, \$52,320; ixtle, \$39,515; corn, \$1,009,356; mezcal, \$171,049; syrup, \$214,100; molasses, \$114,126; wheat, \$67,600; tobacco, \$35,276; woods, \$214,574; fruits, \$173,765, of which amount watermelons contributed \$40,720; bananas, \$29,639; mangoes, \$26,209; oranges, \$19,673 and muskmelons, \$18,760. Vegetables, \$95,451. Minerals, \$5,948,352. Value of ores treated by the smelters of the State, \$4,885,089. Consumption of meats, \$1,309,407. Value of cotton goods manufactured, \$68,578. This is one of the Pacific coast States now being rapidly developed through the investment of immense sums of money in railway building, mining and agriculture. Pop., 290,761.

SONORA.

The most northwesterly State of the Republic. Situated between 26 degrees, 20 minutes, and 32 degrees, 29 minutes, 44 seconds, north latitude, and 0 degree, 15 minutes, 55 seconds, longitude west of meridian of Mexico. Area, 76,900 square miles. Principal towns: Hermosillo (the capital) (q.v.), Guaymas, Cananea, Nogales, Naco, Alamos and Agua Prieta.

MEXICO—THE STATES OF

The State is bounded on the north by the United States; on the east by the State of Chihuahua; on the south by Sinaloa, and on the west by the Gulf of California and the Territory of Lower California. It is divided into nine districts. Revenues in 1904, \$768,043.26; expenditures, \$609,380.21. Principal products: cotton, \$24,600; chick-peas, \$268,128; sugar cane, \$47,935; barley, \$45,647; chili peppers, \$43,063; frijoles, \$324,912; corn, \$1,367,101; mezcal, \$148,400; molasses, \$56,014; potatoes, \$46,291; wheat, \$1,232,022; tobacco, \$55,290; woods, fruits and vegetables not reported; minerals, \$15,839,980 and value of ores treated by smelters of the State, \$9,516,058. The consumption of meats amounted to \$2,239,365. Value of cotton goods manufactured, \$353,356.40. Number of cigarettes manufactured, 2,929,440. The greatest mining State of the Republic, leading the next highest State (Chihuahua) by \$2,560,041. Pop., 221,682.

TABASCO.

Situated in the southeastern part of the Republic, between 16 degrees, 5 minutes, and 18 degrees, 39 minutes north latitude, and between 5 degrees 11 minutes, and 8 degrees, 10 minutes longitude, east of the meridian of Mexico. Bounded on the north by the Gulf of Mexico; on the east by the State of Campeche and the Republic of Guatemala; on the south by the State of Chiapas and the Republic of Guatemala, and on the west by the State of Veracruz. Area, 10,072 square miles. There are 17 municipalities in the State. The principal towns are: San Juan Bautista (the capital) (q.v.), Frontera and Tonala. Value of country property in 1904: \$8,184,368.89; of town property, \$5,334,594.44. Revenues, \$564,345.02; expenditures, \$501,265.01. Principal products: aguardiente, \$400,632; rice, \$165,355; sugar, \$100,900; cacao, \$1,137,991; coffee, \$71,410; sugar cane, \$77,160; chewing gum, \$34,562; frijoles, \$289,987; gum elastic, \$104,855; corn, \$720,800; syrup, \$36,206; molasses, \$16,824; tobacco, \$40,842; woods, \$242,512; fruits, \$40,778; vegetables, \$17,163; meats consumed, \$932,916. Pop., 159,834.

TAMAULIPAS.

One of the least developed of the Mexican States. Situated between 24 degrees, 14 minutes and 27 degrees, 38 minutes, 15 seconds north latitude, and between 2 degrees east longitude and 1 degree, 15 minutes west longitude, meridian of Mexico. Bounded on the north by the United States; on the east by the Gulf of Mexico; on the south by the States of Veracruz and San Luis Potosi, and on the west by Nuevo Leon. Area, 32,576 square miles. Principal towns: Victoria (the capital) (q.v.), Tampico, Matamoros, New Laredo and Ciudad Guerrero. Income in 1904 \$314,420.97; expenditures, \$301,240.27. Value of country property, \$9,361,860.25; of town property, \$8,722,965.57. Principal products: aguardiente, \$85,250; cotton, \$99,873; rice, \$18,742; sugar cane, \$76,646; barley, \$372,900; frijoles, \$212,358; corn, \$1,393,606; syrup, \$40,912; molasses, \$220,919; fruits, vegetables and woods not reported; minerals, \$268,505; meats consumed, \$731,898. Pop., 218,948.

TLAXCALA.

The smallest of the Mexican States, having an area of only 1,595 square miles. Lies between 19 degrees, 5 minutes, and 19 degrees, 43 minutes, north latitude, and from 0 degree, 28 minutes, 30 seconds, to 1 degree, 28 minutes, 15 seconds east longitude, meridian of Mexico. Bounded on the north by the States of Hidalgo and Puebla; on the east and south by Puebla and Mexico, and on the west by Puebla. The State is divided into six districts. Principal towns: Tlaxcala (the capital) (q.v.), Tlaxco and Alzayanca. In the year 1904 the revenues of the State were \$377,654.43; expenditures, \$334,279.03. Value of country property, \$8,113,497.94; of town property, \$881,703.33. Value of cotton goods manufactured, \$2,331,631.93. The little State is the center of very important manufacturing, dairy and agricultural interests generally. Neither agricultural, fruit, vegetable nor wood products were reported for 1904. In the town of Tlaxcala stands the first church from which a Christian sermon was preached on the American continent. The pulpit from which this sermon was preached is still carefully preserved. Pop. 172,315.

VERACRUZ.

Situated between 17 degrees, 10 minutes, 30 seconds and 22 degrees, 19 minutes, 25 seconds, north latitude, and between 0 degree, 28 minutes, and 5 degrees, 30 minutes, east longitude, meridian of Mexico. Bounded on the east by the Gulf of Mexico; on the north by Tamaulipas; on the west by Puebla, Hidalgo, Oaxaca and San Luis Potosi, and on the south by Chiapas and Oaxaca. Principal cities and towns: Veracruz, Orizaba, Xalapa (the capital) (q.v.), Cordova, Papantla, Coatepec, Coatzacoalcos, Minatitlan, San Andres Tuxtla, Tlacotalpan and Tuxpam. Value of country property in 1904, \$62,651,716.17; of city and town property, \$61,729,467.47. The State revenues were \$1,350,992.91; expenditures, \$1,168,297.85. The revenues of the municipalities were, \$2,385,700.65; expenditures, \$2,352,656.10. The principal products of the State in the same year were: Aguardiente, \$5,401,814; cotton, \$81,426; rice, \$398,127; chick-peas, \$49,683; sugar, \$6,469,359; coffee, \$10,492,682; sugar cane, \$6,366,077; barley, \$482,357; chili peppers, \$1,428,385; chewing gum, \$576,939; frijoles, \$1,960,897; haba beans, \$34,465; gum elastic, \$171,800; corn, \$14,728,187; honey, \$230,386; syrup, \$1,838,205; molasses, \$288,768; potatoes, \$97,771; pulque, \$68,688; wheat, \$338,964; tobacco, \$3,245,430; woods, \$1,499,809; fruits, \$1,875,730, to which enormous sum bananas contributed \$666,920; oranges, \$357,678; aguacates, \$130,536; mangoes, \$222,646; pineapples, \$104,777; watermelons, \$89,642; limes, \$49,893; prunes, \$24,855; peaches, \$24,091; and cocoanuts, \$23,814. Vegetables produced, \$203,415, of which sum pumpkins supplied \$72,423; cabbages, \$49,797, and tomatoes, \$22,864. Meats consumed, \$6,112,569. Value of cotton goods manufactured, \$10,276,335.71. Number of spindles, 108,697, and of looms, 4,244. Number of operatives in cotton mills, 5,390. There were manufactured in the same year 20,040,725 cigarettes and 33,313,056 cigars. There has recently been spent in improvements on the harbor alone

MEXICO — THE STATES OF

\$26,000,000. Area, 29,201 square miles. Pop., 981,030.

YUCATAN.

The most southeasterly and in respect to its ancient history, one of the most interesting States of the republic. Situated between 17 degrees, 40 minutes and 21 degrees, 35 minutes north latitude, and between 8 degrees, 39 minutes, and 12 degrees, 12 minutes east longitude, meridian of Mexico. Bounded on the north by the Gulf of Mexico; on the east by the Territory of Quintana Roo; on the south by the Territory of Quintana Roo and the State of Campeche, and on the west by the State of Campeche. Area, 35,204 square miles. Principal cities and towns: Merida (the capital) (q.v.), Progreso, Peto, Ticul, Uxmal and Izamal. The revenues of the State in 1904 were \$3,507,679.92; the expenditures, \$857,033.92. Value of country property, \$15,071,017.39; of city and town property, \$14,786,169.44. Principal products: aguardiente, \$223,000; henequen, \$30,982,487; corn, \$746,281; honey \$51,500; woods not reported; fruits, \$287,979, the principal ones being oranges, \$107,960; aguacates, \$29,700, watermelons, \$19,300; bananas, \$17,400; limes, \$15,408 and lemons, \$12,740. The value of vegetables produced was \$37,205. Consumption of meat, \$5,456,530. Pop., 309,652.

ZACATECAS.

One of the oldest and best known mining States of Mexico. Situated between 21 degrees, 9 minutes, and 24 degrees, 53 minutes, 50 seconds north latitude, and between 20 degrees, 7 minutes, 40 seconds and 5 degrees, 20 minutes, west longitude, meridian of Mexico. Area, 24,757 square miles. Bounded on the north by the State of Coahuila; on the east by San Luis Potosi, on the south by Aguascalientes and Jalisco, and on the west by Durango and the Territory of Tepic. Principal cities and towns: Zacatecas (the capital) (q.v.), Jerez, Sombrerete, Fresnillo, and Pinos. The revenues in 1904 were: \$790,048.12; expenditures, \$828,633.04; value of country property, \$18,060,181.30; of city and town property, \$9,578,900.97. Principal products, sugar cane, \$245,150; barley, \$91,783; chili peppers, \$73,147; frijoles, \$170,911; corn, \$2,462,578; molasses, \$244,285; wheat, \$256,742; woods, \$154,433; fruits, \$106,852; chief among which were apples, \$64,113; oranges, \$21,802; peaches, \$17,042; pears, \$16,808; raisins, \$11,686; prickly pears, \$11,119 and quinces, \$9,620. Vegetables gave a return of \$23,593. The total value of minerals produced was \$5,050,543 and value of ores treated, \$3,486,746. Meats consumed, \$1,021,794. Pop., 462,190.

TERRITORIES.

LOWER CALIFORNIA.

This is the largest of the Mexican territories, having an area of 58,328 square miles. It is bounded on the north by the United States; on the east by the State of Sonora and the Gulf of California, and on the south and west by the Pacific ocean. It lies between 22 degrees, 35 minutes, and 32 degrees, 42 minutes, north latitude, and between 10 degrees and 18 degrees, west longitude, meridian of Mexico.

The capital of the northern district is Ensenada and of the southern district, La Paz. The other leading chief towns are: Santa Rosalia and Mulgé. The income of the Territory in 1904, was \$103,017.81; expenditures, \$104,108.28; value of country property, \$3,916,800.69; of town property, \$1,407,922.72. Principal products: cotton, \$5,300; sugar cane, \$68,080; frijoles, \$17,040; corn, \$33,400; syrup, \$135,650; molasses, \$145,850; fruit, \$12,000; wine from grapes, \$16,600; woods, \$61,238; fruits, \$99,880, to which sum raisins contributed, \$47,550; figs, \$30,225 and watermelons, \$10,120. Vegetables produced, \$7,065 and minerals, \$1,835,628. The value of ores treated was \$570,761; of meats consumed, \$482,359. Pop., 47,624.

QUINTANA ROO.

This newest, least known and least developed of the three Mexican territories is situated in the southeast corner of the Republic. It is bounded on the north by the State of Yucatan and the Gulf of Mexico; on the east by the Sea of the Antilles; on the south by Belice and the Republic of Guatemala, and on the west by the states of Yucatan and Campeche. It may be considered a military possession, inasmuch as it seems to have been given territorial existence in order that the Federal Government might more effectively handle the unruly Indians of the region,—part of the State of Yucatan,—who were the last in the Republic to be brought under control. It is governed by the military, and a military railway, which was built by the army, and is 35 miles long, connects the towns of Vigia Chico and Santa Cruz de Bravo, the latter being the capital of the Territory. There appears to be no official record of the population or products of the Territory, nor of its dimensions. In fact it appears to be still included in the State of Yucatan in so far as these details are concerned.

TEPIC.

This territory formerly belonged to the State of Jalisco and was known as the "Ancient Seventh Canton." It is situated between 19 degrees, 45 minutes, and 22 degrees, 45 minutes, north latitude, and between 4 degrees, 47 minutes and 6 degrees, 40 minutes, west longitude, meridian of Mexico. Area, 11,275 square miles. Bounded on the north by the States of Sinaloa and Durango; on the east and south, by Jalisco, and on the west by the Pacific Ocean. Principal towns: Tepic (the capital), Ixtlan, Sayula, San Blas and Acaponeta. There are 16 departments or political divisions. Principal products: aguardiente, \$101,603; cotton, \$43,293; rice, \$144,045; sugar, \$252,570; coffee, \$235,202; sugar cane, \$77,108; chili peppers, \$31,072; frijoles, \$222,114; corn, \$990,050; molasses, \$68,043; tobacco, \$332,830; woods, \$509,356; fruits, \$128,991, the principal ones being bananas, \$48,563; apples, \$22,463; oranges, \$20,952, and watermelons, \$11,456. Vegetables, \$46,272. The production of minerals reached the large sum of \$5,943,328 and the value of ores treated, \$1,460,560. Meats consumed, \$604,080. Value of cotton goods manufactured, \$378,306.73. Number of cigarettes manufactured, 5,545,670; of cigars, 3,821,591. Pop., 150,098.

MEXICO — THE STATES OF

FEDERAL DISTRICT.

This area of only 461 square miles includes within its boundaries the national capital and a large number of near by villages and towns, and has a population of not less than 650,000. In 1904 the real estate of the District,—country, city and village,—was valued by the National Government at \$252,716,454.29. Its actual value at the present time may be reasonably placed at not less than \$400,000,000; some authorities estimate it above \$500,000,000. The northern, eastern and western boundaries are supplied by the State of Mexico, and the southern boundary by the State of Morelos. Geographically, the Federal District is situated between 19 degrees, 26 minutes, 12 seconds north latitude, and 99 degrees, 6 minutes, 42 seconds, east longitude. Meridian of Greenwich; 101 degrees, 27 minutes, 18 seconds east longitude,

of the meridian of Paris, and 22 degrees, 4 minutes, 9 seconds west longitude, of the Meridian of Washington. Elevation, 7,344 feet above sea level. The principal products in 1904, were: aguardiente, \$696,108; barley, \$11,812; chili peppers, \$40,842; frijoles, \$33,834; haba beans, \$18,086; corn \$668,815; pulque, \$221,056; wheat, \$99,869; fruits, \$18,987; vegetables, \$88,457. In the same year there were manufactured 210,156,645 cigarettes; 49,751,025 cigars, and cotton goods to the value of \$5,714,503.45. The consumption of meats amounted to \$8,075,461.

ALBERTO R. NUNCIO,
Commissioner of Mexico to the Pan-American Exposition, Buffalo, N. Y., 1901; Chief of the Second Bureau of the Department of Public Promotion, Mexico.

MEXICO

Mexico, City of, capital of the Republic of Mexico and chief city of the Federal District. is situated in lat. $19^{\circ} 26' 5''$ N., lon. $99^{\circ} 6' 45''$ west from Greenwich, at an altitude of 7,434 feet above the level of the sea, near the centre of the Valley of Mexico. This is a marshy table-land, about 60 miles long, 30 miles wide and enclosed at all points by high mountains. The climate of the city is mild. The temperature ranges from 35° to 90° F., but it seldom falls below 60° or rises above 80° (in the shade), the mean being between 60° and 70° . The nights and mornings are cool throughout the year, the hottest months being April and May.

Topography and Streets.—It has an area of more than 20 square miles. Its population (census of 1900) was nearly 370,000. It is the largest and finest city of Latin America; at the beginning of the 19th century the largest city in the Western hemisphere, "the handsomest capital in America," said Humboldt at that time. It is the political, the commercial, the educational centre of the republic, indeed the centre of every line of national activity. It is to Mexico, it has been said, what Paris is to France. It is distant by rail from Vera Cruz, on the Gulf of Mexico, 263 miles; Acapulco, on the Pacific, 290 miles; El Paso, Texas, 1,224 miles. Its streets, of which with lanes there are more than 900, are straight, extending from north to south, and east to west, and intersecting at right angles. The city is growing chiefly toward the southwest, but in this new section, the streets are not laid out as regularly as in the old. The principal ones are broad, well paved with asphalt, well kept, and bordered with good sidewalks. Square, flat-roofed buildings of two or three stories, built round a *patio* (court yard) open to the sky, line the streets. Their walls are thick, of stone or brick, generally covered with stucco. The windows open on to neat little balconies. Some of the finest buildings are faced with porcelain tiles of different colors, arranged in beautiful patterns; their patios being adorned with pretty gardens, fountains, and statuary. Owing to the marshy soil none of the buildings have cellars, and because of the possibility of earthquakes and the mildness of the climate all, in the old part of the city at least, have no chimneys. For cooking, charcoal is used in *braseros* (brick stoves). The street nomenclature is peculiar. A continuous line of street generally has a different name at every block. In 1889 the streets were re-named. All extending east and west were named *avenidas*; all north and south *calles* (streets), one name being given to a continuous thoroughfare. But the people, especially the uneducated classes, clung so tenaciously to the old names that the authorities yielded and the former names were restored. There is no exclusively residential section, one of the handsomest residences often being found between two business houses in the heart of the city. The principal business street is named Los Plateros (the silversmiths) for two blocks, and San Francisco for the next three. It is also the most fashionable shopping street. Next in importance to Los Plateros is Calle Cinco de Mayo (Street of 5th of May), the name commemorating the repulse of the French by the Mexicans at Puebla in 1862. Both these streets start from the main square. Some of the streets are named for distinguished men of Mexican history. Others have religious names, taken

from names of churches situated thereon, as Street of Holy Ghost, Jesus, Sanctified Virgin, and the like. Still others have very odd names, as Lost Child, Sorrow, Sad Indian. The street car service, owned and operated by English capitalists, is excellent. A system of electric traction covers the entire city and connects all the suburban towns. In 1902 these lines carried 30,000,000 passengers. Hearses are almost unknown, special street cars being used to convey to the cemetery both the dead and mourners.

Parks and Public Buildings.—The principal square is the Plaza Mayor de la Constitucion, situated in the centre of the city. It covers 14 acres, but is only part of the ground enclosed by the walls of the *teocalli* (temple) of the ancient Aztec city. Its centre is occupied by a park named the Zocalo. The entire eastern side of the plaza is bounded by the National Palace, which is said to occupy the site of Montezuma's palace. The present building was begun in 1699 and has been added to from time to time till now it has a frontage of nearly 700 feet. It is two stories high and architecturally the least attractive public building in the city, being long, low, and monotonously plain. Originally it was the residence of the rulers of Mexico, but for many years has been devoted to housing some of the executive departments of the national government, including the President's offices. The federal senate meets here temporarily until the magnificent federal capitol, which is under construction, shall have been erected. On the second floor and extending the length of nearly the entire front is the Hall of Ambassadors, with its walls hung with portraits of Mexican rulers since independence was won, besides a full-length likeness of Washington. Over the main entrance hangs the Liberty Bell, with which, in his church at Dolores, the father of Mexican independence, the priest Hidalgo, called his people to arms on the night of 15 Sept. 1810. It was moved to its present location in 1896, and since, a feature of every celebration of the anniversary of the declaration of independence is the ringing of this bell at midnight by the President. On the north side of the Plaza Mayor is the cathedral, the city's chief architectural feature, its most majestic, most imposing edifice. It occupies a part of the ground enclosed by the walls of the ancient Aztec temple. It covers a greater area than any other church in the Western hemisphere, and is surpassed in this respect by only two in the whole world—St. Peter's at Rome and the Spanish cathedral at Seville. The walls are gray stone. From the sides of the façade rise two bell towers. The whole pile is crowned by a central tower which commands a superb view of the city and the surrounding valley. It was begun in the last half of the 16th century and more than two centuries elapsed before it was entirely finished. Altogether, both outside and in, it has cost many millions. The railing of the choir is made of a composite of gold, silver, and copper and is said to have cost \$1,500,000. The interior contains also some exquisite wood carving and some excellent paintings, the best being one by Murillo, in the chapter-house. In this cathedral in 1822 Agustín Iturbide was crowned Emperor of Mexico, and here he is buried, his coffin bearing simply these words: "The Liberator." Here too in 1864 the Austrian archduke Maximilian and his wife

MEXICO

Carlotta were crowned emperor and empress of Mexico. Other churches especially noteworthy are Profesa, one of the most beautiful; Santo Domingo, one of the largest; San Hipolito, and San Francisco, the most interesting historically. In the latter of the last two Cortes worshipped and for many years lay buried. Here Iturbide attended the celebration of Mexican independence and here was held his funeral.

To the rear of the National Palace is the National Museum, containing a large and very valuable collection of Mexican antiquities, as well as many treasures identified with the nation's history from the earliest down to recent times. Some of the most valuable archaeological remains have been found a few feet below the surface while excavating within the grounds which were once enclosed by the walls of the Aztec temple. The most important of these treasures are the Sacrificial Stone, the Aztec Idol of War and Death, and the Stone of the Sun. The last is often erroneously called the Calendar Stone; the archaeologist, A. F. Bandler, says it was undoubtedly used for sacrificial purposes. Besides these there is an almost endless array of small stone specimens, as well as tools, arms, weapons, picture-writing and feather work. In the section of national history is the banner borne by Hidalgo during his struggle for the independence of the colony, the standard belonging to Cortes, and carried through the period of the Conquest, and Maximilian's silver table-service and coach of state.

Near the National Palace is the National Academy and School of the Fine Arts, founded in 1778. It attracted the favorable notice of Humboldt during the year he spent in the city at the beginning of the 19th century. Its collection of casts, he said, was better than any to be found in Germany. It contains paintings ascribed to Murillo, Rubens, Velasquez, Leonardo, but its greatest work, the one pronounced by distinguished art critics one of the great paintings of the world, represents the Spanish priest and historian, Las Casas, protecting the Aztecs. It is the work of a native artist and received the first prize in the Academy of Rome. The Academy receives from the government an annual allowance of \$35,000. A large part of this sum is spent in prizes. The one which is most eagerly competed for being the one which enables the recipient to study art in Italy—a prize of \$600 a year for six successive years. In the day and night school connected with the Academy the tuition is free.

The National Library is housed in a fine building, once the Church of Saint Augustin, which like other religious foundations, in 1859 when the Laws of Reform took effect, became the property of the state. Portrait busts of distinguished Mexicans ornament the fence enclosing the gardens at the sides. Along the walls of the interior are ranged statues of the greatest men in literature of all times and places. The library contains more than 225,000 volumes. When the monasteries were suppressed, their libraries were gathered here and the collection therefore is especially rich in ecclesiastical literature. In 1537 the first book printed in the New World was printed in the City of Mexico on a printing-press brought from Spain. Its title: 'Escala Espiritual para Llegar al Cielo' (Spiritual Ladder for Reaching Heaven). No copy of

this work remains, the oldest work extant being a history of Tenochtitlan (Mexico) published in 1543. In this city was printed the first music printed in the New World, the first engravings from wood, the first newspaper, 'Mercurio Volante' (Flying Mercury), and antedating the first paper in the American colonies by more than ten years. Besides the National there are several small libraries with collections ranging in size from 7,000 to 14,000 volumes. The national archives are stored in the National Palace.

The largest and most beautiful park and public garden is the Alameda, situated about half a mile west of the Plaza Mayor, and bounded on the south by the Avenida Juarez. It covers about 40 acres, which include the lot wherein the victims of the Inquisition were burned. It is intersected by pleasant walks, shaded by fine trees, adorned with flower beds, flowering shrubs, and fountains. Concerts, attended by all classes, are given here every Sunday afternoon. A very short distance from the Alameda, the Avenida Juarez opens into the Paseo de la Reforma, one of the most beautiful avenues in the world. It was designed by Maximilian, who named it the Boulevard Emperiale. It is the fashionable afternoon drive and promenade. Broad at first, it has recently been enlarged to twice its original width. It is over two miles long and is lined on each side by double rows of lofty trees, beneath which are foot-ways and at their sides stone benches. Starting at the equestrian statue of Charles IV. of Spain it expands at regular intervals into *glorietas* (circles), some of which are adorned with monuments of the greatest men in Mexican history. This statue of Charles IV. is one of the city's finest works of art. Humboldt said that next to the equestrian statue of Marcus Aurelius at Rome, it was the best work of its kind in the world. It was made in Mexico at the beginning of the 19th century, it being the first important piece of bronze cast in America. At another circle is a statue of Columbus, and still further on one of Guatemotzin, the last of the Aztec kings.

The Paseo extends to the gates of Chapultepec, a rocky height rising abruptly from the level of the surrounding plain. A beautiful park, set with gigantic cypresses, which are said to antedate the Spanish Conquest, encircles the base of the rock. A palace crowns the hill, a part of which is occupied as the summer home of the President, the rest being used by the National Military Academy. Back of the hill is the battle field of Molmo del Rey. The view from the front is regarded one of the most beautiful in the whole world,—the long vista of the Paseo de la Reforma to the city, standing in the centre of the valley, encircled by high mountains from which rise the snow-capped peaks, Ixtaccihuatl and Popocatepetl, 16,060 and 17,782 feet respectively above the level of the sea. In the park at the base of the rock there is a monument to the Mexican cadets who fell in 1847 while defending the hill from the assault of the American army. As evidence of the mutually good feeling existing between the local population and the American residents, on each American Memorial Day, the latter place flowers on this monument while the former do the same to the graves in the cemetery of the American soldiers who died during the American invasion.

CATHEDRAL IN THE CITY OF MEXICO.

MEXICO

The chief suburbs are: Tacubaya, San Angel, Coyoacan, Popotla, Guadalupe, and the towns along the line of the Viga Canal. All are within a radius of eight miles of the centre of the city. The Viga Canal is about eight miles long and connects the city with lakes Xochimilco and Chalco. From the gardens along this waterway come the flat-bottomed boats loaded with vegetables, fruits, and flowers for the city market. On Sundays and feast-days it often presents a very lively and picturesque sight, covered with boat-loads of people on their way to the picnic grounds of Santa Anita, a little Indian village of straw-thatched huts. Surrounding it are the *chinampas* (floating gardens). That they once floated is doubtful; at all events they are stationary now and are mere patches of marshy ground intersected by narrow channels, and used as market gardens. At Ixtacalco are other floating gardens. A road, the Paseo de la Viga, borders one side of the canal. Guadalupe contains the shrine of the Virgin of Guadalupe, the patron saint of Mexico. Here the treaty of peace, following the war of 1847 with the United States, was signed. At Popotla is the famous tree, *L'Arbol de la Noche Triste* (the tree of the dismal night), beneath which Cortes is said to have sat and wept the night of 1 July 1520, after his expulsion from the city. Coyoacan is even older than the City of Mexico. Cortes made it the seat of government while he superintended the rebuilding of the conquered city. The house in which he lived is still standing. San Angel is a beautiful little town, well known, too, for its excellent fruits, flowers, and vegetables. At Tacubaya is the national astronomical observatory. It contains also many very pretty houses where the wealthy residents of the capital pass the summer.

Commerce and Industry.—The city is the commercial and industrial centre of the republic. It possesses several wealthy banking institutions, the largest being the National Bank of Mexico with a capital of \$32,000,000.

It had in 1903 several hundred factories, including corn, flour, paper, and coffee mills; iron and type foundries; manufactories of cigars, hats, furniture, glass, pottery, rope, wire, starch, glue, soap, musical instruments, and many others. Dun's Agency for February 1903, states that dry goods' dealers report that 60 per cent of the goods sold are of domestic manufacture.

Transportation.—The railways which centre in the City of Mexico are: The Mexican Central, which runs almost due north to El Paso, Texas, 1,224 miles; The Mexican, the first completed line in Mexico, extending to Vera Cruz, 263 miles, the Cuernavaca Division of the Mexican Central, extending to Cuernavaca, and Rio de las Balsas, with ultimate terminus at Acapulco; the Interoceanic, extending to Vera Cruz, the National, extending to Laredo, Texas, 830 miles.

Municipal Administration.—The Palacio del Ayuntamiento (city hall) is situated at the south side of the Plaza Mayor. The present building dates from 1730. In its council chamber are portraits of all the governors of Mexico from Cortes. The government of the city from the beginning, for nearly 400 years, till the end of June 1903, had been vested in a city council, composed of aldermen, a mayor, and a governor of the Federal District. On 1 July the new law, creating a change in the form of government became operative. The Federal District, of which

the City of Mexico is the chief city, is now governed similarly to the District of Columbia, United States. The powers of government and administration are lodged with three federally appointed officials, namely, the governor of the District, the president of the superior board of health, and the director of public works. Besides the special powers belonging to each of these officials, the three may act together as one superior governing body. Each town within the Federal District continues to elect its own board of aldermen, but their powers now are restricted to those of advice, supervision, and veto. The board of each town may suggest measures to the three district commissioners for the benefit of its own constituents; it may see that measures adopted for its own constituents are properly carried out; it may suspend public works by a veto which can be annulled only by the President of Mexico, acting with the advice of his cabinet. Municipal affairs are excellently administered. The city is well policed. Over 500 unmounted policemen are always on duty, one being stationed at every corner. The street cleaning department keeps the streets in good condition. The city is lighted chiefly by electricity. The service includes 516 arc lights of 2,000 candle-power, 430 of 1,200 candle-power, and some 200 incandescent lights. Two lotteries exist, but other gambling concerns have been closed for more than a year.

The city issues licenses to 1,900 shops for the sale of wines, liquors, beers, and pulque. All *pulquerias* (pulque shops) are closed at six o'clock throughout the year. Drinking-places of all kinds by a new law are closed at noon Sunday and remain closed till Monday morning. This has resulted in reducing the number of Sunday arrests for crime to one third the former number. The providing an adequate water-supply has long been a problem to the municipality. President Diaz in his message at the opening of Congress, September 1903, states that the solution of the problem is in sight. At present the water comes from six different sources outside the city, which yield about 36,800 litres per minute, and from eleven public and 1,375 private artesian wells in the city, which yield about 22,000 litres per minute.

Public Works.—The city is situated at nearly the lowest point in the valley, and from the earliest times had always been in danger of inundation. There are six lakes (so called) within the valley, all of which, with the exception of Texcoco, are above the level of the city. In times of heavy rains their waters sometimes overflowed the banks and having no outlet through the surrounding mountains, found their way to Lake Texcoco which being only two or three feet below the level of the city, rose sufficiently to flood it. Before the Spanish Conquest and for some time afterward dikes were built about the city to keep the flood waters out, but these proved ineffective. Inundations occurred on an average once in 25 years. In 1608 the cut of Nochistongo was made through the mountains, as an outlet for the flood waters of the highest lake in the valley which is 13 feet above the level of the city. But this work only partly relieved the situation. In 1629 there was another flood and the city was submerged to a depth of three feet for five years. This paralyzed business and caused great loss of life and property. The

MEXICO

Spanish government ordered the site of the city to be changed to higher ground. But presently, owing to a very dry season and to earthquakes, the waters passed away and the royal order was not carried out. The present canal and tunnel is the joint undertaking of the city and of the national government. It is designed to serve a twofold purpose: to control the waters of Lake Texcoco, thus removing all possibility of future inundations; to be a continuation of the city's sewerage system. It starts just east of the city, where it joins the network of city sewers. It extends to the mountains, a distance of 30 miles, connecting with Lake Texcoco, on its way. It pierces the mountains by a tunnel seven miles long, and beyond the mountains is continued as a canal for several miles. The canal was finished in 1896. The sewerage system is now (1903) nearly completed. The city can never again be inundated and it is now provided with an effective sewerage system of which from the very beginning of its existence it had been in the greatest need.

Finances.—In 1902, the municipal taxes yielded a revenue of \$6,500,000 (Mexican silver). The expenditures for the same period were \$4,000,000. In the list of taxes on personal property in 1902, 819 private carriages paid a monthly tax averaging about \$10 each; 4,015 bicycles, \$1 a month each; 2,700 carts and wagons an average monthly tax of \$5 each. In 1902 the licenses from 1,230 tobacco stores; 854 places where wines, liquors, and beers were sold; 972 pulquerias (pulque shops) yielded the city a monthly revenue of about \$65,000. Licenses from 61 pawnshops in 1902 yielded a revenue exceeding \$8,000 a month. The tax on tradesmen is proportioned to the volume of business. The tax on street peddlers and small booths is collected daily, the amount depending upon the stock on hand. Taxes as low as a few cents a day are collected. The water-tax yields a revenue (1903) of about \$250,000 annually. The tax on rents is about 12 per cent, houses unoccupied not being taxed at all. Among the municipal expenditures in 1902, were those for: water, which averaged about \$30,000 a month; street cleaning, about \$13,000 a month; lighting, about \$26,000 a month.

Population.—The native population embraces descendants of Spaniards, and of some other Europeans, Indians, and mixed races. The foreign population consists mostly of Spaniards, Americans, Germans, French, and English. In 1902 there were 6,000 American residents engaged in business. The great majority of these are in the employ of railroads and mining companies, or represent United States business houses. Almost all the shop-keepers are either French or Germans, a few are Spaniards, hardly any are Jews, and a few are Americans. The total population in 1900 was 370,000.

Public Health.—The death rate has always been very high, sometimes reaching 50 per 1,000. This high rate has been owing partly to the great infant mortality among the very poor, especially the peon class; partly to very defective drainage. With the completion of the excellent system of sewers the death rate will no doubt be greatly lowered. Referring to this matter, President Diaz, in his message at the opening of Congress, in September, 1903, stated that during the first half of: (1901) the deaths numbered 12,100; (1902) 10,442; (1903) 8,858.

Education.—The public school system of the country has its centre in the City of Mexico. The schools are divided into three grades, namely, primary, advanced primary, and national preparatory. Attendance at the first is compulsory. The work covers from four to six years and comprises chiefly the elementary studies. The second grade carries on the work of the first, and includes also French and the natural sciences. The national preparatory aims to prepare for the professional schools. The course of study extends through six years. The first two are devoted almost exclusively to the study of mathematics, French, and Spanish. The work of the remaining four years includes the literatures of Germany, Spain, and Mexico. Neither Latin nor Greek is taught in the public schools. These schools are supported both by the city and by the federal government.

Besides the public schools supported by the government there are also free primary schools maintained either by Roman Catholics or Protestants. There are also a great many private pay schools. Among the professional schools are those of law, medicine, theology, fine arts, music, and the applied sciences. All the professional schools are independent of each other. The friends of education in the city hope to see the national preparatory and the professional schools consolidated into a national university.

Newspapers.—There are 15 daily newspapers. The *Herald* and the *Record* are in English. *El Imparcial* has the largest circulation of any newspaper in all Mexico. The official government organ is *Diario Oficial*.

Religion.—Roman Catholicism is the religion of all but a very small part of the population. There are 11 Protestant churches, including two Methodist, two Episcopal, two Presbyterian, one Baptist, one Christian Scientist. Nearly all these denominations maintain missions, both in the city and in other parts of the country. A Young Men's Christian Association has been formed and has a membership of 430, more than half of whom are Americans, the next numerically being Mexicans and English. A Women's Christian Temperance Union has also been lately organized. All these worthy undertakings receive the encouragement of President Diaz.

Charities.—There are a great many charitable institutions. Of these more than 20 are hospitals, the oldest being that of Jesus Nazareno, founded by Cortes. A general hospital, nearing completion (1903), is to consist of 60 separate buildings and will be one of the largest in the world. Besides these public hospitals, there are also several private ones, maintained by voluntary contributions. There are also asylums for the poor, insane, blind, and foundlings. A unique and very remarkable benefaction is the Monte de Piedad (Mountain of Mercy), the national pawnshop. It was founded in 1774, by a wealthy mine owner for the sole purpose of lending to the poor, on pledges, sums of money, at very low rates of interest, thus protecting them from the extortionate charges of private pawnbrokers. After a certain length of time the unredeemed pledges are sold, and when all expenses are paid the balance in each case is returned to the original owner.

Amusements.—Sunday is the day of all others for recreations and amusements. After the morning service at the churches the day is

MEXICO.

THE CROWD IN THE PLAZA MAYO, GATHERED ABOUT THE CATHEDRAL ON A FEAST DAY.

MEXICO

given up to pleasures. First, the band concert in the Alameda; in the afternoon the bull fight; and the theatre in the evening. There is now but one bull ring in the city. It has a seating capacity of 15,000 and is sometimes crowded. The government has tried to abolish this sport, and laws have been passed to this end, only to be repealed, so strong have been the protests of the masses of the people against this action. The old theatre, the Teatro Nacional, has been replaced by a commodious structure at the terminus of Cino de Mayo street. There are also several smaller theatres.

Pulque.—The national beverage of Mexico is pulque. It was in use at the time of Cortes and no one knows how long before. It is made of the fermented juice of the *agave Americana*, or century plant. One plant will often yield two gallons a day. Special pulque trains from the country arrive daily. Eighty thousand gallons are said to be consumed daily in the city alone.

History.—Of what often passes for the history of the city before the Spanish Conquest, and indeed, for many years after, it would be hard to tell how much is true, and how much false. But there is no doubt that it was founded by the Aztecs. It is generally accepted as true that they came from some unknown region in the Northwest, perhaps north of the Gulf of California, that for more than 100 years they wandered in the Mexican Valley, that they settled near the centre of the valley on islands of Lake Texcoco, in the early part of the 14th century. Tradition says they were directed by the oracle to settle where they had seen, perched on a cactus, an eagle devouring a snake. Hence the centre of the national coat-of-arms. The original name of the city was Tenochtitlan.

In the centre was the great *teocalli* (temple). The first rude houses, standing on piles, and built of mud and rushes, before the Spanish Conquest had been replaced by buildings of stone. The city had a radius of about half a mile; an area of about one quarter that of the present city. It was intersected by canals; hence sometimes called the Venice of the Western world. With the mainland it was connected by causeways. During the Spanish Conquest (1519-21) the Aztec city was completely destroyed, not a vestige of it remaining. No trustworthy record exists as to the size of the population at this time. One contemporary writer states that it was 500,000; another, 30,000. On the same site in 1522 Cortes began the building of the Spanish city. But so many changes have been made since then that the city of to-day retains hardly a trace of the city founded by Cortes. In 1600 its population consisted of 7,000 Spaniards and 8,000 Indians. In 1746 it had a population of 90,000; fifty years later one of 113,000.

For nearly 300 years it was the capital city of New Spain. Some of the viceroys were good men and able rulers and among other good deeds, did much to improve the condition of the city. Events, not already mentioned, especially noteworthy in the life of the city, were: the riot of 1692, provoked by a famine, and causing the loss of more than \$3,000,000 worth of property; the capture of the city by Agustín Iturbide and his triumphal entry 27 Sept. 1821, the date which marks the end of Spanish power in Mexico; Iturbide's election as emperor, 22 May 1822; the capture of the city in 1847 by

the Americans under Gen. Scott; the taking effect in 1859 of the Laws of Reform, and the consequent suppression of convents and monasteries, and the confiscation of church property; the capture of the city by the French, 9 June 1863; its capture 21 June 1867 by the Liberal army led by General Díaz; the return to the city nearly a month later of President Juárez. Since the beginning of President Díaz's second administration in 1884 the city has had a period of uninterrupted peace. His enlightened, liberal, and progressive policy has greatly improved not only the condition of the country but that of the city as well. It is becoming modernized and filled with new life.

ISAAC F. SMITH, M.A.

Mexico, Gulf of, an arm of the Atlantic Ocean, bounded on the north by the United States and on the south and west by Mexico. It is oval in form; its greatest length is from east to west, about 1,000 miles; from north to south, about 800 miles; area, about 700,000 square miles. It has a continuous coast-line of about 3,000 miles. Its maximum depth is about 12,715 feet, and within the basin, exclusive of the submerged coastal plain, the average depth is about 9,000 feet. In former ages the area of the Gulf was much greater than at present; it included the lower basin of the Mississippi, Florida, a large part of eastern and southeastern Mexico, and the basins of the northern rivers of South America. The outlet of the Gulf is on the east, between the peninsulas of Yucatan and Florida, a distance of 450 miles. At this outlet is the island of Cuba, which is separated from Florida by the Strait of Florida, 125 miles wide, and from Yucatan by the Yucatan Channel, 120 miles wide. The Yucatan Channel opens into the Caribbean Sea and the Florida Strait enters the Atlantic.

The temperature of the Gulf is from 8° to 9° higher than in the Atlantic in the same latitude. The temperature at the point of greatest depth is 39½°, or the same as the temperature at the greatest depth of the Yucatan Channel, although the maximum depth of the Gulf is about 3,943 feet more than that of the channel. The chief current is the Gulf Stream (q.v.) which enters the Gulf through the Yucatan Channel, circles the interior and passes out through Florida Strait. The winds are about as on other parts of the globe where north-equatorial conditions exist; the prevailing winds from the north blow from September to March, and from the south from March to September. The severe gales are in the winter. The northern part of the Gulf, from Mexico to Florida, is really a coastal plain averaging from 40 to 100 miles

wide. The basin off the Mexican coast sinks rapidly to the submarine plain, and a short distance from shore reaches the maximum depth. The Bay of Campeachy is the largest indentation. Other bays are Havana, on the coast of Cuba, Pensacola, Tampa, Mobile, and Galveston, on the United States coast, and Vera Cruz on the coast of Mexico. A number of small bays and lagoons are on the western coast. The principal islands are at the entrance of the Gulf; Cuba the largest, and north of Cuba, the Florida Keys, a group of coral islands. There are a number of small islands in the southeastern part of the Gulf, off the coast of Yucatan, and some in the Bay of Campeachy. The delta of the Mississippi consists of low, marshy islands. The principal rivers which flow into the Gulf are the Mississippi, the Colorado, Brazos, Sabine, Mobile, and the Appalachicola from the United States, the Rio Grande on the boundary between the United States and Mexico, the Rio Verde, and several short streams from Mexico. The chief cities on the coast are Havana, Florida Keys, Tampa, Mobile, Galveston, and Vera Cruz. New Orleans and Houston have direct ship communication with the Gulf, and Mexico City uses Vera Cruz as its port.

Mexico, a state of the United States of Mexico; in the southeast; bounded by the state of Hidalgo on the north; on the east by Tlaxcala and Puebla, on the south of Morelos and Guerrero, and on the west by Michoacan and Queretaro. See MEXICO—THE STATES OF.

Mexico, Mo., city, county-seat of Andrain county; on Salt River, and on the Wabash and the Chicago & Alton R.R.'s; about 115 miles northwest of Saint Louis. Mexico was settled in 1833 and in 1852 was incorporated. It is in an agricultural section, the chief products of which are wheat and corn. The manufactures are dressed marble, wagons, plows, flour, stove lining, fire-brick, and foundry products. Mexico is the seat of the Missouri Military Academy, and of the Hardin College for Women, founded in 1873. The charter under which the government is administered was granted in 1893, and provided for a mayor who holds office two years, and a council. Pop. (1910) 5,939.

Meyer, mî'ér, Édward, German historian: b. Hamburg 25 Jan. 1855. He was educated at the universities of Bonn and Leipsic, and after completing his studies spent one year in Constantinople. In 1879 he went to the University of Leipsic as *privat-docent*; in 1885 became professor of ancient history at Breslau, and in 1889 at Halle. He has written 'Geschichte der Alten Ägypten' (1877); 'Geschichte des Altertums' (1884-1902), his largest work; 'Forschungen zur Alten Geschichte' (1892-9); 'Untersuchungen zur Geschichte der Gracchen' (History of Greece) (1894); 'Wirtschaftliche Entwicklung des Altertums' (1895); and 'Die Entstehung des Judentums' (1896).

Meyer, Heinrich August Wilhelm, German biblical commentator: b. Gotha 10 Jan. 1800; d. Hanover 21 June 1873. He studied at Jena, was pastor at Harste, Hoyer, and Neustadt, and upon his retirement in 1848, settled in Hanover. He is remembered for his 'Commentaries on the New Testament,' begun 1832. Since his death this work has been continued by Weiss, Wendt, Beysschlag, and others. The English translation

in Clark's series is in 20 volumes (1873-82), and there is an American edition in 11 volumes (1884-8).

Meyer, Johann Georg, yō'hān gā'ōrg, commonly known as "Meyer von Bremen," German painter: b. Bremen 28 Oct. 1813; d. Berlin 4 Dec. 1886. In his twenty-first year he went to Düsseldorf and began his studies under Sohn and Schadow; in 1841 he opened a studio of his own but removed to Berlin as his fame increased (1853). While scenes from the Bible were first the subjects of his brush, he later turned his attention to incidents of popular life, especially among the Hessian peasantry, and finally to the portrayal of family life in its pathetic aspect. Such pictures as 'The Jubilee of a Hessian Pastor' (1843); 'Christmas Eve'; 'Blindman's Buff'; 'The Soldier's Return'; 'The Inundation' (1846); 'The Repentant Daughter' (1852, in the gallery at Bremen), are full of intense sympathy with the homely "annals of the poor." After taking up his residence at Berlin, he chose especially scenes from child life, which he rendered with spirited humor. Among his pictures of this kind are 'The Fairy Tale'; 'Children Playing Blindman's Buff'; 'Grandfather and Grandchild'; etc. A third group of his pictures includes those of young women, as single figures or in groups. Such are 'The Tryst'; 'The Love Letter.' All his works are distinguished by true human feeling, truthfulness and thoroughness of execution.

Meyer, Joseph, German publisher: b. Gotha 9 May 1796; d. 27 June 1856. He organized various industrial undertakings, founded a publishing business at Gotha, which soon attained large proportions, was removed by him to Hildburghausen (1848), and in 1874 was transferred to Leipsic. The best-known of his publications is the 'Meyers Konversationslexikon,' the rival of Brockhaus in the encyclopaedia field, which has been brought down to date by constant revisions and supplements. He published also a series of the German classics, a 'Historical Library,' and a 'Library of Natural Philosophy.'

Meyer, Klaus, German painter: b. Linden, Hanover, 20 Nov. 1836. He entered the Art School at Nuremberg in 1875, studied there 12 months, and subsequently became a pupil of Wagner and Löffitz at Munich. The result of their teaching, added to a patient study of the Dutch masters of the 17th century, appeared in the delicacy, vivid characterization and refined coloring of his work, which won him a place among the first of living Dutch painters. These qualities are exhibited in a Dutch interior produced by him (1882) in which are two figures in the costume of the 17th century. This work recalls the finest creations of Pieter de Hooch (q.v.), and Van der Meer von Delft (q.v.), although Meyer prefers an atmosphere of cool silver tone to the warm golden lights of those masters. Another interior, a Beguin monastery scene (1883) won for him the grand gold medal at the International Art Exhibition at Munich. He painted many pictures in a similar vein, such as 'The Monastery School'; 'The Singing Nuns'; 'Old and Young Cats' (in the Dresden Gallery 1885); 'The Spy,' an incident in the Franco-Prussian War; and 'Lady Reading a Letter' (1892). In 1891 he was appointed instructor in the Art Academy at Karlsruhe, and

1835 professor in the Art Academy at Düsseldorf. At the Berlin Exhibition of that year he was awarded the grand gold medal.

Meyerbeer, mî'r-bâr, Giacomo (Italianized form of Jakob Meyer Beer), German composer: b. Berlin 5 Sept. 1791; d. Paris 2 May 1864. His father, Jakob Beer, was a rich banker of Jewish descent, and of high reputation in the commercial world. The son gave early proof of his devotion to the art of music, and at nine was regarded as a masterly pianist in a city full of excellent musicians. After studying composition under Bernhard Anselm Weber he entered in 1810 the school of the Abbé Vogler at Darmstadt, where for three years he had the companionship of Karl Maria von Weber (q.v.). An intimate friendship sprang up between them, which was only interrupted by the death of the latter. While at Darmstadt Meyerbeer composed a cantata, 'Gott und die Natur,' which brought him the appointment of court musician to the grand-duke. In 1812 his opera 'Jephthas Tochter' was produced at Munich, but failed to please the audience, though highly praised by Weber, Vogler, and other musical authorities. Discouraged by its public reception, Meyerbeer went to Vienna, where he made his debut as a pianist with such success that he seemed destined to eclipse the fame of all contemporary artists. Commissioned by the court of Vienna he produced 'Abimelek, oder die beiden Kalifen,' which was no more successful than his former effort. He was induced to visit Italy, and became a convert to the new musical school of that country. He rapidly composed in this style a series of operas, which were generally well received:—'Romilda e Costanza' (1818); 'Semiramide Riconosciuta' (1818); 'Emma di Resburgo' (1820); 'Margherita d'Anjou' (1822); 'L'Esle di Granada' (1823); and 'Il Crociato in Egitto' (1824). The success of the last-mentioned opera traveled beyond the Alps, and the composer was invited to Paris to superintend the preparations for the production of the 'Crociato' at the Grand Opéra, where it met with an enthusiastic reception. In 1831 his 'Robert le Diable' was produced for the first time, and the excitement it caused was perhaps unparalleled on the Parisian stage. Meyerbeer had ceased to be a pupil of Rossini, and 'Robert' combined in a singular degree oriental gorgeousness, German massiveness, French vivacity, and Italian brilliancy, which the preceding works of the composer had not prepared the world to expect. He reached the climax of his fame by his next opera, 'Les Huguenots' (1836). It was followed at long intervals by 'Le Prophète' (1849); 'Pierre le Grand' ('L'Etoile du Nord' 1854); 'Le Pardon de Ploermel' ('Cinorah' 1858), and 'L'Africaine' (1865). The composer did not live to see the production of his last work. Besides his operas he wrote many songs, an oratorio, cantatas, a Te Deum, music for the tragedy of 'Struensee' by his brother, and other works. Consult: Pougin, 'Meyerbeer' (1864); De La-salle, 'Meyerbeer, sa Vie Catalogue de ses Œuvres' (1864); De Bury, 'Meyerbeer, sa Vie, ses Œuvres et son Temps' (1865); Mendel, 'Giacomo Meyerbeer, eine Biographie' (1868).

Meyerheim, Friedrich Eduard, frêd'rih ed'oo-ard mî'r-him, German artist: b. Dantzic 7 Jan. 1808; d. Berlin 18 Jan. 1879. He studied landscape painting in his native town,

and in his 22d year went to Berlin, where he attended the Academy and fell under the influence of Schadow. Ten lithographic views of Dantzic, published by him in 1832, were included in his 'Architektonische Denkmäler der Altmark Brandenburg,' which appeared the following year. Between 1833 and 1841 he produced a number of genres with a romantic motif as illustrative of peasant and bourgeois life. Of such a character is 'The Champion Shot' (1836) in the Berlin National Gallery. In his search for character, costume, scenery and incident he traveled, studied and sketched over a wide area of territory which included Westphalia, Altenburg, Thuringia, Hesse, and the Harz district. His admirable genres are distinguished by a clear enamel-like coloring. Amongst the most notable are: 'Leaving Church in Altenburg'; 'In an Altenburg Cornfield'; 'The Little Kid' (1842); 'Bedfellows' (1844); and his masterpiece, 'Waiting' (1845). Consult his 'Autobiography' (1860).

Meyerheim, Paul, powl, German painter: b. Berlin 13 July 1842. He was a son of Friedrich Eduard Meyerheim and was taught by his father, and afterward studied at the Berlin Academy. Travel through Belgium and Holland enlarged his artistic experience and knowledge, and he afterward spent a year at Paris. He then returned to Berlin, where he applied himself to animal painting, but also did some portrait, genre of common life, humorous scenes, still life, interior decoration of buildings, etc. He executed works both in oil and watercolors, and his versatility is only equaled by his delicate sense of color and brilliant technique. Considering all these qualities his fertility must be called extraordinary. Some of his best works are: 'History of the Locomotive in Seven Pictures on Copper' (Villa Borsig, Berlin); 'An Antiquary of Amsterdam' (1869); 'Four Seasons in the Life of a Bird'; 'In the Menagerie' (1891); 'Portrait of his Father and D. Chodowiecki' (1887); 'The Theatre of Monkeys'; 'The Hare and the Frog'; 'Tourists in the Mountains Meeting a Herd of Cattle'; etc. In 1863 he undertook a journey into Egypt, from which he brought back many landscape and figure studies. He is a Royal professor, and has been awarded the grand gold medal at the Berlin Exhibition.

Meynell, mî'nêl, Alice Thompson, English poet and essayist: b. London, England. She spent much of her childhood in Italy, and was married in 1877 to Wilfrid Meynell, a London journalist. She has published 'Preludes,' a collection of poems (1875), illustrated by her sister, Lady Elizabeth Butler (q.v.); 'Rhythm of Life' (1893); 'The Color of Life' (1896); 'The Children' (1896); 'The Spirit of Place' (1898); 'John Ruskin' (1900); 'Later Poems' (1901). Consult Archer, 'Poets of the Younger Generation' (1902).

Meyrick, mî'r'ik, Frederick, English Anglican clergyman and controversialist: b. Ratbury vicarage, Wiltshire, 28 Jan. 1827. He was educated at Oxford, where he was tutor (1851-9). Since 1868 he has been rector of Blickling, Norfolk, and a canon non-residentary of Lincoln from 1869. Among his many works, some of which are controversial books in Latin, Spanish, etc., may be cited 'The Practical Working of the Church in Spain' (1857);

MEZEN—MIAMI

'Kingley and Newman' (1864); 'Justin Martyr' (1896); 'Ritual and Ritualism' (1901).

Mezen, mēz-āny', or **Mesen**, a river in the northern part of Russia in Europe. It rises in the Timan Mountains, flows north and south, forming two loops, then its course changes to the northwest, and enters the White Sea through Mezen Bay. It is about 525 miles in length. It is navigable for some distance from the mouth; but is ice-locked about six months in the year.

Meze'reon, a shrub (*Daphne mezereum*). See DAPHNE.

Mézières, Alfred Jean François, āl-frā zhōn fran-swā mā-zē-ār, French critic and politician: b. Rehon 19 Nov. 1826. He studied at the Ecole Normale and in Athens; was professor of literature at Nancy (1854-61), and at the Sorbonne; became an Academician in 1874; in politics is a member of the moderate Opportunists; and was deputy from 1881 to 1900, when he was elected senator for Meurthe-et-Moselle. Besides contributions to the 'Revue des Deux Mondes' and 'Temps' he wrote 'Shakespeare' (1861), 'Shakespeare's Predecessors and Contemporaries' (1863), 'Shakespeare's Contemporaries and Successors' (1864); 'Dante' (1865); 'Petrarch' (1867); 'Goethe' (1872-3); 'In France' (1883); 'Outside of France' (1883); 'Mirabeau' (1891); and 'Dead and Living' (1898).

Mezzanine, in architecture, a low window occurring in attics and entresols. Sometimes applied to an entresol. A mezzanine story is a half story; one lower than the stories above and below it. In theatres it is usually a floor between the stage and the bottom of the deep cellars of large theatres, from which floor the short scenes and traps are worked, the large scenes going down through openings into the cellar; hence the name, from being midway between the stage and cellar floor.

Mezzofanti, Giuseppe Gaspario, joo-sēp'pē gās-pār'dō mēd-zō-fān'tē, Italian linguist: b. Bologna 17 Sept. 1774; d. Rome 15 March 1849. He studied at the seminary of Bologna, and took priest's orders in 1797. He was appointed librarian and professor of Oriental languages at the university, in 1831 went to Rome, there succeeded Angelo Mai as keeper of the Vatican Library (1833), and in 1838 was made cardinal. It is said that he was familiar with over fifty languages, and even with the provincialisms of these various tongues. Byron called him "a monster of languages, the Briareus of parts of speech." His library and his papers came into the possession of the University of Bologna. His attainments were not entirely limited to proficiency in languages, but only one printed work of his, a eulogy of Emmanuele da Ponte, a Spanish Jesuit who had taught him Greek, is in existence. Consult the 'Life' by Russell (1858; 2d ed. 1863); Manavit, 'Esquisse Historique sur le Cardinal Mezzofanti' (1854); 'Quarterly Review,' Vol. CI.

Mezzotint, mēz'sō-, a process of engraving on copper which dates from the 17th century. The smooth plate of the metal is abraded with a file-like tool, and tiny points are raised over the surface. These points catch and hold the ink, and an impression taken from a plate in this condition would give a soft velvety mass of black without variety of light and shade. A burnisher

is next used to get rid of the raised points where half tones and lights are wanted. Sometimes where very brilliant high lights are required, they are cut away so as to insure a smooth surface of copper. By means of this burnishing process, all gradations of light and shade are obtained from the white of the smooth copper to the black of the roughened plate.

Mhow, m-how', India, town and British cantonment, in the Rajput state of Indore, 13 miles southwest of Indore. The town, situated on an eminence above the Gumber, is European in its appearance, having a church with a conspicuous steeple, a well-furnished library, a spacious lecture-room, and a theatre. The cantonment, occupied by a considerable force, in virtue of the Treaty of Mandasaur, is situated half a mile southeast of the town, at the height of 2,019 feet above the sea. Mhow was one of the centres of the Sepoy mutiny of 1857. Pop. about 37,000.

Miagao, mē-ā-gā'ō, Philippines, a pueblo of the province of Iloilo, Panay, on the southern coast of the island on Iloilo Strait, 22 miles west of Iloilo, the provincial capital. Pop. 22,100.

Miako, mē-ā-kō. See KIOTO.

Miall, mī'al, Edward, English non-Conformist politician: b. Portsmouth 8 May 1809; d. Sevenoaks, Kent, 29 April 1881. He studied at Wymondley Theological Seminary, Hertfordshire; was pastor of independent chapels in Ware, 1831-4, and in Leicester, 1834-41; then removed to London, where he founded the "Non-Conformist," a weekly devoted to disestablishment; and in 1852 was elected to the House of Commons. He urged the disestablishment of the Irish Church in 1856, and repeatedly moved for the formation of committee on English disestablishment. He retired from Parliament in 1874, and received a subscription of 10,000 guineas in 1873. He wrote 'The Non-Conformist Sketch Book' (1845), 'The British Churches in Relation to the British People' (1849); 'An Editor off the Line' (1865), and 'Social Influences of the State Church' (1867). Consult the 'Life' by his son Arthur (1867).

Miall, Louis C., English naturalist: b. Bradford 1842. He was made curator of the Leeds Literary Society in 1871 and professor of biology in Yorkshire College in 1876. He is a fellow of the Royal Society and an examiner for the Indian Civil Service; became president of the zoological section of the British Association in 1897; and has written 'Object Lessons from Nature' (1891); 'Anatomy of the Indian Elephant' (1878); 'Natural History of Aquatic Insects' (1895); 'Round the Year' (1896); 'Thirty Years of Teaching' (1897); 'Injurious and Useful Insects' (1902).

Miami, mī-ām'tē or -ī, a river of Ohio, which rises in Hardin County and flowing south and southwest for a distance estimated at 150 miles, passing Troy, Dayton, and Hamilton, enters the Ohio River at the southwest corner of the State, 20 miles west of Cincinnati. It is a rapid stream, passing through a picturesque and fertile country, and admits of navigation for only a portion of its length. Its principal branches are the West Branch, the Mad and the Whitewater rivers. The Miami canal runs along the river for about 70 miles, and together they furnish extensive power for manufacturing pur-

MIAMI INDIANS—MICA

poona. This river is sometimes called the Great Miami, in distinction from the Little Miami, which rises in Madison County, and after a southwest course of about 100 miles, nearly parallel to the former, enters the Ohio six miles east of Cincinnati. It is skirted for the greater part of its course by the Little Miami railroad, connecting Xenia and Cincinnati.

Miami Indians, an American tribe of the Algonquian family, residing in Wisconsin, and first known to the French settlers in 1660. In 1700 they removed to Illinois, Indiana, and Ohio, and later separated into two distinct tribes Wea and Piankashaw. In the Colonial wars the Miamis figured with both combatants, but eventually joined Pontiac's alliance in 1764, opposing the Americans. After their defeat by Gen. Wayne they signed a treaty at Greenville in 1795. They again joined the British against the Americans in 1812, fighting under Tecumseh (q.v.). In 1827 they sold most of their lands and removed to Kansas. Disease killed off the majority of them, and the remnant of the tribe, numbering perhaps 50, now reside upon the Quapaw reservation in Indian Territory.

Miami University, in Oxford, Butler County, Ohio, is a coeducational institution. In 1788 J. C. Symmes purchased from the United States 1,000,000 acres of land, bounded south by the Ohio River, east by the Little Miami, and west by the Great Miami. One condition of this purchase was, that a full township, six miles square, should be set apart "for the endowment of an academy and other seminaries of learning." This condition was not complied with; but as the prospect of the establishment of a university within the bounds of Symmes' purchase had induced many to settle there, in 1803 Congress ceded to the State of Ohio the township of Oxford, to be held in trust for educational purposes. The university was incorporated in 1809. The lands are leased for 99 years (renewable forever, without re-valuation), subject to an annual quitrent of 6 per cent on the purchase money. The government is vested in a board of 18 trustees appointed by the governor of the State, six of whom retire every third year. A grammar school was established in 1818, and in November 1824 the college department proper was opened. The school has normal, preparatory, and college departments the courses leading to the degrees of B.A. and B.S. In 1910 there were connected with the institution 55 professors and instructors and 1,178 students. The grounds and buildings were valued at \$250,000, the productive fund was about \$52,000. There were over 19,000 volumes in the library. The State aid amounted to about \$23,000, and the total income from tuition, productive fund, and State was about \$265,000. The first class, consisting of 12 members, was graduated in 1826.

Miamisburg, mi-ám'z-bérg, Ohio, city, in Montgomery County; on the Miami River and the Miami & Erie Canal, and on the Cleveland, C. & St. L. and on the Cincinnati, H. & D. R.R.'s; about 45 miles north by east of Cincinnati. It is an agricultural region, and the good water-power has made it an important manufacturing place. It has large shipments of tobacco, manufactures, and cereals. One of the largest Indian mounds in the State is just outside the city. Pop. (1910) 4,271.

Mian'a-bug, a Persian tick of the genus *Argas*, greatly dreaded by travelers in former times, but its reputed powers of poisoning and otherwise harming humanity have been greatly exaggerated.

Miantonomoh, mi-án-tó-nó'mó, an American Indian chief, a sachem of the Narragansetts, who succeeded his uncle, Canonicus, in 1636. In 1637 he assisted the early settlers of Massachusetts in the Pequot war. In 1643 he attacked Uncas, his bitter rival, was captured and turned over to the commissioners of the United Colonies. He was placed on trial before an ecclesiastical court, found guilty, condemned to death, and Uncas was commissioned to carry out the sentence. A brother of Uncas, however, assassinated the captive before the sentence could be executed.

Mias'ma, or **Miasm** (Greek, "pollution"), a disease-producing emanation in the atmosphere, from decaying animal or vegetable material; malaria; malarial poison. Diseases at one time supposed to be thereby produced were classified as miasmata—such as intermittent and remittent fever, typhus, and typhoid fever. The term is used infrequently at the present day, as micro-organisms (bacteria-germs) are believed to be responsible for the spread of most of these diseases, and do not exist in the form of a miasm. While some of these organisms are carried by the atmosphere, and are inhaled, others are conveyed by insects to articles of food, and are taken into the body when such food is eaten. Others, still, are elaborated in a kind of mosquito (*Anopheles*) and injected into the blood. See INSECTS, PROPAGATION OF DISEASE BY; MALARIA.

Mica (Lat. *mico*, flash), a mineral group, marked by high basal cleavage, and laminae which may be made very thin by a process of continued separation. The micas are silicates; muscovite, the commonest, is a silicate of potassium and aluminum, and is often syled potassium mica; paragonite, or sodium mica, corresponds closely to muscovite, but has sodium instead of potassium; biotite, a silicate of magnesium, potassium and iron, is marked by its darker tints, and is commonly called magnesium iron mica; lepidolite is a lithium mica, with fluorine, potassium, and aluminum in its composition, and a rose tint. Mica is widely scattered in North America and Asia, especially India. Ruby colored mica, no matter what its provenance, is now called "Indian." Europe has no commercial supply. Deposits are most frequently found in pegmatite dikes, varying in thickness from a few inches to several hundred feet, and correspondingly in length. Many other minerals accompany it, especially quartz and feldspar, and the mica is scattered through the dike, or vein, as the miners call it. Moreover, scarcely more than 10 per cent, and sometimes as little as 2 per cent, is commercially useful. Mica was well known in prehistoric America, traces of its use being widespread. A great shaft near Mount Mitchell, in North Carolina, was discovered in 1869. This not merely solved the question as to the origin of the early supply, but gave the first impulse to the mining of mica in the United States. Mica lands in North Carolina became tremendously valuable. This boom was quickly followed by the development of the industry in southern New Hampshire; and this in turn by

MICA SCHIST—MICHAEL

important discoveries, in the 80's, in Canada and India. In Quebec, Ottawa, and Perth and Renfrew counties, Ontario, the supply is of excellent quality, and hence is easily mined and cheap. Hindu labor and an excellent grade of mica make the output of Bengal, Bombay, and the Madras presidency even cheaper. To classify the various sources of supply roughly, it may be said that India gives the world one half, and Canada and the United States each about one fourth of the entire supply. Everywhere the "veins" start near the surface; hence mining is simple. In New Hampshire there has been a break from the primitive methods, but in North Carolina, apparently the richest field in the United States, the mining is still unorganized, being done almost entirely by farmers, with the simplest of tools, between crops. In this region, mica is largely used as a medium of exchange between farmers and storekeepers.

In 1870 mica waste was first utilized by Frederick Beck, who introduced the use of "mica-flour," or ground mica, as a coating for cheap wall-papers. Scrap-mica, formerly worthless, rose to \$17 a ton, and then gradually fell to \$6 or \$7. This branch of the business is confined to the United States. Since 1895 there has been a fresh and most important use for mica, namely, as an insulator. For this purpose the sheets are split very thin and glued to cloth, then wound into rings for armatures. As a result of this variation of the uses of mica, only the colorless sorts, notably muscovite, are largely used for lamp chimneys and stove doors. Mica is also valuable as a lubricant, as an absorbent of glycerin in making dynamite, and, in the case of the lithium silicates, such as lepidolite, in the manufacture of lithium salts.

Mica Schist, schist, a schistose rock, metamorphic in nature, containing mica and quartz. The origin of most of the mica schists is uncertain; the sericite variety seems to be the result of mountain-building forces acting upon igneous rocks; other sorts are almost as certainly due to the same force acting upon sedimentary rocks. Mica occurring in schist is usually muscovite, that is, the colorless sort; biotite, or dark mica, is less frequent. Various embedded minerals occur, notably garnets.

Micah, mī'ka, the sixth of the minor prophets, dwelt in Moresheth, a little town, once a dependency of the Philistian city of Gath, but by the conquests of Uzziah reduced with the whole of western Judah, including the city of Gath, to Hebrew domination. His main public work was accomplished during the reign of Hezekiah. He dwelt on the great international highway between Egypt and Assyria and was led to take a wide view of the political movements in Western Asia in their effect upon his own people. He lived in the 8th century B.C. and he witnessed the ending of the northern kingdom, and the invasion of Palestine by Sargon and Sennacherib. He witnessed also the corruption of morals which Hezekiah only partially corrected. His prophecy is directed against Samaria and Jerusalem, whose sufferings for their sins and irreligion he declares shall be greater than those of Babylon and the other Gentile cities. His style is pure and correct, his images bold, his denunciations full of strength and severity.

Micah Clarke, a novel by A. Conan Doyle, published 1888. It presents in the form of

fiction a graphic and vivid picture of the political condition in England during the western rebellion, when James, duke of Monmouth, aspired to the throne, and Englishmen were in arms against Englishmen.

Micawber, mī-kā'ber, Mr. Wilkins, a shiftless, unsuccessful optimist, always in trouble, but always sure "something will turn up," one of the secondary characters in Dickens' 'David Copperfield.' He is said to have been drawn after the novelist's father, and Mrs. Micawber, who has great faith in her husband, to have been patterned after Dickens' mother.

Michael, mī'kēl or mī'kā-ēl (Hebrew, "who is Godlike"), is spoken of in Daniel (x. 13, 21; xii. 1) as one of the "chief princes," and the "great prince." In Jude (verse 9) he is called the archangel who disputed with the devil about the body of Moses. In the Revelation (xii. 7) it is said "there was war in heaven: Michael and his angels fought against the dragon." From this expression it has been inferred that he was the chief of the celestial hierarchy. Milton calls him "of celestial armies prince," and "prince of angels," and attributes to him the command of the heavenly forces. He was ranked by Thomas Aquinas, followed by Dante, as the first of the seven archangels. In France especially churches dedicated to this saint are often built on the loftiest hill tops, to afford the warrior angel a vantage ground in warring against the evil "powers of the air" and driving off plague, drought and murrain.

Michael I., Rhangabe, or **Rhangabe**, Byzantine emperor: d. about 845. He succeeded Stauracius in 811 and after carrying on war with the Bulgarians was deposed in 813 by Leo V., an Armenian general in his service, and spent the rest of his life in a convent.

Michael II., Balbes (THE STAMMERER), Byzantine emperor: d. 829. He came of an obscure Phrygian family, but was ennobled by Leo V. The latter, however, suspecting Michael of conspiracy against him, ordered the Phrygian to be put to death. Michael saved himself by the assassination of Leo and became emperor in 820. During his reign Sicily and Crete were lost to the Western empire.

Michael III. (THE DRUNKARD), Byzantine emperor: d. 867. He was a grandson of Michael II., and in 842 succeeded his father, Theophilus, though his mother Theodora, continued regent till 856. With his uncle, Bardas, he made an expedition against the Bulgarians in 861 and converted the king of Bulgaria. In 866 he associated Basilus the Macedonian with himself in the government and was assassinated by him the next year.

Michael IV. (THE PAPILAGONIAN), Byzantine emperor: d. 1041. He received his surname from the place of his nativity, and became chamberlain to Zœe, wife of the Emperor Romanus III. On the death of Romanus in 1034 he became emperor and the husband of Zœe, who is presumed to have murdered Romanus because of her love for Michael.

Michael V., Calaphates (THE CALKER), Byzantine emperor. He was a nephew of Michael IV., whom he succeeded on the throne. His banishment of the Empress Zœe led to a revolt in Constantinople, in which he was overthrown and compelled to retire to a convent.

MICHAEL—MICHAUX

Michael VI. (THE WARRIOR), Byzantine emperor. He succeeded the Empress Theodora in 1056, but after the expiration of a year was deposed by Isaac Comnenus and spent the rest of his life in a convent. He was the last of the Macedonian dynasty.

Michael VII, Ducas, or Parapinaces, Byzantine emperor. He was the son of Constantine XI., and came to the throne in 1071. He was a weak monarch, the prey of unscrupulous favorites, and an insurrection in 1078 drove him from the throne and into a monastery.

Michael VIII, Palaeologus, Byzantine emperor: b. 1234; d. December 1282. After having commanded the French mercenaries employed by the emperor of Nicæa he became one of the guardians of the Emperor John Lascaris in 1259. The next year he was proclaimed joint emperor of Nicæa in 1260, and the next year after deposing his colleague Lascaris, became sole monarch. In the same year he wrested Constantinople from the Latins and was shortly afterward crowned emperor of the Byzantine empire. He made an unsuccessful attempt to effect the union of the Western and Eastern Churches.

Michael IX, Palaeologus, Byzantine emperor: d. 1320. He was the son of Andronicus II., with whom he was associated in the government after 1295, but died before his father.

Michael, czar of Russia. See ROMANOFF.

Michaelis, Johann David, yō'hān dā'vêd mē'hā-ā'līs, German biblical scholar: b. Halle, Prussia, 27 Feb. 1717; d. Göttingen 22 Aug. 1791. He studied at the University of Halle, traveled in Great Britain and Holland, became professor of philosophy at Göttingen in 1746, and professor of Oriental languages there in 1750. He was one of the editors (1753-70) of the 'Göttingen gelehrte Anzeigen,' and served for a time as librarian to the university. Modern biblical criticism in Germany sees in Michaelis one of its forerunners, whose works are of interest in the history of its development. They include his 'Hebräische Grammatik' (1778); 'Einleitung in die göttlichen Schriften des neuen Bundes'; 'Mosaisches Recht'; 'Moral' (1792-1823); 'Orientalische und exegetische Bibliothek' (1786-93). Consult his 'Lebensbeschreibung von ihm selbst abgefasst,' ed. by Hassencamp (1793), and his letters (1794-6).

Michaelius, mē-kā'lē-ōos, Jonas, first Dutch Reformed minister in America: b. in the north of Holland 1577; d. Holland after 1637. He studied at Leyden, had a country church in Holland from 1612 to 1616; was sent to San Salvador, Brazil, in 1624; was transferred thence to Guinea in 1626; and in 1628 went to Manhattan, where he organized a consistory after the Dutch Reformed government. His last years were spent in Holland. A letter written by him describes the condition of the New York Indians, urging work among the children; it is published in the New York Historical Society's 'Collections' (1880).

Michaelmas, mīk'el-mās, the feast of St. Michael and All Angels, 29 September. The festival was first appointed by Pope Felix III., 480. In the Greek Church it did not originate earlier than the 12th century. It was an old custom in England to mark the day by electing civil magistrates, perhaps in allusion to the anal-

ogy between the superintendence of magistrates and that of guardian angels, of whom St. Michael was reputed the prince. A more famous custom is that of eating roast goose, the origin of which has long exercised the wisdom of antiquaries. The traditional Michaelmas goose has been traced at least as far back as the 10th year of Edward IV.; and it is said that one of the strongest objections of the English commonalty to the reformation of the calendar was based on the confusion which would follow if Michaelmas day was not celebrated when stubble geese are in their highest perfection. There is an old proverb: 'If you eat goose on Michaelmas day, you will never want money all the year round.'

Michal, wife of King David and younger daughter of King Saul. After David was driven away from court, and his life saved by Michal, who favored his escape, her father married her to Phalti, from whom David eventually recovered her, but was permanently alienated from her by her levity and want of sympathy with his enthusiastic joy over the return of the ark to Jerusalem.

Michaud, mē-shō, John Stephen, American Roman Catholic bishop: b. Burlington, Vt., 24 Nov. 1843. He was graduated from Holy Cross College, Worcester, Mass., in 1870, and was ordained in the priesthood in 1873. He was consecrated bishop in 1892.

Michaud, Joseph François, zhō-zēf frān-swā, French historian: b. Albens, Savoy, 19 June 1767; d. Passy 30 Sept. 1839. He became a journalist at Paris, where he wrote for Royalist papers, and stoutly upheld the monarchy; and in 1794 established the 'Quotidienne.' His opposition to the Revolution brought upon him sentence of death (27 Oct. 1795), and though the sentence was later revoked, he was finally exiled by the Directory, and went into hiding in the Juras. He was allowed to return under the consulate, but remained an apologist of the Bourbons, and at the Restoration took up the publication of the 'Quotidienne.' The well-known 'Biographie Universelle' was published under his direction. Among his more important works are: 'Histoire de l'Empire de Mysore' (1801); 'Histoire de Croisades' (1812-22); and 'Collection de Mémoires pour Servir à l'Histoire de France depuis le XIII^e Siècle' (1836-9).

Michaux, André, ān-drā mē-shō, French botanist: b. Satory, Versailles, 7 March 1746; d. Madagascar 16 Nov. 1802. His father, a rich farmer, took him into partnership, but the death of his wife soon after their marriage drove him to the study of botany and to travel. He traveled through France and England in 1779-81; then through Persia and to the borders of Tibet (1782-5); and in 1785 to North America, where he made an exhaustive study of the flora of the Atlantic coast, and near Charleston, S. C., and in Bergen County, N. J., established large nurseries. In 1800 he set out on a trip to Australia, but died in Madagascar. He wrote a 'History of the Oaks of North America' (1801) and 'Flora Boreali-Americana' (1803).

Michaux, François André, French botanist, son of André Michaux (q.v.): b. Versailles 1770; d. Vauréal 23 Oct. 1855. He was his father's assistant, and in 1802 and 1806 was sent to North America by the French government.

He wrote a 'Journal' of his travels, translated into English (1805); 'The Naturalization of American Forest Trees' (1805); and the important 'North American Sylva,' translated by Hillhouse (1817-19) and completed, for western America, by Nuttall (1842-50).

Michel, François Emile, frān-awā i-mēl mē-shēl, French painter and art critic: b. Metz 1828. After studying under Migette and Maréchal, he made his debut in the Salon in 1853, since which he has produced 'Summer Nights' (1872); 'Sowing in Autumn' (1873); 'The Harlem Sound' (1885); the two latter being now in the Luxembourg. He was elected to the Institute in 1892. Among his works are: 'Rembrandt' (1886); 'Hobbema et les Paysagistes de son Temps en Holland' (1840); 'Jacob van Ruysdael et les Paysagistes de l'Ecole de Haarlem' (1890).

Michel, Louise, French anarchist: b. Vroncourt, Upper Marne, France, 29 May 1830; d. Paris, 9 Jan. 1905. When very young she wrote verses of unusual power and in 1860 opened a school in Paris. During the government of the Commune in 1871 she worked zealously in its behalf, was made prisoner, sentenced to deportation for life, but was pardoned by the amnesty of 1880 and returned to Paris where she edited 'La Révolution sociale' and continued her anarchistic teachings. She was imprisoned in 1883 and in 1886, and later made her home in London, where she continued her work. She published: 'Le Coq Rouge'; 'Les Méprisées'; 'Ses Mémoires'; 'L'Ere Nouvelle'.

Michelangelo Buonarroti, mī-kēl-ān'jē-lō or **mē-kēl-ān'jē-lō, boo-ō-nār-rō'tē,** whose name during his lifetime was written as **Michelagnolo** (or **Michelangiolo**) **di Ludovico di Buonarroti-Simone;** Italian sculptor, painter and architect: b. Caprese, Tuscany, 6 March 1475; d. Rome 18 Feb. 1564. The family was well established as a family of citizens in Florence; but had been allowed heraldic bearings, a custom not unusual in relation to the controlling families of the Italian cities.

At a very early age Michelangelo became a student of fine art, entering first the workshop of Domenico Bigordi, called Ghirlandajo, and studying also in a primitive kind of art school which had been formed in the palace and gardens of Lorenzo dei Medici. It appears that the extraordinary abilities of the boy were noticed by his patrons and also by the artists of the epoch from the first. Michelangelo thought of himself only as a sculptor, and he put his energies into the study of bas-relief and statuary; studying the remains of Græco-Roman antiquity, which were accessible, and producing works of such importance as caused surprise to his contemporaries, although most of these very early works are either lost altogether or are uncertain — pieces which are usually ascribed to this epoch not having certain ascriptions. The earliest very important work which has remained to us is the *Pietà*, which is now in a chapel of St. Peter's Church at Rome. The figures are slightly larger than life, the Madonna holding the body of Christ on her lap in a not unusual attitude; a belt passing over the left shoulder of the Virgin is inscribed with the name of Michelangelo the Florentine, which is for years the only case in which Michelangelo signed a piece with his name. The famous group of the

Madonna and Child in the Church of Notre Dame at Bruges, in Belgium, is generally accepted as the work of Michelangelo, and if so, was of this early epoch. The reason for its transportation to Bruges is disputed. An entirely authentic piece of the time is a colossal David, which having been for three centuries in the open air at the portal of the Palazzo Vecchio at Florence, is now under shelter in the Accademia in the same city. This extraordinary work is a frank attempt to render the as yet imperfectly developed form of a very young man.

The only portable painting which can with certainty be ascribed to Michelangelo belongs to the closing years of the 15th century, when Michelangelo was approaching the age of 25 years. This is the circular picture, a Madonna with the Child and St. Joseph, in the Uffizi Gallery. The fact of his producing this and several other small works of painting, is not to be counted against his accepted position as a sculptor; for most of the artists of the time practised in the different arts, and it is probable that Michelangelo was at this time much less in the habit of painting than were other sculptors of well known ability. His own continual occupation upon works of pure form in marble was a sufficient reason for his continued abstention from the sister arts.

With the election of Pope Julius II. began the Roman life of Michelangelo, for he was called upon by the new Pope in 1505 to build a great monument which the Pope desired to finish within his own life-time. This monument was never completed, however, and the controversies and other difficulties which arose continually with regard to it, embittered a large part of the great artist's life and consumed time which could but ill be spared from actual work. The great statue of Moses, which was executed at a somewhat later time (not to be exactly fixed), was the only very important piece of statuary completed for this tomb.

In 1506 Michelangelo returned to Florence, and at that time there was a decided pause in the work upon the tomb, as other thoughts had taken up the mind of the Pope. Indeed, his return to Rome was followed immediately by the commencement of the painting upon the vault of the Sistine Chapel. This work as we have it is much the most important piece of mural painting of the modern world, for it occupies the whole vaulted room, 133 feet long and 45 feet wide, and is one continuous and unbroken composition containing hundreds of figures, life-size, of heroic size, and colossal, and done in pure fresco, except as it has been retouched in places either by the artist himself or in later times, in what is called dry fresco — that is to say, the colors laid upon the dry plaster. There is this marked characteristic of the painting — that it has no landscape backgrounds except in the small compartments devoted to The Deluge and The Temptation, nor any other accessories as of costume, arms, buildings and the like; but is everywhere a simple architectural composition of painted pedestals and corbels seeming to carry figures which themselves are painted in the most abstract way — studies of the human form simply dressed and having no artistic interest other than that. It has generally been considered that the paintings draw their only importance from the astonish-

MICHAEL ANGELO.

MOSES.

ing power of the draughtsmanship and the great composition of abstract lines; but a more careful consideration of what they were before their partial defacement by the smoke of candles and the injuries and repairs which they have received, shows that the work is one of interest as to color composition as well. Michelangelo has never shown himself to be a colorist in the sense in which Correggio and the great Venetians were colorists, but then the medium in which he painted was fresco, that is, painting upon wet plaster, which does not lend itself to elaborate combinations of warm and profuse coloring—its tendency is always toward pale combinations and the expression of delicately modulated form rather than of chromatic splendor. It is not, however, intelligent criticism to say that these paintings are the work of a sculptor taken rudely from the practice of his own art. On the other hand, it is quite unreasonable to say, as some English critics have said, that the turning of Michelangelo to sculpture had been unfortunate, as depriving us of the greatest of Christian religious painters while giving us only a melo-dramatic sculptor. The truth is that this artist is the most perfect exemplar of that way of treating all fine art, of which form alone (pure and abstract and almost separated from its usual purpose, as that of description and narrative), is the subject studied and gives the effect sought. Everything else—truth of anatomy, expression of face, energy of pose and of apparent movement—is subordinated to the one important thing—the getting of form which would be splendid in the artist's eyes. If, then, we have to regret a frequent excessiveness and extravagance of design, it can only be said that the extraordinary energy and force of the man, driving him on to undertake more than mortal man could achieve even had he been (as Michelangelo was not), left to pursue his own course in peace, resulted as of necessity in frequent exaggeration in the very desire to give vigor and as yet untried combinations of form as shown in the human body posed singly or in elaborate groups.

After 1513, when Julius II. died, Michelangelo undertook a façade for the Church of St. Lorenzo in Florence. This front was never finished; but not long after he began the building of a new sacristy for this church, in which square room, very finely adorned with classical architectural forms, are the two remarkable tombs of the princes Lorenzo and Giuliano dei Medici. These monuments have each a seated statue of the prince in question, raised high above the sarcophagus, and on the lid of the sarcophagus two colossal reclining figures, in each case one man and one woman. The sculptures are not all completed. The extraordinary power of their modeling has made these monuments very famous in the modern world.

About 1535 Michelangelo settled finally in Rome, and from that time until his death was very much occupied as an architect in connection with the great Church of St. Peter. The building had been going on for many years, and different architects had successively changed the design, so that Michelangelo took up the work at that point where it became necessary to roof the central mass. This he did by means of the famous cupola which dominates the city of Rome and the country around, although the rounded shell of stone itself was not erected during his lifetime.

As an architect Michelangelo was not, on the whole, beneficial to Italy or to the art of the 16th century, because he had never, as a youth, studied construction or the use of details, and because his almost exclusive devotion to more elaborate and organic forms than those possible to architectural masses, prevented his designing such features as frontons and consols with gravity and simplicity. The architecture inspired by him, and more especially that produced by his immediate successors, ran to extravagance; and the worst period of Italian decorative art was to follow upon his own epoch of work. The sculpture of his later years is much less important and much less in quantity than might have been expected; but the work upon the church occupied his energies, and in 1535 he was appointed by Pope Paul III., architect, sculptor and painter to the papal palace, and he began work immediately upon the east wall of the Sistine Chapel. Here he painted that prodigious Last Judgment, filling all the wall above the altar, including the lunette, and up to the nearly semicircular vault. The picture is, like the ceiling paintings, entirely a study of the human body in vigorous action, and in highly studied pose. As a work of color, or even of light and shade, it is almost unrecognizable for what it was, as the smoke of the candles on the altar has caused very great changes in color, and has led to repainting, and because of certain painted additions made in the next century in order to disguise the complete nudity of the figures.

Throughout his life Michelangelo had been a writer of verse, and it is known that important sonnets of his were left by him. These, however, were edited in a destructive manner by his nephew, so much so that we have at the present day no certain knowledge, even, of what the poems were as they left Michelangelo's hand. This part of his intellectual life has been treated with great thoroughness by John Addington Symonds in his life of the artist. The frescoes of the Sistine Chapel have been peculiarly the study of Heath Wilson who, about the middle of the 19th century, had a scaffolding erected in the chapel and studied the paintings inch by inch; and who recorded his observations in a valuable book. Apart from these two books and the life by Harford, the best book on Michelangelo is the volume of the *Gazette de Beaux-Arts*, published in 1876. This volume contains papers by the sculptor, Eugène Guillaume, the architect, Charles Garnier, and the competent writers, Charles Blanc, Paul Mantz, A. Mézières, and Anatole de Montaiglon.

RUSSELL STURGEON.

Michelet, Jules, zshil mēsh-lā, French historian: b. Paris 21 Aug. 1798; d. Hyères 9 Feb. 1874. He was educated at the Lycée Charlemagne and in 1821 became a professor there. After the revolution of 1830 he was appointed chief of the historical section in the Archives, and in 1838 professor of history at the Collège de France. He lost his offices by his refusal to take the oath of allegiance to Louis Napoleon, and thereafter devoted himself to his busy literary labors. His *Histoire de France* (18 vols. 1833-67; new ed. 19 vols. 1879) is among the monumental productions of historical composition, and definitely established his fame. His *Histoire de la Révolution* (1847-53; new ed.

1809) is a splendid specimen of eloquent writing, but hardly a great history. In all his historical writing Michelet has been criticized for unduly subordinating historical values to dramatic effect. But his descriptions are remarkably vivid, and his rendering of certain episodes is unsurpassed. Among his further writings are: 'Précis de l'Histoire Moderne' (1827); 'Histoire Romaine' (1831), and several volumes of polemics and of natural philosophy.

Michelet, Karl Ludwig, kārī lood'vīg mē-shē-lā, German philosopher: b. Berlin 4 Dec. 1801; d. 16 Dec. 1893. He was graduated from the University of Berlin in 1824, and in 1828 was appointed to the professorship of philology and philosophy in the French gymnasium, which he held for 25 years. In 1829 he also became professor of philosophy in the University of Berlin. He devoted himself especially to the doctrines of Aristotle, and published 'Die Ethik des Aristoteles' (1827), an edition of the Nicomachean ethics with Latin commentary (1829-33), and a memoir entitled 'Examen Critique du Livre d'Aristotele, intitulé Métaphysique' (1836), which was crowned by the Academy of Moral and Political Sciences. From 1832 to 1842 he was engaged as one of the editors of Hegel's works, in illustration of whose system he wrote 'Geschichte der letzten Systeme der Philosophie in Deutschland von Kant bis Hegel' (1837-8); 'Entwicklungsgeschichte der neuesten Deutschen Philosophie mit besonderer Rücksicht auf den gegenwärtigen Kampf Schellings mit der Hegelschen Schule' (1843); and a controversial dissertation, 'Schelling und Hegel' (1850). His own standpoint and tendency are most decisively shown in his 'Vorlesungen über die Persönlichkeit Gottes und die Unsterblichkeit der Seele, oder die ewige Persönlichkeit des Geistes' (1841); and 'Die Epiphanie der ewigen Persönlichkeit des Geistes' (1844-52).

Michelson, Albert Abraham, American physicist: b. Strelno, Posen, Germany, 19 Dec. 1852. He came to the United States when a boy; was graduated at the U. S. Naval Academy in 1873; took graduate courses in physics in Berlin and Heidelberg, and in Paris at the Collège de France and the Ecole Polytechnique, between 1880 and 1882; and in the meantime had resigned from the navy to become professor of physics at the Case School of Applied Science, Cleveland, Ohio. From 1880 to 1892 he was professor of physics at Clark University, and since 1892 has been head of the department of physics in the University of Chicago. He is a member of many scientific societies and a contributor to scientific periodicals. His experiments at the Naval Academy in 1879 and at Cleveland in 1882 gave new figures for the velocity of light in *vacuo*. He made careful studies of the relative motion of ether and matter, and apparently proved that, though in general ether may have relative motion, within building walls, etc., it partakes of the motion of materials. About the same date (1886-7) his inferential refractometer made it possible to use wave-lengths of light as a measuring unit; this discovery was put to concrete use by his measuring a metre in terms of cadmium light wave-length; this was done for the Paris International Bureau of Weights and Measures, with the result that the metre is no longer an arbitrary unit, since the original metre-bar so carefully preserved in Paris, could

easily be replaced at any time now that its length is known in terms of other units. This interferometer not only determines wave-lengths of red, green, and blue cadmium light, but separates lines less than one thousandth metre apart, and hence is a very delicate dividing machine. The echelon spectroscope, an arrangement of glass plates of equal thickness, but of surface area varying in arithmetical progression, was invented by Michelson in 1898; it is valuable for the study of the Zeeman effect. In 1907 he was awarded the Nobel prize in physics.

Michigan, one of the United States, admitted into the Union 26 Jan. 1837. It lies in the region of the Great Lakes, between lat. 41° 42' and 47° 32' N., and lon. 82° 24' and 90° 31' W. The State is divided into 83 counties. The capital is Lansing and the total population in 1910 was 2,810,173. (See *Population*.) The State has an area of 58,900 square miles including 1,470 square miles of water and 57,430 of land. It has a length of 305 miles from north to south and an average width of 200 miles. The State is practically surrounded by lakes and rivers; and is bounded on the north by Lake Superior; on the south by Indiana and Ohio; on the east by Lake Erie, Detroit Strait and River, Lake Saint Clair, Saint Clair River, Lake Huron and Saint Mary's River; on the west by Wisconsin and Lake Michigan.

Topography.—Michigan is sometimes called the Peninsular State, from its formation in two great peninsulas, the upper and the lower. The former has an extreme length east and west of 288 miles and a width of 164 miles; the latter has a length north and south of 277 miles and a width of 107 miles. The upper or northern peninsula has enormous mineral wealth, and the soil of large portions of it is well adapted to the production of potatoes, rye, buckwheat and clover. The highest point in the State is a group of hills known as Porcupine Mountains, in the northwest part near Lake Superior. These mountains are 1,830 feet above the sea. From Keweenaw Point the famous mineral range extends westward into Wisconsin. These mountains form the watershed between the streams flowing into Lake Superior and Lake Michigan. The surface of the Lower Peninsula is generally level, broken in the southern portion by conical hills rising to an altitude not exceeding 200 feet. It is divided by a low undulating watershed running north and south, and rising at its highest point in the north about 800 feet above the lake surface, the larger portion of the State being on the west of this and gradually sloping toward Lake Michigan. The soil is of a varied composition and in large areas is very fertile, especially in the south. Among the 200 islands within the State boundaries are Isle Royale and Grande Isle in Lake Superior; Sugar Island, Encampment Island, Drummond Island, Bois Blanc and Mackinac in Lake Huron; and Beaver, Fox, and Manitou in Lake Michigan.

Climate.—In a State covering so wide a range of latitude, climatic conditions necessarily show large variations. The mean annual temperature varies from 40.4° in the Upper Peninsula to 46.9° in the southern part of the Lower Peninsula. The mean average temperature in July and August is 64.2° in the first named region, and

MICHIGAN

71.6° in the latter. In January and February, the mean average varies from 14.3° to 23.5°. The annual rainfall averages 28 inches. Owing to the proximity of the lakes, the climate of the southern peninsula is milder in winter and cooler in summer than in other parts of the country in the same latitude. In the northern part of the Lower Peninsula many attractive summer resorts have developed along the lake coast. At other places popular resorts have built up on account of the medicinal value of mineral springs, chief among these being Mount Clemens; while the waters of four mineral springs find a market.

Rivers and Lakes.—Along the lake coasts are numerous bays and inlets. Keweenaw, White Fish and the Big and Little Noyette bays are the principal indentations on the north; while the Grand and Little Traverse, Thunder and Saginaw bays indent the southern peninsula. The rivers are small, short and shallow. The most important are the Grand, flowing into Lake Michigan; and the Saginaw, flowing into Lake Huron; each of which is navigable for about forty miles. Among the other rivers may be mentioned the Au Sable, Thunder Bay, and Cheboygan, flowing into Lake Huron; Ontonagon and Tequamenon into Lake Superior; and the Saint Joseph, Kalamazoo, and Escanaba into Lake Michigan. Lakes abound throughout the State, over 5,000 in all, and no less than 175 are in the basin of the Kalamazoo River. These lakes are valuable sources of water supply, which is abundant throughout the State. The largest lakes are Houghton, Mulletts, and Burts, in the northern part of the Lower Peninsula; and Manistique in the Upper Peninsula.

Geology.—The geology of the State represents every series known from the oldest strata to the carboniferous. Primary boulders are found over the entire surface, the northern part being principally of primitive origin, while Secondary deposits cover the entire southern peninsula. The Upper Peninsula exhibits Lower Silurian sandstones, limestones, copper and iron bearing rocks, corresponding to the Huronian system of Canada. The Mineral Range of Mountains is of eruptive or volcanic rock, with older strata tilted upon its side. Farther eastward are the long belts of the Lower Silurian, curving from Green Bay through the Saint Mary's Peninsula. The central portion of the southern peninsula contains coal measures and rocks of the permo-Carboniferous period. The coal-bearing area of about 5,000 square miles is in the neighborhood of Saginaw; but the coal is for the most part of inferior quality. The surface of the State is largely determined by glacial action, being covered with a sheet of till, in some places some hundreds of feet in thickness. The rivers are upon the drift surface.

Minerals.—Michigan possesses vast mineral wealth, especially in the copper and iron mines of the Upper Peninsula. The Calumet and Hecla and other famous copper mines are on Keweenaw peninsula; and furnish copper of a quality nowhere surpassed, and for some purposes unequalled. Until recently Michigan had the largest output of copper of any State, and still holds third rank, the product of 1909 being 227,005.923 pounds. In iron ore Michigan was also first among the States, until within a few years, when Minnesota has taken first place by a small margin. In 1908 the Michigan output was 8,839,199 tons,

valued at \$25,150,861. Some gold is found in the Upper Peninsula, and silver and lead in small amounts. In the Lower Peninsula the most important mineral product is salt, found in large quantities in the Saginaw Valley. The output is over 7,500,000 barrels from 250 wells, valued at \$2,500,000, the largest amount from any State and one third of the total for the United States. In the same region (Bay and Saginaw counties) coal mining has been developed on a considerable scale, mainly since 1898. In 1910 this industry was in better condition than in most States. Brick, tile and other clay products are made easily and cheaply in many parts of the State, the total value of such products for 1908 being \$1,728,790. Within recent years the manufacture of Portland cement has been developed on a large scale; and in 1901 there were ten works with a total product of 2,892,576 barrels, valued at \$2,556,215. Building stone is found in many parts of the State; and in the Upper Peninsula this includes marble and other ornamental stone, such as agates, jasper, chalcedony, and chlorastrolites. As yet, however, a comparatively small amount is marketed, the total value of the annual output being \$800,000, mostly in sandstone and limestone. Large deposits of gypsum are found in the Lower Peninsula near Grand Rapids. The annual output is 130,000 tons; and 20,000 tons of land plaster and 205,000 barrels of stucco are annually produced. Glass sand is found in the extreme southeast of the State; on the shores of Lake Huron grindstones are quarried; while still other minerals exist in less important quantities in various parts of the State.

Forests.—One of the most important sources of wealth and material prosperity to Michigan has been its abundant forests. Originally the Upper Peninsula and the northern half of the Lower Peninsula were covered with dense forests of conifers, consisting mainly of white pine. Farther south, hard woods were intermingled in larger proportion; while the southern part was mostly prairie. Besides white pine, the principal trees include basswood, maple, elm, sassafras, butternut, walnut, poplar, hickory, oak, willow, birch, beech, hemlock, witch-hazel, tamarack, cedar, locust, dogwood, and ash. The total forest area of the State, including stump land, is estimated at 38,000 square miles, or two thirds of the total area. Until after 1860 the production of lumber was relatively small; but by 1870 Michigan had gained first place as a lumber State, and maintained that position until 1900, when owing to the partial exhaustion of her resources she fell slightly behind Wisconsin. Michigan is, however, still the second State in lumber production. The development of this industry is shown in the following table:

Year	Establishments	Capital	Average number of wage earners	Wages	Value of products
1850	\$2,464,399
1860	7,042,190
1870	1571	\$26,990,439	20,058	\$6,400,283	31,046,396
1880	1849	39,260,428	24,231	6,967,905	37,449,928
1890	2124	120,467,272	34,308	15,548,233	63,121,060
1900	1705	67,379,698	26,199	11,122,030	54,390,550

MICHIGAN

In 1900, the total cut of lumber was 3,462,152,000 feet. The standing merchantable timber owned by lumber establishments was estimated to be 14,546,100,000 feet, which represents probably half the timber then remaining in the State. The lumber products have also been of great service in developing other industries in the State, notably the manufacture of furniture, which centres at Grand Rapids.

Agriculture.—This is the chief industry in Michigan. One third of the industrial population is engaged in agricultural pursuits; and the value of farm property is more than double the capital of manufacturing establishments, and nearly one half of the total assessed valuation of all property in the State. The development of farming may be seen in the following table:

YEAR	Number of farms	Acres in farms	Value of farm property	Value of farm products
1860	62,422	7,030,834	\$190,371,098	
1870	98,786	10,019,142	\$61,762,426	
1880	134,008	13,807,240	\$74,242,654	\$ 91,159,858
1890	172,344	14,785,098	\$47,938,255	\$3,651,390
1900	203,261	17,561,098	\$90,355,734	\$40,547,681
1910	206,376	18,913,000	\$946,828,000	

*Land, buildings, implements, and machinery.

The farm lands amount to exactly 51.5 per cent of the total area; and of this acreage 68 per cent is improved land. Most of the farming is in the Lower Peninsula. More than four fifths of the farms are cultivated by the owners; less than 5 per cent are operated by cash tenants, and but 11 per cent by share tenants. Cereals constitute the most important farm crops, contributing about 45 per cent of the total value of crops. Corn is the leading crop, wheat ranks next in value, and oats third. Hay and forage yield nearly one fourth of the total value of farm crops. Vegetables are raised in large quantities; and the State leads in the pro-

	Acres	Quantities	Value
Corn	1,501,189	44,584,130 bu.	\$17,798,011
Wheat	1,025,769	20,535,140 bu.	12,921,925
Oats	1,019,438	30,338,135 bu.	9,264,385
Rye	174,096	2,130,870 bu.	1,033,416
Barley	44,965	1,165,288 bu.	404,994

Orchard fruits	339,309		3,675,845
Small fruits	20,197		1,680,249
Grapes	10,465		503,268
Flowers and nursery products	2,124		899,231
Total, all crops	8,091,791		\$92,625,715

duction of beans, peas, celery, chicory, and peppermint; is third in potatoes, having gained in ten years. Fruit raising is a rapidly growing industry, especially in the southwestern part of the State, on the shores of Lake Michigan.

Apples and peaches are the principal orchard products; but there are also large quantities of pears and plums, as well as a considerable amount of grapes. In small fruits, Michigan ranks second among the States for its crop of strawberries, blackberries, currants, and raspberries. The leading crops in Michigan for the year 1910 were as in the preceding table, with the addition of alfalfa and emmer.

Live Stock.—The live stock interests are extensive and steadily increasing. Horses and

	Number	Value
Horses	586,539	\$35,907
Dairy cows	563,905	17,281,805
Other neat cattle	812,503	10,883,451
Sheep	1,625,930	5,227,343
Lambs	1,121,679	1,935,321
Swine	1,165,200	4,585,898
Fowls	8,403,060	2,685,829
All live stock		\$79,042,644
Wool	12,202,844 lbs.	\$12,202,844
Milk	300,617,040 gals.	
Butter	60,051,998 lbs.	16,903,087
Cheese	331,176 lbs.	
Eggs	54,318,410 doz.	6,104,462
Poultry raised		4,551,945
Animals sold and slaughtered		23,677,642
All animal products		\$33,921,966

dairy cows are the most important animals; and there are large numbers of other neat cattle, sheep, and swine. In the production of milk in 1910 Michigan has declined from fourth to seventh place, but the State stands very high in the output of butter and eggs. In the production of wool, Michigan ranks second only to Ohio among the States east of the Mississippi. Statistics of live stock and animal products at the 12th census are given in the preceding table.

Manufactures.—While Michigan is not one of the most important States in the extent of its manufacturing industries, there has been a large growth in this direction during the last half century, and the State ranks tenth in the Union in the value of its manufactured products. The development is shown in the first table on following page.

The industrial development of the State has been marked by a steady diversification of its manufactures. The earliest, and for some time the only, industry of importance was the manufacture of lumber and timber products, and this still remains an important manufacturing industry. The manufacture of automobiles, including bodies and parts, now leads, with an increase of over 1000 per cent in ten years. The valuation of production in 1909 was nearly \$100,000,000. The manufacture of furniture shows a large increase during the last decade; and Michigan ranks second among the States in this branch, as it does also in planing mill products. Second in importance among the groups of industries are those manufacturing food and kindred products, flour and grist mill products forming the principal branch of this group. The State ranks second, but second by a very clear margin (the first being California), in the production of beet sugar; and cereal and breakfast foods are manufactured in large quan-

THE STATE CAPITOL AT LANSING.

MICHIGAN

	Number of establishments	Capital	Wage earners	Total wages	Cost of materials	Value of products
1850	2,123	\$6,863,660	9,344	\$2,717,124	\$6,136,328	\$11,169,002
1860	3,448	23,808,226	23,190	6,735,047	17,035,611	32,658,356

1900	16,807	284,097,133	169,353	66,467,867	199,559,908	336,944,082
1909	9,139	583,947,000	262,111	153,838,000	368,612,000	685,100,000

ties. Other industries of importance are iron and steel, other metals, car shops, chemicals and leather products. The table below gives statistics in reference to the leading groups of industries for the year 1909:

	Number of establishments	Wage earners	Value of products
Lumber products, including furniture.....	2,382	52,237	\$90,155,244
Automobiles.....	113	25,444	96,651,451
Foundry and machine shops.....	654	21,649	45,399,023
Flour and gristmill products.....	520	1,530	34,860,803
Printing and publishing.....	1,045	7,219	12,413,815
Stoves and furnaces.....	33	4,482	9,122,873

There has been a moderate localization of manufacturing in the southern half of the Lower Peninsula. Detroit, located conveniently for lake navigation at the point of union between the railroads of the United States and Canada, is the largest manufacturing centre in the State; and leads especially in the manufacture of stoves, pharmaceutical chemicals, and tobacco. Grand Rapids is conspicuous as one of the great furniture centres of the world. Battle Creek is noted for its breakfast foods. Shipbuilding is carried on at Port Huron, Detroit, and Wyandotte. At Belding there are important silk interests.

Commerce.—Michigan has four ports of entry, Detroit, Port Huron, Grand Haven, and Marquette; and its proximity to Canada would make these important centres of foreign trade under favorable conditions. But under existing tariff laws the volume of foreign commerce is comparatively small. For the fiscal year ending 30 June the total exports from these ports is about \$30,000,000, and the total imports about \$7,500,000. The internal and interstate commerce of the State is of vast and growing importance, especially the traffic on the Great Lakes. Lake commerce has been greatly promoted by improvements to navigation, and especially by the construction of ship canals at the falls of the Saint Mary's River, across the shallows at the head of Lake Saint Clair, and across the Keweenaw peninsula. The traffic through Saint Mary's Falls canal in a single year was 40,000,000 tons of freight, four times the volume of freight through the Suez Canal. The most important items in this traffic were iron ore, 23,966,724 tons; grain, 96,160,313 bushels; flour, 8,469,085 barrels; and coal, 4,309,899 tons. Arrivals and clearances of vessels at Detroit in a single year are about 5,000,000 tons.

Railroads.—The first railroads in Michigan were begun by the State government in 1836;

but these lines were sold in 1846 to private companies. There are about 8,500 miles of railroad in the State, extending to nearly every one of the 83 counties. The leading lines are the Michigan Central, the Lake Shore & Michigan Southern, the Chicago & Grand Trunk, and the Pere Marquette. The railroads of Michigan carry about 15,000,000 passengers, and 60,000,000 tons of freight; and their gross income is \$50,000,000. There are about 30 electric street railway companies in the State operating 2,000 miles of track. This includes local roads in most of the principal cities, and also interurban lines which have been extended rapidly within recent years. From Detroit it is possible to go by electric railway as far as Kalamazoo, Port Huron, or Bay City; while additional lines radiate from Grand Rapids and other cities.

Banking.—The first bank in Michigan was organized in Detroit in 1817. When the State was admitted to the Union in 1837 a period of wildcat banking ensued, which soon brought disaster. The State banks as well as the national banks are now on a sound basis; and the former are slightly more important than the latter, as is shown in the following table for 1909:

	No. of banks	Depositors	Savings Deposits
National banks.....	97	130,549	\$39,103,306.48
State banks.....	265	181,303	100,936,036.07
Savings banks.....	14	74,178	30,490,348.22
Private banks.....	102	19,059	3,905,944.26
Total.....	478	606,989	\$174,437,635.03

The exchanges for the year ending 30 Sept. 1909 at the clearing houses at Detroit and Grand Rapids amounted to \$849,058,700, an increase over the previous year of \$74,075,770. The State has also a large number of savings banks and trust companies.

Government.—Michigan has 12 representatives in the lower house of Congress, and two senators. It forms part of the sixth federal judicial circuit; and is divided into two federal judicial districts and two internal revenue districts. The State has about 2,500 post-offices, 10 of the first class. The State legislature consists of a Senate of 32 members and a House of Representatives of 100 members, the whole membership being elected biennially. The regular session of each legislature begins on the first Wednesday in January of odd numbered years. The compensation of members is \$3 per day and mileage. The governor is elected for a term of two years and receives a salary of \$5,000 a year. Re-elections for a second term are frequent.

MICHIGAN

Other State officers are elected for the same term; and various commissioners and members of boards are appointed by the governor and senate. The supreme court consists of five justices, elected one every second year for ten years, at the spring election in April, when also are elected the regents of the State University. There are 38 State judicial circuits, each with one or more circuit judges, elected for a term of six years. County government is organized on the same plan as in New York, with a board of supervisors elected by townships and city wards. Sheriffs and other county officers are elected, in most instances for a term of two years. Township organization is unimportant, owing to the large number of villages and cities. There are 312 incorporated villages and 82 cities. Most of the latter are governed by special charters with nothing approaching a uniform system of organization. Amendments to the constitution are adopted on passing each house of the legislature by a two thirds vote, and afterward receiving a majority of the popular vote on the proposed amendment. Every 16 years the question of the general revision of the constitution is submitted to the electors. All male citizens of the United States who have resided in the State for six months, and in the ward or township for 20 days, are entitled to vote.

State Finances.—The first State Legislature authorized a loan of \$5,000,000 for public improvements; and in 1861 there was still \$2,316,328 outstanding. During the Civil War this debt was increased to \$3,880,399; but was steadily decreased and practically extinguished by 1890. In 1898, a loan of \$500,000 was made on account of the war with Spain; but this debt has now been cleared up. For the year ending 30 June, 1911, the public revenue and expenditures were as follows:

Balance, 1 July, 1910.....	\$2,487,883
Receipts, 1910-11	12,344,494
Total	\$14,832,377
Disbursements 1910-11	12,596,952
Balance, July 1, 1911.....	\$2,235,425

The chief disbursements are for education, the maintenance of State institutions and the expenses of the State government.

The taxation levied by the different administrative districts is divided into the state tax, county taxes, township taxes, highway labor taxes, village taxes and city taxes, the latter being the largest single item; it is about twice the size of the township taxes and and two and one half times the amount of the state tax.

Since 1899, through the efforts of the State Tax Commission, the assessed valuation of property has been increased from \$968,189,087 to \$1,741,215,138 in 1910, of which \$1,349,041,990 was the valuation of realty property, and \$399,273,148 that of personal property. The tax-rate per \$1,000, in 1911, was \$2.85. There is no bonded debt.

Charities and Correction.—The State maintains five insane hospitals, at Kalamazoo (established 1848), Pontiac, Traverse City, Newberry, and Ionia, the last named for the criminal insane. These institutions hold property valued at

about \$4,000,000, the number of patients was 5,000, and the annual expense \$1,150,000. There is also a home for the feeble-minded and epileptic at Lapeer, and a Soldiers' Home at Grand Rapids. There is also a State school for the deaf and dumb at Flint, a school for the blind and an industrial school for boys at Lansing, an industrial home for girls at Adrian, and a school for neglected and dependent children at Coldwater, the last named the first of the kind in the United States. Correctional institutions consist of State prisons at Jackson and Marquette, and a reformatory at Ionia, with a total of about 1,500 inmates. The expenditures for a single year are \$245,000, and the receipts from prison industries \$138,000. The indeterminate sentence has recently been adopted in Michigan. Each of these institutions is under the management of a separate board of unpaid trustees. An unsalaried State Board of Charities and Correction, appointed by the governor and senate, inspects both State and local institutions.

Education.—There are 8,000 school districts, 20,000 teachers and 8,500 school buildings, the property aggregating \$25,000,000. Out of 712,544 children between 5 and 18 years of age, 529,352 were enrolled in the schools. There were 382 public high schools and 25 private schools. The total public school revenue is about \$8,800,000; and \$5,000,000 is paid in salaries to teachers and superintendents. Only 4 per cent of the population is classed as illiterate. The State maintains four normal schools, and three institutions for higher education,—the University of Michigan (q.v.) at Ann Arbor, the Agricultural College at Lansing, and the College of Mines at Houghton. There are nine private colleges in the State, at Adrian, Albion, Alma, Battle Creek, Detroit, Hillsdale, Holland (Hope College), Kalamazoo, and Olivet. Besides the State library at Lansing and the University library at Ann Arbor, there are large public libraries in Detroit, Grand Rapids, and other cities. The newspaper press is well developed. The first was established at Detroit in 1817; and there are now over 800 newspapers and periodicals, of which 80 are issued daily, 600 weekly and 85 monthly.

Churches.—The Roman Catholic Church has the largest number of communicants. Of the Protestant denominations, the Methodist Episcopal Church is first, and the Lutheran second; while the Baptist, Presbyterian, Congregational, and Protestant Episcopal follow in the order named; and the German Reformed, United Brethren, Disciples of Christ, and Adventists have also considerable numbers. There are about 5,000 church organizations, with 4,000 buildings and 575,000 members, and property valued at \$19,000,000.

History.—Some reminders of prehistoric races are to be found in Michigan in deserted copper mines at Isle Royale, and other signs of human occupation, assigned to the mound builders (q.v.). The Indians who occupied the region in historic times were mostly Hurons or Wyandots, who were in almost constant conflict with the Iroquois confederacy. The first white men who visited the Michigan country came from the French settlements in Canada by way of the Ottawa River, early in the 17th century. It is known that Jean Nicolet, vanguard of the

MICHIGAN

Jesuit missionaries, penetrated as far as central Wisconsin in 1634; and it is supposed that other explorers had come still earlier. The first permanent white settlements were Jesuit missions established by Father Marquette at Sault Ste. Marie and Michilimackinac in 1668 and 1670. A French colony was founded at Detroit in 1701 by Antoine de la Motte Cadillac (q.v.). During the French and Indian war, these settlements in Michigan were surrendered to the British (1760) as part of Canada. In 1763 the Indians rose under Chief Pontiac and after the massacre of Mackinaw laid siege to Detroit for nearly a year, but were finally defeated. The Quebec Act (q.v.) of 1774 for the government of Canada applied to Michigan. During the Revolution the British officers at Detroit encouraged Indian expeditions which harassed the settlements in Ohio and Kentucky; and even after the peace of 1783 there was much trouble with the Indians until 1795, when they were brought to terms by General Wayne. By the treaty of peace, they ceded large tracts of land in Michigan to the United States. It was not until 1 July 1796 that the British troops surrendered possession of Detroit to the United States. The Michigan settlements then came under the government of the Northwest Territory. In 1802 the country was made a part of Indiana Territory; and in 1805 the Lower Peninsula was organized as Michigan Territory, with General Hull as governor. During the War of 1812 Detroit and Frenchtown were surrendered to the British, and at the latter place many prisoners and inhabitants were massacred by the Indians (See FRENCHTOWN MASSACRE). After the battle of Lake Erie (1814) the United States again came into possession of Michigan; and Lewis Cass began his long career as governor of the territory, which continued until 1831. With the final abandonment of Michigan by the British, the Indians acknowledged American supremacy; and from 1814 to 1835 ceded large tracts of land to the United States. The completion of the Erie Canal across New York State in 1825 opened a new route to Michigan, and population increased rapidly. In 1837, after a bitter struggle over the southern boundary, Michigan was finally admitted to the Union, the Upper Peninsula being added to the State as compensation for the loss of the strip claimed from Ohio.

The new State at once undertook to build three lines of railroad across the Lower Peninsula; but the plans failed and in 1846 the roads were sold to private corporations. In 1847 the State capital was removed from Detroit to Lansing. A second State constitution was adopted in 1850. During the Civil War Michigan sent her full quota of troops to the front; and many of them became famous as soldiers and sailors. Austin Blair was governor during the war period. The State had prohibited the sale of liquor in 1855; but in 1876 the prohibition law was repealed, and a license tax substituted, which has since been raised to a high figure. In 1881 the United States ship canal around Saint Mary's Falls was completed, paving the way for the rapid development of the mining resources of the Upper Peninsula. In 1889 the Australian ballot was adopted. The question of a general revision of the State constitution was voted on in 1892, and again

in 1898; but on both occasions failed to secure the required vote. Many amendments to the constitution have, however, been adopted from time to time. In recent years the most important legislation has been that dealing with taxation, especially of corporations. In politics Michigan was Democratic with the exception of two elections until 1854; and it has been Republican since, with but three exceptions—in 1882 and 1883 fusion Democratic-Greenback tickets, and in 1890 the Democratic party were successful. Among the leading Michigan men in public life may be noted:—Lewis Cass, who after his long service as governor of the territory, filled positions in the cabinets of two Presidents, was senator for two terms (1845-57) and a candidate for President of the United States; Zachariah Chandler, senator for three terms (1857-75), and secretary of the interior; James V. Campbell, justice of the Supreme Court from 1858 until his death in 1890; and Thomas M. Cooley, justice of the Supreme Court from 1864 to 1885, and chairman of the Interstate Commerce Commission.

Population.—In 1810 the population of Michigan was 4,762; (1830) 31,639; (1840) 212,267; (1850) 397,654; (1870) 1,184,059; (1890) 2,003,890; (1900) 2,420,982; (1910) 2,810,173. The rapid settlement began after 1830; while since 1870 the increase has been at about the same rate as the United States as a whole, and during these 30 years Michigan has been the ninth State in population. The early settlers were largely from New York and New England. Since 1850 there has been a large immigration of foreigners, mostly Canadians and Germans; while there have also been considerable numbers from Holland, Ireland, and Poland. In 1900 the total foreign born population was 521,653, a larger proportion than in any other State in the Northwest Territory, except Wisconsin. Of those born in the United States 831,653 had one or both parents of foreign birth, leaving less than half (43 per cent) of the population born of native parents. Most of the population is in the Lower Peninsula; and only 261,362 (about one ninth) are in the Upper Peninsula. Urban population is about the same proportion in Michigan as in the United States as a whole; 60.7 per cent of the population live in the country districts, and 31 per cent in cities of over 8,000. The principal cities are Detroit, 285,704; Grand Rapids 112,571; Saginaw, 50,510; Bay City, 45,166; Jackson, 31,433; Kalamazoo, 30,437; Muskegon, 24,062; Port Huron, 18,863; Battle Creek, 25,267; Lansing, 31,229; and Ann Arbor, 14,817. Other cities of importance are Manistee, Ishpeming, Flint, Menominee, West Bay City, Sault Sainte Marie, and Marquette.

JOHN A. FAIRLIE,
University of Michigan.

MICHIGAN

Michigan, Lake, in the northern part of the United States, the second in size of the Great Lakes (q.v.), and the largest body of fresh water lying wholly within the United States. It is bounded on the north and east by the State of Michigan, on the south by Indiana, and on the west by Illinois and Wisconsin. Its outlet is Straits of Mackinac, through which its waters flow into Lake Huron (q.v.). The Mississippi is supposed to have been its outlet, in ancient times; and now the Lake is connected with this river by means of the Chicago Drainage Canal (q.v.) and the Illinois and Michigan Canal. Lake Michigan is a most important part of a great water system which furnishes transportation to the ocean for an extensive grain-growing and lumbering region. The Lake is 581 feet above sea level; its length from north to south is about 300 miles; the average width, 75 miles, the average depth 870 feet; area, 22,450 square miles. It is subject to violent storms, which are most destructive in the late autumn months. A lunar tidal wave shows itself in a slight degree. The shore-line of the southern part of the Lake, east and west, is regular, but that of the northern part, east and west, has a number of indentations many of which form good harbors. At the mouths of rivers which flow into the Lake there are good harbors. Nearly the whole extent of coast is low, most of it sandy; the Michigan coast has some high bluffs and considerable rocky shore-line. Green Bay on the west, indenting Wisconsin, is the largest bay, and Grand Travers Bay, on the east indenting the coast of Michigan is the next in size. Another important inlet on the east is Little Travers Bay. Big Noquet and Little Noquet are inlets from Green Bay. The chief harbors, which are formed by mouths of rivers, are Chicago, Milwaukee, and Grand Haven. Escanaba and several other good harbors are on the shores of Green Bay (q.v.). There are few islands in the southern part of the Lake, all small and near the coast. At the entrance to Green Bay there is a group of islands, the largest of which is Washington. The Manitowish (q.v.) group, in the northern and northeastern part of the Lake, has several good-sized islands; the largest, Beaver, is about 52 miles long.

The chief rivers which flow into the Lake are the Ford, Escanaba, and Manistique from the north; the Manistee, Pere Marquette, Muskegon, Grand, Kalamazoo, and St. Joseph from the east. The Fox and the Menominee enter the Lake through Green Bay.

The chief cities on the Lake are Chicago in Illinois, and Milwaukee in Wisconsin. Other important cities are Kenosha, Racine, and Manitowish (Wis.), Manistee, Ludington, and Grand Haven (Mich.), and Michigan City (Ind.). The navigation on Lake Michigan is most extensive and important. In the upper waters, or the southern part, navigation continues nearly all the year, but in the northern part navigation is closed about four months on account of the ice in the Straits of Mackinac. Large shipments of lumber are sent by way of the Lake from northern Michigan and Wisconsin to Milwaukee and Chicago, and a vast amount of the wheat and corn of the Mississippi Valley is sent east through Chicago and over Lake Michigan. The fisheries of the Lake are most important. The lake trout and whitefish of Lake Michigan are

sent, fresh and canned, to all the large markets of the vicinity and to the Eastern markets.

The early missionaries and traders traversed the waters of this Lake. In 1634, Jean Nicolet, an agent of Champlain (q.v.), visited the northern part of the Lake, entered Green Bay, and partially explored the Fox River. Father Marquette (q.v.) visited this Lake and established mission stations on its shores. La Salle (q.v.) and Father Hennepin (q.v.) in 1679 made their famous voyage on this Lake, and La Salle built a fort at the mouth of the St. Joseph River.

Michigan, University of, chartered in 1837, and first opened at Ann Arbor in 1841. It is a part of the public educational system of the State, and is under the control of a board of regents, elected for eight years by popular vote. The law of 1837 establishing the University provided for three departments, namely, Literature, Science and Art, Law and Medicine. The curriculum has since been enlarged, till the organization now includes seven departments: (1) Literature, Science and Arts; (2) Engineering; (3) Medicine and Surgery; (4) Law; (5) The School of Pharmacy; (6) The Homœopathic Medical College, and (7) The College of Dental Surgery. The Department of Literature, Science and Art offers courses in language and literature, history, philosophy, science, and the liberal arts, and includes a graduate school; the degrees conferred are bachelor of arts, master of arts, doctor of philosophy, and doctor of science. The Department of Engineering offers courses in civil, chemical, mechanical, electrical, and marine engineering, and confers the degrees of bachelor of science, master of science, and civil engineer, mechanical engineer, and electrical engineer. Other degrees conferred by the University are as follows: Doctor of medicine in the Department of Medicine and Surgery, and in the Homœopathic Medical College; bachelor of laws and master of laws in the Department of Law; pharmaceutical chemist, also bachelor of science and master of science (in pharmacy), in the College of Pharmacy; and doctor of dental surgery and doctor of dental science in the College of Dental Surgery.

There are summer sessions in the departments of Literature, Science and Art, of Medicine, and of Law.

The regulation of the affairs of each department is in the hands of the faculty of that department; there is also a University Senate which considers matters of common interest. The standard of scholarship at the University is high, and it has long ranked among the foremost of State universities. It is distinguished as a pioneer in adopting the principle of co-education, being opened to women in 1870, and giving them equal privileges in all respects; this system has proved very successful since the first, and has never incurred serious adverse criticism. The dormitory system adopted at first was discarded early in the history of the institution, and the University now has no dormitories and no commons. Besides the halls and laboratories of the different departments, the important buildings are the library, the museum, the main observatory, and the two gymnasiums, one for men, and one for women. The University has a number of valuable collections in natural history, archaeology, ethnology, materia medica, anatomy, and the industrial and fine arts; in the library build-

MICHIGAN CITY—MICHIOACAN

ing is the Chinese government exhibit at the New Orleans Exposition, presented to the University in 1885. The general library in 1903 numbered over 130,000 volumes, not including pamphlets; special libraries also belonging to the University are the medical library (12,000 volumes), the law library (19,600 volumes), the homeopathic library, and the dental library; of these, the two medical libraries are shelved in the general library building; the other two are in the buildings of their respective departments. The main observatory, erected by the citizens of Detroit and known as the Detroit Observatory, contains a meridian circle constructed by Pistor and Martins of Berlin, and a refracting telescope with an object-glass of 13 inches diameter; there is also a small observatory near this main building, containing a 6-inch equatorial telescope. Two hospitals are connected with the University, one under the direction of the Department of Medicine and Surgery, the other under the charge of the Homeopathic Medical College, with each of these is connected a training school for nurses. Ample provision is made for physical culture and athletics, besides the two well-equipped gymnasiums, already mentioned, there is an athletic field of 30 acres; the general supervision of athletic sports is vested in a board of control of nine members, on which the faculty is represented by five members chosen from the University senate, and the students by four members chosen by the directors of the Students' Athletic Association. Important among student organizations is the University Oratorical Association, established by the students of the Department of Literature, Science and Art to foster an interest in oratory and debate; this association is affiliated with the Northern Oratorical League, composed of similar associations of the universities of Iowa, Minnesota, Wisconsin, Chicago, and Oberlin College and Northwestern University; and with the Central Debating League, in which the universities of Chicago and Wisconsin, and Northwestern University are also represented. In 1903 the total income was \$741,000, including the State appropriation; the fees to students are small, being somewhat less for residents of the State than for non-residents. In 1910 the number of students was 4,755; not including the pupils who attended the summer session. The president is H. B. Hutchins.

Michigan City, Ind., city in Laporte County; on Lake Michigan, and on the Chicago, I. & L., the Michigan C., and the Lake E. & W. R.R.'s; about 40 miles east of Chicago. The place was visited frequently in the 18th century by missionaries, explorers, and traders, but the first permanent settlement was made in 1833. The incorporation was made in 1837. It has excellent transportation facilities which contribute to its commercial and industrial growth. Its chief manufactures are hosiery, knit underwear, chairs, lumber, railroad cars, and furniture. It has a large trade in iron ore, salt, lumber, and farm products. It has the Northern Indiana State Prison, a United States life-saving station, and on the lake front a park. Its educational institutions are a high school, public and parish schools, and a public library.

The city is governed under a charter of 1867, since amended, which provides for a mayor, elected biennially, and a common council. The

administrative officials are elected by the council or appointed by the mayor subject to the approval of the council. The waterworks are owned and operated by the city. Pop. (1890) 10,776, (1900) 14,850; (1910) 19,027.

Michigan College of Mines, at Houghton (q.v.) in the State of Michigan, was founded in 1885 and opened in 1886. The school is located in the midst of the mining region of the State, thus giving the students exceptional opportunities for observation and study. Practical work in mine surveying and mining is carried on for five weeks, forty-five hours each week. The first two weeks are devoted to surveying and mapping a mine in the "copper country" or in the iron mining district; the last three weeks are given to the examination of mining methods, and to making sketches of mines in the vicinity. The courses of study lead to the degrees of Bachelor of Science and Engineer of Mines.

The school is well equipped with all necessary apparatus. The metallurgical and assay laboratory is a brick building; and the ore-dressing building, or stamp mill, is a wooden building. A reverberatory roasting furnace stands near the mill.

Michigan State Agricultural College, chartered in 1855, and opened in 1857, situated at Lansing. It was the first institution for agricultural education established in the United States. The Michigan State constitution provided that "The legislature shall as soon as practicable provide for the establishment of an agricultural school." In 1850 the legislature petitioned Congress for a grant of land for an agricultural college within the State, but no attention was paid to this petition. In 1855, however, the legislature appropriated land and money for such a college, and located it on a farm of 684 acres. From that time until 1862 the college was supported by State appropriations; and in that year received control of the Federal land grant. The courses offered in the college include the full four years' courses in agriculture, mechanical engineering, and domestic science; and short courses (varying from four to twelve weeks) in chemistry, beet sugar production, cheese making, dairy husbandry, creamery management, live-stock husbandry, and fruit culture; graduate work is also provided for. The college organizes Farmers' Institutes throughout the State, which are under the supervision of members of the faculty; in 1909, 200 institutes, with an attendance of 90,000, were held. The experiment station is also connected with the college, and receives a separate Federal appropriation of \$15,000 annually. Women are admitted to all courses, but form a small proportion of the graduates. The farm consists of about 684 acres, and the buildings are valued at \$440,000. The library in 1910 contained 33,000 volumes. The income for that year was \$450,000; the students numbered 1,500, and the faculty 110.

Michipicoten, mīsh-ē-pē-kō'tēn, a bay in the western part of the province of Ontario, in Canada. It is an arm of Lake Superior, on the northeast shore; about 100 miles north of Sault Ste. Marie. At the entrance to the bay is Michipicoten Island.

Michoacan, mē-chō-ā-kān', Mexico, a state, on the Pacific Ocean; bounded on the north by the states of Guanajuato and Jalisco,

MICKEY — MICRONESIA

on the east by Mexico, on the south by Guerro and the Pacific, and on the west by the Pacific, Colima, and Jalisco. Area, 22,874 square miles. Two railroad lines cross the state. The surface generally is mountainous; in the north and south are some flat lands. The volcano of Jorullo is in the southwest. The largest drainage streams are Las Balsas and Lerma on the boundary, and the Tepalcatepec. There are a number of lakes within the state limits, the largest of which is Cuicatzen. Except where the lands are low the climate is healthful. The soil is fertile; the principal crops are sugar, tobacco, vanilla, wheat, rice, and tropical fruits. Considerable attention is given to stock-raising, and mining is carried on to some extent. The minerals are valuable. The capital is Morelia. Pop. about 40,000; of State, about 1,000,000.

Mickey, John Hopwood, American politician: b. near Burlington, Iowa, 30 Sept. 1845; d. 2 June 1910. He was educated in the Iowa Wesleyan University, and in 1863-5 served in the Iowa cavalry in the Civil War. He engaged in banking in 1879 and was a member of the Nebraska legislature in 1881-2. In 1902 he was elected governor of Nebraska.

Mickiewicz, mīts-kē-ty'ın, Adam Bernard, Polish poet: b. Novogródok, Lithuania, 24 Dec. 1798; d. Constantinople 26 Nov. 1855. He was educated at the University of Wilna, where he became affiliated with several of the leaders against Russian control. His first volume of poems appeared in 1822 and stamped him the greatest poet of his country. Implication in political affairs caused his banishment to Russia in 1824, but in 1828 permission to leave Russia was granted him and he traveled in Germany and Italy, and in 1834 he went to Paris, where, in 1840, he became professor of Slavonic language and literature in the Collège de France. Among his works are: 'Conrad Wallenrod' (1828); 'Crimean Sonnets' (1826); 'The Books of the Polish People and of the Polish Pilgrimage' (1832); 'Pan Tadeusz' (1834); etc. See L. de Loménie, 'Galerie des Contemporaines.'

Mickle, mīk'l, William Julius, Scottish poet: b. Langholm, Dumfriesshire, Scotland, 28 Sept. 1735; d. Forest Hill, near Oxford, 28 Oct. 1798. He removed to London in 1764, and in 1775 appeared his principal production, a translation of the 'Lusiad' of Camoens, with a historical and critical introduction, including a life of Camoens. His poetical works were published collectively, with memoir by Sim, in 1806. Among the best of Mickle's poems is the ballad of Cummor Hall, which has attained additional celebrity as having suggested to Sir Walter Scott the groundwork of his novel of 'Kenilworth.' The popular song, 'There's nae Luck about the Hoose,' has been claimed for him; others ascribe it to Mrs. Jean Adams, schoolmistress, near Greenock.

Micmacs, mīk'mīks, a tribe of American Indians. See ALGONQUIAN.

Microbe (Greek *μικρός*, little; *βίος*, life), a microscopic organism; applied particularly to bacteria, and more especially to the pathogenic forms. See BACTERIA.

Microcosm and Macrocosm. Among the ancients a belief prevailed that the world or cosmos was animated, or had a soul. This theory led to the notion that the parts and mem-

bers of organic beings must have their counterparts in the members of the cosmos. The natural philosophers of the 16th century took up this theory in a somewhat modified shape, and considered the world as a human organism on the large scale, and man as a world, or cosmos, in miniature; hence they called man a microcosm (Greek, 'little world') and the universe itself the macrocosm ('great world'). Heylin gave the title 'Microcosmus' to a work on cosmography in 1621.

Microcosmic Salt, used in blowpipe analysis; prepared by mixing concentrated solutions of phosphate of soda and chloride of ammonium. It has the composition $\text{NaNH}_2\text{HPO}_4 \cdot 4\text{H}_2\text{O}$.

Microles'tes. See PLAGIAULACIDE.

Microlite (Greek, 'small'), a native pyro-tantalate of calcium, containing fluorine, and also niobium, and various other bases. The formula has not yet been satisfactorily determined. Microlite crystallizes in octahedral forms belonging to the isometric system, and the crystals are often very small. It was first found at Chesterfield, Mass., where the crystals were so minute as to suggest the name 'microlite.' Excellent crystals as much as an inch in diameter have since been found in Amelia County, Va., as well as imperfect ones weighing as much as four pounds. The mineral is usually yellow or brown in color, with a resinous lustre, a hardness of 5.5, and a specific gravity of from 5.5 to 6.1.

Microm'eter, an instrument for measuring minute angles and distances. The 'double-image micrometer' is of importance in measuring the diameter of a celestial object; it is an eye-piece containing two halves of a lens, each half being movable by a micrometer screw (q.v.) in a direction parallel to the common diameter. When the halves form one lens the heads of the screws indicate zero. In making an observation of the diameter of a heavenly body the half-lenses are so moved that the image formed by one of them of one limb of the body coincides with the image of the opposite limb formed by the other half-lens; the readings of the screw-heads determine the apparent diameter of the body.

Micrometer Screw, in optics, a screw attached to instruments for exact measurement of very small angles. The great space through which the lever of the screw passes, in comparison with the longitudinal motion due to the pitch, affords the means for a positive motion which is imperceptible on the object moved, though appreciable in its results.

Micron, mī'kron (Greek, 'very small'), a unit of length equal to the millionth part of a metre, or the 25,400th part of an inch. It is much used among physicists in connection with precise measurements, and has been officially sanctioned by the International Commission of Weights and Measures. The Greek letter μ is used as its symbol. Thus 47μ is read '47 microns.' The names 'bicon' and 'tricon' have been proposed, respectively, for the billionth and trillionth part of a metre, but they have not been generally adopted, and probably will not be. Etymologically, at least, they are monstrosities.

Micronesia, mī-krō-nē'shē-ā, the name given to a large number of islands in the Pacific Ocean,

MICROPHONE—MICROSCOPE

the natives of which have a light skin as distinguished from Melanesia (q.v.), the inhabitants of which are dark-skinned. The islands extend southward from Japan to New Guinea, the chief groups comprising the Gilbert Islands, Marshall Islands, Carolines, Pelew Islands, and Ladrones (qq.v.).

Microphone, an ingenious instrument, the invention of Professor Hughes (1878), whereby minute sounds can be transmitted in an intensified manner by means of electricity, the whole arrangement consisting of a transmitter and a receiver with a small voltaic battery and wires in circuit. Not only can ordinary sounds be transmitted, but musical sounds, singing, breathing, and conversation can be readily transmitted. And not only are sounds transmitted, but slight sounds are transmitted greatly increased in volume, the gentle touch of a feather or a camel's-hair pencil reaching the ear like the rasping of a file, while the scratch of a quill-pen in the act of writing is augmented to a loud noise. Even the tramp of a fly is distinctly audible.

Microsauri, an order of *Prosauroia*. See **HERPETOLOGY**.

Microscope, an optical instrument by which objects are so magnified that details invisible or indistinct to the naked eye are clearly observed. In the ordinary microscope the magnifying power is interposed directly between the eye and the object, in the manner of a magnifying glass; and although the power may consist of several lenses, they combine as one.

The microscope was invented between 1590 and 1600—the honors being divided between Hans and Zacharias Janssen, two Hollanders, and that greatest of early opticians, Galileo. From its early form, consisting simply of a double or plano-convex object lens with an eyepiece of a single convex lens to magnify the image, it developed by gradual stages until the latter part of the 18th century, without becoming much more than a toy for the amusement of the dilettante. As a matter of fact nearly every form of accessory which is in use at the present time was devised and used in some form, but the desire for the ornamental and extraordinary rather than the practical was everywhere manifest. With the awakening of general interest in scientific investigation, the microscope began to be used as a tool to accomplish heretofore impossible results. This led to more practical forms of construction, and at last to their production in large quantities and at a cost which placed them within the reach of laboratories and individuals. Among the early American pioneers in the optical improvement of the microscope, the names of Robert Tolles and the two Spencers stand prominent. By their extraordinary manual skill and knowledge of optical principles, they succeeded in producing lenses which, in the case of one by Tolles had a focal length of 1-75 inch, the highest power objective which has ever been constructed. The resolving power of microscope lenses was greatly increased and the problems of their manufacture materially simplified by the invention by Tolles of his "duplex front" objective, a construction which was voted impractical by the experts of the time, but which has since superseded all others in the construction of high power lenses.

The microscope is used as a necessary accessory in a large number of the sciences and in many industries. It is, primarily, the assistant of the teacher of biology, botany, bacteriology, histology, pathology and the allied branches of science. The medical profession employs it in the examination of the urine, blood and of cancerous and tumorous growths, as well as in searching for the parasites of the body, fungi which infest the hair and skin and for diagnosing febrile diseases. For the examination of steel, iron and other metals to determine their intimate structure, the microscope is extensively used. Its use for the detection of adulterations in foods, drugs, paints, earths, starches, and many other substances is often the only effective method of working. The bureau of animal industry of the United States Government depends wholly on the microscope for the detection of living parasites in the flesh of animals slaughtered for food. The microscope is used in many industries for counting fine lines, threads, and fibres, and for determining the physical structure of cements, emulsions and other substances. The finest possible measurements of space are made with the microscope to which a filar micrometer is applied, and with it the rate of growth in plants is determined.

FIG. 1.

Microscopes are divided into two classes—simple and compound, the former being confined to limited magnifications, rarely exceeding 20 diameters, whereas the latter may give as high as 4,000 diameters magnification. In the simple form the eye views the object directly (Fig. 1), whereas, in the compound form an enlarged image is formed by one lens, which image is magnified by another lens or pair of lenses, at the same time reversing it so that what is right in the object is left in the image. (Fig. 2.) A short focus positive lens becomes a simple microscope when used for viewing an object; its usual form is that of the Pocket Magnifier, and although generally consisting of more than one lens, either for improving its quality or to obtain a variety of powers, it always remains optically simple. The most simple forms are one or several single convex lenses, the latter offering a variety of foci. These lenses have two defects, one, chromatic aberration, which fringes the images with the colors of the spectrum, most noticeably red and blue, the other, spherical aberration, which is most noticeable by the increasing lack of distinctness toward the edge of the field. Improved forms are constructed to overcome these defects. The most simple of these is the Coddington, originally a section of a sphere, but as generally made, a thick double convex lens with a circular groove which acts

MICROSCOPE

as a diaphragm. The achromatic lens when composed of three lenses (triplet), two concave convex flint glass lenses enclosing and cemented to a double convex crown glass lens, is the best form. These are usually placed in a folding mounting for pocket use. The simple micro-

image formed by the objective is the one to which the eye is applied and is called the eye-piece or ocular. This latter, in its usual form, is called Huyghenian, after Huyghens, who used it in the earliest and most primitive telescope construction. It consists of two plano-convex lenses, suitably mounted in brass, the lower lens being called the field lens, the upper one the eye lens. It is a negative eye-piece, as its focus lies within itself, a diaphragm, which limits the field of vision being placed at this point. The magnification of the compound microscope (Fig. 4) depends upon three conditions: (1) The power of the object-glass, (2) the power of the eye-piece, (3) the amount of separation of these two optical parts. If the focus of the object-glass is reduced, the power is increased, and the same holds true with the eye-piece. The more the objective and eye-piece are separated, the greater will be the power. It will ap-

FIG. 2.

scope is also made in more complex form for dissecting purposes, a mechanical construction, more or less elaborate, being added, which provides adjustment for the lens in relation to the object, a platform or stage for the latter, and a mirror for reflecting light to illuminate the object. (Fig. 3.)

FIG. 3.—Dissecting microscope.

In the compound microscope the lens which gives the first magnified image is the one nearest the object, and therefore called object-glass or objective. The optical part which magnifies the

FIG. 4.—Compound microscope.

pear from this statement, therefore, that the magnification of the microscope is unlimited, but the mere magnification of an object is less sought after and is of less value in the modern microscope than its power to disclose detail and structure. The length of tube which connects the eye-piece and objective is limited to from six to eight inches, for the sake of convenience in use. The standard length of the microscope tube must be closely adhered to or else the optical capacity (correction) of the objective will be disturbed. The power of the eye-piece rarely exceeds 15 diameters and that of the objective 150 diameters. A convex lens of one inch focus gives a magnification of about 10 diameters at a distance of 10 inches, and this holds true of a combination of lenses of this

MICROSCOPE

equivalent focus as in the eye-piece. If therefore a one-inch focus eye-piece is 10 inches distant from a one-inch objective, the magnifying power is $10 \times 10 = 100$ diameters; or, if 5 inches distant, is one half as great, or 50 diameters. The designation of power is according to the focus of a single lens having the same magnifying power as the series or combination of lenses which make up the objective as well as eye-piece. As the image of the objective is magnified by the eye-piece, it is evident that any defect in the objective is magnified to the same extent, and unless eliminated would seriously interfere with obtaining a distinct image. The main problem, therefore, remains to convey through the objective as many image-giving rays, free from defects, as possible. As a matter of fact, objectives, whatever their power, are composed of a series of lenses whose purpose it is to correct errors which would exist if single lenses alone were used, and the greater the power of the objective, the larger the number of lenses required. In the low powers there are generally two systems of lenses, each of which is an achromatic doublet; in the medium powers the principal magnification is obtained by a single front or hemispherical lens and two systems of cemented and corrected lenses; in the

ordinary way in the very high powers, it is necessary to construct them for immersion contact with the object, and they are then termed "immersion objectives." The highest power in general use is the 1-12 inch focus, the medium powers are $\frac{1}{8}$ to $\frac{1}{4}$ inch and the low powers from 1 to $\frac{3}{4}$ inch.

To properly adjust the optical parts which have a fixed relation to one another by means of a tube (body) and to hold the object in its proper position in relation to them involves certain mechanical appliances which provide stability, convenience of adjustment and illumination: a rack and pinion provides coarse adjustment and a micrometer screw fine adjustment; both are extremely delicate; the stage or platform for placing the object, and mirror beneath the stage for reflecting abundant light and a base for stability. This aggregate of mechanical parts is called the "stand." The collar at the end of the tube to which the object glass is applied is the nose-piece; double and triple nose-pieces are also made to take two and three objectives, which may be rotated and focused on the object in turn. A mechanical stage provides delicate means of adjusting the object in place of the hands. The high powers require more than the usual amount of light for illumination and a condenser gathers it from the mirror and concentrates it upon the object. Micrometers are provided to determine the amount of magnification and measure the actual size of an object. A camera lucida is made to project the magnified image upon a sheet of paper on the table to facilitate its drawing. Beside the microscope with single tube, there is another in which the rays from the objective are bi-sectioned and diverted into a second tube, so that the object may be viewed with both eyes. This is the binocular microscope and with low power objectives gives a beautiful stereoscopic effect. So far as our knowledge of the action of light and the constitution of visual images goes, the best microscopes now made realize about the limit to which the seeing powers of the instrument can be brought, although experiments with especially controlled illumination, now in progress, may result in advancement in this direction. Nevertheless the field of research and discovery into which the microscope has as yet not penetrated, and which are within its powers, are almost unlimited.

FIG. 5.—A low power ($\frac{1}{4}$ ") microscope objective of two systems. FIG. 6.—A high power (1-12") microscope objective of four systems.

high powers it is usual to employ two superposed hemispherical lenses, adding thereto two corrected combinations. As may be supposed the production of these lenses and setting them in mountings involves the most accurate processes. First of all the various kinds of glass must have fixed and prescribed properties and be of absolute homogeneity and freedom from blemishes. The production of such glass is in itself a laborious and delicate process. The lenses must be accurately ground and polished to absolutely correct spherical surfaces, truly centred and cemented, then set in suitable mountings without strain at absolutely correct distance and the axes of all in alignment. The efficiency of an objective to gather up rays emanating from an object and form a perfect image is termed the angular or numerical aperture and the extent of it really determines the visibility of detail, correction for chromatic and spherical aberration being presupposed. It is only with the increase of power in objectives that it is possible to increase the numerical aperture. On account of the loss of light and inability to obtain sufficient angular aperture in

The use of the microscope for photography also embraces an extremely wide and useful field. Photographs of minute objects enlarged as much as 5,000 diameters (25,000,000 areas) can be produced in this manner, and a permanent record made which can also be used for reproduction by the usual printing processes for the illustration of books, etc. Recently the movements of insects and other small creatures have been reproduced by a biographic microscope, and living pictures of the unseen world are now presented to audiences as a means of amusement.

MICROSCOPICAL SOCIETY—MIDAS

Microscopical Society. The American. See AMERICAN MICROSCOPICAL SOCIETY, THE.

Microscopium, in astronomy, one of the 14 constellations which Lacaille added to the heavens in connection with his work at the Cape of Good Hope. It is a very inconspicuous constellation, its brightest star being of only 5.2 magnitude.

Microscopy, Clinical, the use of the microscope in the diagnosis of disease. The microscope, ever since its first construction, has been used in the study of disease processes, but only within comparatively recent years has it attained its present importance as an adjunct in the clinical diagnosis of many different types of disease. Owing to the development of knowledge of parasitic and infectious diseases, the physician of to-day is better able to make an accurate diagnosis by means of the microscope than were his forefathers. The microscope may be used not only to confirm a diagnosis which has been made by ordinary clinical methods, but it may abbreviate such clinical examination, or by it a diagnosis may be made without such preliminary examination. Thus at the present time consumption of the lungs may be microscopically diagnosed by an examination of the sputum, though the patient be 1,000 miles away, and in the same manner a number of diseases of allied forms may be recognized by certain minute evidences interpretable by the microscope.

The most important of the intestinal parasites that can be thus identified are the tapeworm, roundworm, hook-worm, fluke-worm, and pin-worm. In all of these the physician of the present time, by a microscopical examination of the faeces, can detect the presence of the eggs of the different kinds of worms and make a definite diagnosis. It is not necessary for parents to guess at the presence of worms and to treat their children "on suspicion." The presence or absence of worms can be accurately and definitely determined by a competent microscopist. Not only can a diagnosis of worms in general be made, but the precise kind of worm can be known by the characteristic configuration of the eggs. Examination of the faeces by the microscope can further detect various forms of indigestion and various kinds of inflammation in the intestinal tract.

As already indicated, tuberculosis can be told by an examination of the sputum, and the bacillus of tuberculosis can also be identified if it invades other organs of the body, notably the skin, bladder, kidneys, etc. The presence of tuberculosis in milk can also be demonstrated by the microscope. The influenza bacillus, the bacillus of diphtheria, the organism of cholera, of dysentery, of malignant pustule, of blood-poisoning, of pneumonia, of actinomycosis, etc., can all be identified by a microscopical examination, as also can a number of diseases due to animal parasites in the body, other than intestinal worms. Thus there is no excuse for the general diagnosis of malaria unless the exact confirmatory evidence of the malarial parasite is found in the blood. The presence of *Trichina* in the body can also be learned by the peculiar changes that take place in the blood, and the blood-parasite *Filaria* (see FILARIASIS), which causes a variety of conditions in the tropics, is recognizable under the microscope. Further, the microscopical examination of the blood itself

offers a large field for clinical microscopy; a field which is very rapidly widening and offering increasing evidence of the value of this class of examination. There are many blood-diseases, *per se*, which can be diagnosed by simple examination. Anemia and pernicious anemia are important examples. Moreover, most of the acute infectious diseases cause certain changes in the blood which may be utilized in microscopical work for diagnostic purposes. The Widal agglutination reaction (q.v.) in typhoid fever is an important development in this line. Other agglutinating reactions are of immense importance in medico-legal work. These blood-changes are of a very definite character, and have been studied by physicians the world over. Because of their peculiar technical nature they lend themselves to charlatan misinterpretation and serve as a basis for many quackish advertisements.

Microscopical examination of the urine has long been practised. By it various forms of disorder of the bladder and of the kidney can be told, and both renal disease and bladder-disease can be detected long before such troubles become chronic and dangerous. In much the same manner the microscope can be used to examine other secretions and excretions of the human body—the secretions from the nose, the vomit, the exudates in pleurisy, exudates in meningitis and peritonitis, etc.—and in the study of drinking-water, milk, and foodstuffs. In fact there is no branch of medicine in which definite and far-reaching results have not been obtained by means of the microscope. Consult: von Jaksch, 'Clinical Diagnosis'; Simon, 'Clinical Diagnosis'; Ewing, 'Pathology of the Blood'; and Cabot, 'The Blood.'

Microtasmeter, an instrument invented by Thomas A. Edison in 1878. He uses the principle of the carbon microphone to measure infinitesimal pressure, or for detecting very slight pressure.

Microtome, an instrument for cutting thin sections of portions of plants and animals preliminary to their microscopic examination. The objects to be cut are imbedded in some material such as paraffin or celloidin, or frozen in gum, which makes the slicing of minute or delicate objects readily feasible. The cutting used to be done by holding the prepared object in one hand and wielding a razor in the other, but this method, apt to yield sections of unequal or insufficient thinness, has given place to the use of some device by which a sliding razor slices a fixed but adjustable object, or by which the object is made to move up and down across the edge of a razor. Many forms are on the market.

Midas, mī'das, in Greek myth, a king of Phrygia, proverbial for his golden touch and for his ass's ears. The gift of the golden touch came from Bacchus, whose follower, Silenus, Midas rescued and treated kindly; in return Bacchus offered him any wish he would name and Midas asked that all that he touched should be turned into gold. When he found that food and drink became gold at the touch of his lips, Midas besought Bacchus to take back the gift; some stories say he was sent to bathe in the river Pactolus, which ever after was full of gold-bearing sand. His ass's ears

MIDAS MONKEY—MIDDLEBURG

were given Midas by Apollo to punish the king for declaring Pan's pipe more musical than Apollo's lyre. Hence "ears of Midas" is a phrase used of ignorant critics. Midas' barber discovered the king's secret deformity; and whispered it into a hole in the ground, when grew up reeds whispering the story in the wind.

Midas Monkey, a marmoset (q.v.).

Middelburg, mid'del-boorg, Netherlands, capital of the province of Zealand, on the island of Walcheren, $4\frac{1}{4}$ miles northeast of Flushing. Middelburg was a mediæval Hanse town, and one of the leading mercantile cities of the United Provinces, sending many ships to the East and West Indies, and the Levant. Its former commercial importance, however, has declined, being now confined chiefly to a coasting and domestic trade.

Middle Ages, *The*, a period of history supposed to extend from the fall of the Roman Empire to about the year 1550, covering from 10 to 11 centuries. The Middle Ages embrace that period of history in which the feudal system was established and developed, down to the most prominent events which necessarily led to its overthrow, though its consequences and influences are still very observable in the states of Europe. The first centuries of the Middle Ages are often termed the Dark Ages (q.v.), a name which they certainly deserve. Still, the destruction of Roman institutions by the irruption of barbarous tribes is often unduly lamented, and the beneficial consequences attending it overlooked. True it is that many of the acquisitions which had cost mankind ages of toil and labor were lost in the general wreck, and only regained by the efforts of many successive generations; the flowers of civilization were trampled under foot by barbarous warriors; the civil development of society suffered a most severe shock; those nations to which Roman civilization had extended previous to the great invasion of the Teutonic tribes were thrown back in a great measure to their primeval barbarism, and the unruly passion for individual independence greatly retarded the development of public and private law, and in some countries has entirely prevented a regular civil constitution. So also the most remarkable institution of that time, its characteristic production—chivalry—exhibited all the peculiarities of the corporations. War was the profession of the nobles. No one of their order who was not a knight could bear a lance or command cavalry. The weak side of the Middle Ages is the scientific. Physical science was still in a very crude state, and the lack of the proper apparatus necessary for its accurate pursuit was a serious handicap. Considering, however, the inefficient means then at hand, the knowledge attained, though of course rude, inaccurate and often mere guessing, was greater than is popularly supposed. The efforts of Charlemagne in the 8th century to encourage science and instruct the people laid the foundations for a more thorough and systematic training, which culminated in the great schools of Scholasticism of the 12th and 13th centuries. The process was slow and often retarded by the unsettled social and political conditions that prevailed through this period. The 14th and 15th centuries witnessed a rapid and brilliant development finding its apogee in the renaissance movement. See **HISTORY**.

Middle English. See **ENGLISH LITERATURE**.

Middle Kingdom, *The* (Chinese, Tchangkooe), a name applied to the Chinese empire by the natives, who imagine that it is located in the middle of the earth.

Middleboro, mid'l-bôr-ô, Mass., town in Plymouth County; on the Nemasket River, and on branches of the New York, N. H. & H. railroad; about 30 miles south of Boston and 18 miles northeast of Fall River. It is one of the oldest towns in the county, having been incorporated 1 June 1660. It includes the villages of Nemasket, North Middleboro, South Middleboro, Four Corners, Puddingshire, Waterville, Tack Factory, Eddyville, Rock, the Green, and Thomastown. It has excellent water-power, obtained from three falls. The chief manufactures are woolen goods, shoes, stove polish, lumber, dressed marble, grates, foundry and machine-shop products. It has several well-built churches, good schools, and a public library. It is a favorite summer resort, on account of its attractive scenery and the temperature being modified by the sea breezes. Pop. (1900) 6,885; (1910) 8,214. Consult Barber, 'Historical Collections of Massachusetts.'

Middleburg, mid'l-berg, **Aldie and Upper-ville, Cavalry Engagements at**. On 16 June 1863 Gen. Stuart, with three brigades of his cavalry division, moved north from the Rappahannock to screen the movement of the Confederate army toward the Potomac. Stuart's orders were to keep along the eastern base of the Blue Ridge, occupy the passes of Bull Run Mountain, and cover the front of Longstreet's corps. On the 17th Fitzhugh Lee's brigade, under Col. Munford, was sent from Piedmont, by way of Middleburg, to Aldie, to hold the gap in the mountain as a screen to Longstreet's movements, while W. H. F. Lee's brigade reconnoitred toward Thoroughfare Gap. Robertson's brigade was posted at Rectortown. Stuart, with his staff and a few pickets, made his headquarters at Middleburg. Gen. Pleasanton was near Manassas Junction and scouting in the direction of Bull Run Mountain, and at 2:30 P.M. of the 17th Kilpatrick's brigade of cavalry ran into Munford's pickets, driving them back to Aldie, where, west of the village, he found Munford strongly posted on a hill covering the road to Snicker's Gap. A severe engagement ensued, lasting until dark, when Munford withdrew toward Middleburg, under orders from Stuart, who had been attacked. The Union loss was 50 killed, 131 wounded, and 124 missing. Munford's loss was 119 killed, wounded, and missing. While Kilpatrick was engaged at Aldie Col. Duffié, with the First Rhode Island cavalry 300 strong, having passed through Hopewell Gap, reached Middleburg about 4 P.M., drove in Stuart's pickets, and occupied the town. Stuart narrowly escaping to Rector's Cross Roads, and sending orders for Munford to withdraw from Aldie, the other two brigades to move upon Middleburg, and all to concentrate against Duffié. Robertson's brigade arrived at 7 P.M. and attacked Duffié, who made a good fight behind stone walls and barricades, repelling several assaults, but was finally driven from town, with severe loss, and compelled to retreat by the road upon which he had come until he had crossed Little River, where he halted, and where during the night he was entirely surrounded by

MIDDLEBURY—MIDDLESBROUGH

W. H. F. Lee's brigade. Duffié endeavored to cut his way out, but was met by heavy fire, and a great part of his command captured, Duffié escaping with a few men and making his way back to Hopewell Gap and Centreville. His total loss, killed, wounded, and prisoners, was over 200. On the 18th Stuart took position outside of Middleburg with Robertson's brigade. Munford was on the left at Union and Jones' brigade was ordered up as a reserve. Pleasanton moved forward with all his available force, and occupied Middleburg and Philemont on the road to Snicker's Gap. On the 19th Gregg, with two brigades of his own division and one of Buford's, advanced and steadily drove Stuart in the direction of Upperville, losing 99 killed, wounded, and missing. During the day Hooker advanced and occupied Aldie Gap with infantry. On the 20th Stuart concentrated his five brigades about three miles west of Middleburg, Pleasanton remaining at Middleburg. On the morning of the 21st Pleasanton moved out of Middleburg. Buford's division by the road through Union, to turn Stuart's left, Gregg's division, supported by Vincent's infantry brigade on the main road to Upperville. Buford encountered W. H. F. Lee's and Jones' brigades and drove them back, and Gregg met Hampton's and Robertson's brigades, driving them steadily to Goose Creek, where they remained several hours, when they again fell back to effect a junction at Upperville with Jones and W. H. F. Lee, who were falling back before Buford. As Pleasanton neared Upperville the fight increased in severity, and Stuart was driven through the town to Ashby's Gap. The Union loss during the day was 12 killed, 130 wounded, and 67 missing. On the 22d Pleasanton fell back to Middleburg and Aldie. The Union loss June 17-21 was 883 killed, wounded, and missing; the Confederate loss was 65 killed, 279 wounded, and 166 missing, an aggregate of 510. Consult: 'Official Records,' Vol. XXVII; Doubleday, 'Chancellorsville and Gettysburg'; McClellan, 'Life of Maj.-Gen. J. E. B. Stuart.'

E. A. CARMAN.

Middlebury, mid'l-bēr-ī, Vt., village, county-seat of Addison County; on the Otter Creek, and on the Rutland railroad; about 40 miles in direct line southwest of Montpelier, the capital of the State, and 35 miles south of Burlington. It is on the eastern slope of the Green Mountains, near the foot-hills. It is in an agricultural and stock-raising region, with large marble quarries in the vicinity. It was settled in 1773, but was abandoned during the Revolutionary War, because it was on the route traversed by many of the British and Indian soldiers, and the lives of the people were constantly in danger. It was incorporated as a borough in 1813 and as a village in 1832. The chief manufactures are lumber and lumber products, foundry products, flour, lime, dressed marble, and dairy products. The village is the seat of Middlebury College (q.v.), and has two libraries, and the Sheldon Art Museum. Some of the principal buildings, besides the college, libraries, and museum, are the opera house, court-house, several churches, and the public and parish schools. The water-power is most valuable, and sufficient for more manufacturing establishments. The government is vested in a board of trustees elected annually; the subordinate offi-

cials are chosen by the trustees. Pop. (1900) 1,897; (1910) 2,848. Consult Swift, 'History of the town of Middlebury.'

Middlebury College, in Middlebury, Vt., has a charter which bears the date 1 Nov. 1800. The first meeting of the corporation was held 4 Nov. 1800, when Jeremiah Atwater was made president, and Joel Doolittle, tutor, both graduates of Yale. The college opened 5 Nov. 1800, with seven students. The building used was a part of a large wooden structure erected for the Addison County Grammar School. For a number of years the school was sustained mainly by the generous contributions of the people of Middlebury. In 1810 Col. Seth Storrs, one of the trustees, gave to the college 30 acres of land which is now a part of the campus. In 1815 Painter Hall was built on this land, a building named after Gamaliel Painter, a generous benefactor. The same year the State legislature passed a vote complimenting the new college on its success, but gave no pecuniary assistance. Later bequests came; 5,000 acres of wild land and \$14,000. To these gifts donations were added, but the college had a struggle for existence and the brunt was bravely borne by the loyal faculty and the generous people of Middlebury. The Civil War took away a number of the best and bravest, as it depleted the colleges all over the country. Statistics show that up to and including 1902, there have been 1,567 graduates. Of this number 538 became clergymen; 100 professors in colleges and seminaries; 366 lawyers, including 50 judges; and 93 physicians. Nine of the graduates have been governors of States and Territories. From 1883 to 1902 the college has been coeducational; in 1902 the legislature of the State granted a charter authorizing the establishment of a separate college for women.

The courses lead to the degrees of B.A. and B.S. Various prizes and the incomes of 120 scholarships are available for assisting worthy students. The library contains nearly 30,000 volumes; the new marble library building is a gift from Egbert Starr and Dr. M. Allen Starr. Other buildings, all of stone, are the Warner Science Hall, the chapel, the Painter Hall, Battel Hall (women's building), and the dormitories for young men. In 1910 there were connected with the school 20 professors and instructors and 275 students. The productive fund was \$484,200 and the income nearly \$55,000.

Middlemarch, a novel by George Eliot, published in 1872. This the author is said to have regarded as her greatest work. It takes its name from a provincial town in or near which its leading characters live. The book is really made up of two stories, one centring around the Vincy family, and the other around Dorothea Brooke and her relatives. In the characters of Dorothea and Lydgate George Eliot develops the main purpose of this novel, which is less distinctly ethical than some of her others.

Middlesbrough, mid'lz-brō (not Middlesborough), England, a river port, municipal county, and market town, in the North Riding of Yorkshire, near the mouth of the Tees, 44 miles north of York. Middlesbrough dates from about 1830, and the development of the coal and iron mines of the neighboring Cleveland Hills and Durham fields. It is distinguished for its municipal enterprise; has wide and regular

MIDDLESEX FELS—MIDDLETON

streets, handsome public buildings; and extensive and commodious docks. Its chief industries are connected with iron manufactures, producing annually over 2,000,000 tons of pig-iron; in 1901 it exported 660,785 tons of pig-iron, and 353,649 tons of manufactured iron and steel. It has numerous blast-furnaces and rolling-mills, foundries, engineering works, ship-yards, etc.; and salt is extensively worked, there being a thick bed of rock salt at a depth of 1,300 feet. The borough was incorporated in 1853 and received a county charter in 1888.

Middlesex (mid'l-sēks) **Fells**, Boston, Mass., a picturesque hill, wood, and lake reservation of the metropolitan park system of "Greater Boston," enclosing Mystic Lakes; area from 3,000 to 3,200 acres. The Fells are part of the suburban townships of Malden, Melrose, and Stoneham north of Boston.

Middleton, mid'l-tōn, **Arthur**, American colonist: b. South Carolina 1681; d. 1737. He was conspicuously engaged in public affairs as a member of the council as early as 1712; and exerted his political influence in favor of popular claims, opposing the lords proprietors, and finally heading the revolution which threw off the whole proprietary government and placed the colony under the immediate protection of the crown (1719). In 1725 he succeeded Nicholson as acting governor of the colony, which office he held till 1731, when the royal governor arrived; he then retained his position in the governor's council. His administration as governor was partly occupied by war and negotiations with the Spaniards of Florida and the French of Louisiana.

Middleton, **Arthur**, American patriot, signer of the Declaration of Independence, grandson of the preceding: b. Middleton Place, Ashley River, S. C., 26 June 1742; d. Goose Creek, S. C., 1 Jan. 1787. He was educated in England at the University of Cambridge, then returned to South Carolina for a time, and was a member of the legislature, but went abroad again for two years' travel on the Continent. On his final return to America, he established himself as a planter, and soon became one of the leaders of the Revolutionary party. He was one of the most efficient members of the first council of safety, and in 1775 was sent to the Provincial Congress. In 1776 he was sent as a delegate of the State to the Continental Congress, and as such affixed his signature to the Declaration of Independence. He held his seat in Congress until 1777, declined the governorship of South Carolina in 1778, and took the field for the defense of Charleston in 1779. His plantation was devastated by the British and he was made a prisoner after the fall of Charleston in 1780, and was one of the leading citizens who were kept in confinement as hostages. His estate was sequestered, and he was shipped to the castle of Saint Augustine, and thence transferred to the Jersey prison ship. Exchanged in the latter part of 1780, he served till the close of the war as a delegate in the Continental Congress, and was afterward elected to the State senate. He was a skilful stenographer, and reported many of the debates in which he participated. He also wrote effective political essays under the signature of "Andrew Marvell."

Middleton, **Conyers**, English clergyman: b. York (or Richmond) 27 Dec. 1683; d. Hilder-

sham, Cambridgeshire, 28 July 1750. He was graduated from Trinity College, Cambridge, in 1703; became fellow of the college in 1706; was one of the 30 fellows who petitioned against Bentley, then master of Trinity, in 1710; was involved in a dispute with Bentley as to a fee paid by him to Bentley upon his receiving the D.D. (1717); and was sued for libel by Bentley for statements made in his 'Present State of Trinity College' (1719). The feud was adjusted by a compromise. In 1731-4 he was Woodwardian professor of mineralogy. For his part in a controversy with Waterland regarding the historical accuracy of the Bible, he was threatened with the loss of his degrees. His best-known work is the eulogistic 'Life of Cicero' (1741), once highly esteemed for its style, but in part plagiarized from Bellenden's 'De Tribus Luminibus Romanorum.' His treatises on "the Miraculous Powers which are supposed to have subsisted in the Christian Church from the earliest ages" (1748-9) aroused much comment.

Middleton, **Sir Frederick Dobson**, British soldier: b. Belfast, Ireland, 4 Nov. 1825, d. England 1898. He was graduated from the Royal Military College at Sandhurst in 1842, and entering the army served in many campaigns in the colonies and received the Victoria cross for gallant conduct in India. In 1884 he was placed in command of the Canadian militia and crushed the Riel rebellion, in recognition of which service he was knighted. He returned to England in 1890.

Middleton, **Henry**, American politician and diplomat: b. Middleton Place, S. C., 1771; d. Charleston, S. C., 14 June 1846. He was elected to the State legislature in 1801, serving till 1810. He was soon recognized as a leader, and in 1810-12 was governor of the State. He supported the war policy in 1812, and in 1813 he was elected to Congress, where he served four years. In 1820 he was appointed minister to Russia, in which capacity he negotiated a treaty regulating trade and fisheries in the Pacific (1824). He returned to the United States in 1830, and retired from public life.

Middleton, **Thomas**, English dramatist: b. probably in London about 1570; d. Newington Butts July 1627. Little is known of his life, but his writings testify to the excellence of his education before his entry at Gray's Inn in 1593 (or 1596). Several minor prose works preceded what seems to be his first play, 'Old Law,' written with Rowley in 1599. From that time on he wrote constantly for the stage, now alone, now with Rowley, Massinger, or Dekker. Among these works are several masques, of which the best and most dramatic is 'The World Lost at Tennis.' Middleton's 'Witch' is his best known work because of the clamor, often made since its publication in 1778, that it must have furnished hints for the song of the witches in Shakespeare's 'Macbeth'; but Middleton's verse, which is particularly reminiscent of 'Romeo and Juliet,' and his imitation of Shakespeare, as, for example, of 'Hamlet' and 'Tempest,' possibly of 'Pericles,' too, in 'The Mayor of Quinborough,' make such a view untenable. It is more likely that the songs were taken from Middleton's play and inserted into the acting edition of 'Macbeth.' The most successful play by Middleton was 'A

MIDDLETON—MIDDLETOWN

Game of Chess, which satirized the wooing of the Spanish Infanta and was stopped by privy council; it packed the playhouses because of its political and Protestant tone. Among his other plays are *'Michaelmas Term'* (1607), a story of city intrigue; *'A Trick to Catch the Old One'* (1608), his best comedy of intrigue; *'The Roaring Girl'*; *'The Spanish Gipsy'*, which, like the *'Mayor of Quinborough'* and *'A Mad World'*, has the Hamlet-like trick of a play within a play; and *'Women Beware Women'*, his best single play. As a rule Middleton is erratic and ill-sustained, and his characters low and coarse, but sometimes wonderfully analyzed. Consult the editions by Dyce (1840) and Bullen (1886), and Swinburne's essay in the *'Nineteenth Century'* for January 1866. Middleton's best plays appear in a volume of the *'Mermaid Series'* (1887).

Middleton, Thomas Fanahawe, English prelate and classical scholar; b. Kedleston, Derbyshire, 26 Jan. 1769; d. Calcutta 8 July 1822. He was educated at Christ's Hospital, London, and Pembroke Hall, Cambridge; took orders in the Anglican Church, and in 1814 was consecrated first bishop of Calcutta. He wrote *'The Doctrine of the Greek Article applied to the Criticism and Illustrations of the New Testament'* (1808, 5th ed. 1858). Consult *'Life'* by Le Bas (1831).

Middleton, Canada, a town of Annapolis County, Nova Scotia, 102 miles northwest of Halifax. Its industries are connected with the valuable iron and copper mines in the neighborhood, and it has railroad interests as a station on the Windsor & Annapolis railroad, and as the northwest terminus of the Nova Scotia Central railroad.

Middleton, England, a market town, municipal and parliamentary borough, in Lancashire, 5 miles northeast of Manchester. Its industrial establishments include cotton and silk factories, dye and print works, ironworks, chemical works, etc., and coal is mined in the vicinity. The grammar school was founded in 1572, and there are four free libraries and reading rooms, parks, recreation grounds, and a handsome market-place.

Middletown, mid'l-town, Conn., city, county-seat of Middlesex County; on the Connecticut River, and on the New York, New Haven & Hartford railroad; about 18 miles south of Hartford. It is opposite Portland, where are valuable brownstone quarries. The places are connected by a long drawbridge.

The city was founded in 1650 and the next year was incorporated as a town under the name of Mattabesec. Two years later the name was changed to Middletown. It was granted a city charter in 1784. For a number of years there was considerable trade with the West Indies, and until 1886 Middletown was the port of entry. In that year the custom-house business was removed to Hartford.

Middletown is in an agricultural region in which tobacco is one of the principal products. The good water-power here has aided in making the place a manufacturing city. The chief manufactures are pumps, bone goods, cotton webbing, hammocks, rubber goods, silks, harness trimmings, locks, marine hardware, and silver-plated ware. The educational institutions are

the public and parish schools, the Wesleyan University (q.v.), the Berkeley Divinity School (P. E.), opened in 1854, and the Russell Free Library which contains about 15,000 volumes. It has the State Hospital for the Insane, and the State Industrial School for girls.

The charter of 1882, under which the government is administered provides for a mayor, who holds office two years, and a city council. The subordinate officials are chosen by the mayor and council. Pop. (1900) 9,859; (1910) 20,749.

Consult: Whittemore, *'History of Middlesex County, Conn.'*

Middletown, Del., town, in Newcastle County; on the Philadelphia, Wilmington & Baltimore railroad; about 22 miles south by west of Wilmington, the capital of the State. It is in an agricultural region in which the chief productions are fruits. The principal manufactures are canned-fruits, wagons, and agricultural implements. The population is estimated at 2,000.

Middletown, N. Y., city, in Orange County; on the New York, Ontario & W., the New York, Susquehanna & W., and the Erie R.R.'s; nearly midway between the Hudson and Delaware rivers, and about 66 miles northwest of the city of New York. Middletown was settled about the middle of the 18th century; its location on the Minisink road, the route to the "West," and half-way between the important rivers of this section, gave the place its name, and its early importance. At first it was included in the Walkill township. In 1848 it was incorporated as a village, and 27 June 1889 was chartered as a city. It is in a fertile agricultural region, and has a large trade in dairy products, live-stock, and garden produce. It has the New York, Ontario & Western railroad shops, and the chief manufactures are hats, shirts, saws, printers' supplies, files, carpet-bags, leather, condensed-milk, paper boxes, and cigars. Some of the noted public institutions are the State Homoeopathic Hospital for insane, with 1,300 patients (1903), the churches, and the schools. There are seven churches, seven public schools (ward schools), one parish school, an excellent high school, Saint Joseph's Academy (R. C.), and the Thrall Public Library. There are two national and one savings bank, which with one trust company bank have a combined capital of \$400,000.

The government is administered under a charter of 1902 which provides for a mayor, who holds office two years, and a common council of nine members, each one of whom holds office two years. The mayor appoints, subject to the approval of the council, the members of the board of health, and the council elects the engineer, city clerk, and corporation counsel. There are but few foreign born inhabitants, chiefly Italians. About 100 are colored persons. Pop. (1910) 15,313.

JOHN W. SLAUSON,
Editor of *'Press.'*

Middletown, Ohio, city, Butler County; on the Miami River, the Miami and Erie Canal, and on the Cincinnati, H. & D., the Cincinnati Northern, and the Cleveland, C., C. & St. L. R.R.'s; about 34 miles north of Cincinnati. It was settled about 1794. It is in an agricultural section, but the good water-power has con-

MIDDLETOWN — MIDSUMMER NIGHT'S DREAM

tributed toward making it a manufacturing city. Its principal manufactures are bicycles, agricultural instruments, tobacco products, paper, flour, and dairy products. It has an opera house, a Masonic Temple, public and parish schools, and several fine churches. The city owns and operates the waterworks. Pop. (1890) 7,681; (1900) 9,215; (1910) 13,152.

Middletown, Pa., borough, in Dauphin County; on the Susquehanna River, and on the Philadelphia & Reading and the Pennsylvania R.R.'s; about 10 miles southeast of Harrisburg. It was founded in 1756, and in 1828 was incorporated. It is in a 'arming region, but it has considerable manufacturing interests. The principal manufactures are flour, dressed lumber, leather, foundry products, tubing, stoves, furniture, and cars. Stone quarries in the vicinity contribute to the industrial wealth of the borough. Its trade is in the manufactured articles, farm and dairy products. The borough owns and operates the electric light plant. Pop. (1890) 5,080; (1900) 5,668; (1910) 5,374.

Midgard, *mid'gärd*, in Scandinavian mythology, the dwelling place of the human race, formed out of the eyebrows of Ymir, one of the first giants, and joined to Asgard, the abode of the gods, by the rainbow-bridge.

Midge. See BLACK-FLY; GNAT.

Midhat Pasha, *mid'hät päsh'ä*, Turkish statesman: b. Constantinople 1822; d. Arabia May 1884. He entered the Turkish government service, was made pasha in 1820, was governor successively of Uskup, Bulgaria, and Salonica, and distinguished himself by his wise administration. In 1873 he was for a short time grand-vizier. He aided in deposing the Sultans Abd-ul Aziz and Murad V. in 1876, was grand-vizier under Abd-ul Hamid (Dec. 1876-Feb. 1877), and was then banished by the suspicious monarch. Later, however, he was governor of Smyrna, then of Syria. He was tried with other pashas for the murder of Abd-ul Aziz, was found guilty, and was sentenced to death; but this sentence was commuted to life imprisonment. He wrote 'La Turquie: Son Passé et son Avenir' (1878).

Midianites, *mid'yan-itz*, an Arab tribe, descended, according to Scripture, from Midian, the son of Abraham by Keturah. They occupied most of the country between the Arabian Gulf and the Plains of Moab. The Midianites were very troublesome neighbors to the Israelites till Gideon's victory over them. Midian ceased to be Egyptian and became Turkish in 1887. Consult 'Midian Revisited' (1879).

Midland, Mich., city, county-seat of Midland County; on the Chippewa and Tittabawassee rivers, and on the Michigan Central and the Pere Marquette R.R.'s; about 20 miles west of Bay City. It is in what was once a lumbering region, and its industries are still connected with the products of the forests although in the near vicinity the woods have about all been turned into lumber. Its principal manufactures are shingles, lumber, tubs, hoops, pails, bromine, and salt. Pop. (1910) 2,527.

Midnapur, *mid-na-poor'*, India, a town and administrative district of Bengal. The town is the capital of the district and is 68 miles by rail west of Calcutta. It is the centre of an important indigo and silk industry, and has

manufactures of brass and copper goods. Pop. (1901) 33,140. The district forms the southern part of the Bardwan division, bounded on the east by the river Hugli. It has an area of 5,186 square miles.

Midnight Judges, or Appointments, a term applied to executive appointments or nominations made by President John Adams, the last night of his administration. Congress had passed a bill authorizing the appointment of 18 new United States judges, and Adams with the consent of the Senate appointed judges to fill these newly created vacancies. They were known as 'Adams' Midnight Judges.' The new law was repealed early in Jefferson's term and the judges lost their offices.

Mid'raah (Hebrew, from *darash*, to make research), among the Jews, is the general name given to the exposition or exegesis of the Scriptures. When such writings first arose is not known, but the most flourishing period of mid-rashic exegesis was from about 100 A.C. to 200 A.D. The term midrash expressed 'any and every ancient exposition on the law, psalms, and prophets, disquisitions that took the form of allegorical illustration, homiletics, or practical commentary.' Thus in its most general meaning it expressed the whole uncanonical Jewish literature, including the Talmud, down to the compilation of the book Jalkuth in the 13th century, since which time the term gradually ceased to be applied to rabbinical writings. See HEBREW LITERATURE; TALMUD.

Mid'riff (A.-S. *mid*, middle; *hrif*, abdomen), the diaphragm (q.v.).

Mid'shipman, in the American and British navy, a young officer who has previously held the position of a naval cadet. The cadets require to be nominated before they can come forward for competition. After two years' training on board a training-ship, the cadet is expected to pass the examinations appointed. If he gain a first-class certificate he becomes a midshipman at once, otherwise he has to serve for six to twelve months at sea. A midshipman after four years and a half may become a sub-lieutenant; he then studies at the Naval College, is trained in gunnery and torpedo practice, takes a course in piloting, and then may become a lieutenant.

Midshipman, a Californian coast-fish of the genus *Parichthys*. See CABEZON.

Midshipman Easy, Mr., a nautical romance by Captain Frederick Marryat, published in 1836. It narrates the adventures of a spoiled lad, the son of a so-called philosopher, who cruises about the world, falls in love, has misfortunes and at last good luck and a happy life. The incidents themselves are nothing, but the book is entertaining for its 'character' talk, and because the author has the gift of spinning a yarn.

Midsommer Eve. See SAINT JOHN'S, EVE or.

Midsommer Night's Dream, A, a comedy by Shakespeare, written about 1598. It is spoken of by Meres in his 'Palladis Tamia' (1598) and was entered on the Stationers' Register 8 Oct. 1600. The theme of this joyous comedy is love and marriage. Duke Theseus is about to wed the fair Hippolyta. Lysander is in love with Hermia, and so is Demetrius; though in

MIDWAY ISLANDS—MIFFLIN

the end, Demetrius, by the aid of Oberon, is led back to his first love Helena. The scene lies chiefly in the enchanted wood near the duke's palace in Athens. In this wood Lysander and Hermia, and Demetrius and Helena, wander all night and meet with strange adventures at the hands of Puck and the tiny fairies of Queen Titania's train. An overture 'Midsummer Night's Dream' was composed by Mendelssohn in 1826, and his music for the drama was written in 1843.

Midway Islands, North Pacific Ocean, so named from being midway between Asia and America, are the northernmost islets of the Hawaiian group, extending about 1,800 miles north by west of Honolulu. The islands have come into prominence as the intermediate station of the American-Pacific cable to the Ladrone and Philippine Islands via Honolulu. The group consists of a low coral atoll 18 miles in circumference, enclosing Sand Island, Eastern Island, and two islets. Sand Island, the largest, is $1\frac{1}{4}$ miles long, $\frac{3}{4}$ of a mile wide, and has an average elevation of from three to ten feet above sea-level, the highest point attaining 43 feet. Eastern Island is $1\frac{1}{4}$ miles long, one half mile wide, and from six to twelve feet high. Both islands are partly covered with coarse grass and bushes, the breeding ground of the tern or sea-swallow. Good water is obtained by sinking wells, while fish of many varieties, turtles, crabs and crawfish, etc., abound in the lagoon; sea-birds also are easily caught. The islands are inhabited only by the employees at the cable stations. From 1887-9 a shipwrecked crew lived here for 14 months until rescued, losing, however, several of their number from scurvy. A short distance west of the islands a submarine mountain rises 2,200 feet from the ocean bed to within 82 fathoms of the surface, and between the islands and Guam is an abyss of over 4,900 fathoms, one of the deepest in the world.

Mielziner, mē'l'zīn-ēr, Moses, American rabbi and educator: b. Schubin, Germany, 12 Aug. 1828; d. Cincinnati, Ohio, 18 Feb. 1903. After studying at the University of Berlin, he became rabbi of a congregation in Waren, Germany, and then head of a theological school in Copenhagen. In 1865 he was called to the rabbinate of a New York synagogue, which he held until 1873, when for six years he was principal of a private school besides co-operating in the Emanu El Preparatory School. In 1879 his real educational work was begun in the United States when he was appointed professor of the Talmud at the Hebrew College, which position he held until his death. As teacher he was clear, exact and thorough. His published works include: 'The Jewish Law of Marriage and Divorce' (1884); 'Selections from the Book of Psalms' (1884); 'Slavery among the Ancient Hebrews' (1894); 'Introduction to the Talmud' (1884 and 1903); 'Legal Maxims and Fundamental Laws of the Civil and Criminal Code of the Talmud' (1898); 'Rabbinical Law of Hereditary Success' (1900).

Mieris, mē'ris, Frans van, 'the Elder,' Dutch painter: b. Leyden 12 April 1635; d. there 18 March 1681. He was originally a pupil of

the glass painters A. Torenvliet and G. Dous and eventually became so famous as a canvas artist that the grand-duke of Tuscany, and other noblemen ordered pictures from him; his work was remarkable both for refinement of handling and elegance of design. His portraits and genre pictures, in which both nobility and bourgeois are represented, are not conspicuous for striking and original characterization. Only two or three figures appear in most of his genres, and his compositions of this kind are delicate and smooth to a degree that renders them almost inanimate. There are portraits of himself and his wife in the gallery of The Hague, and in the Pinakothek at Munich, which latter collection is especially rich in examples of this master, among them 'An Oyster Breakfast'; 'Lady Playing a Lute'; 'The Trumpeter'; 'The Sick Woman.' Many of his pictures are to be met with in the galleries of Paris and Dresden such as 'The Artist'; 'A Lady Painting'; 'Love's Message'; 'The Music Lesson'; and in the Berlin Gallery is his 'Young Lady before a Looking-glass.'

Mieris, Frans van, 'the Younger,' grandson of the preceding, Dutch painter: b. Leyden 24 Dec. 1689; d. there 22 Oct. 1763. He painted genre and portraits after the manner of his father, who had produced a number of small club pictures, and of his grandfather. He did more service perhaps by his literary work than by his pictures, which have the ancestral fault of superficiality. He wrote 'Histoire der Nederlandsche Vorsten' (1732-5); 'Groot Charterboek der Graven van Holland, van Zeeland en Herren van Vriesland' (1753-6); and 'Handvesten der Stad Leyden' (1759).

Microslawski, mē-ā-rō-slāw'skē, Louis, Polish general: b. Nemours, France, 1814; d. Paris 13 Nov. 1878. He joined the Polish revolution of 1830; fought with conspicuous zeal; upon the suppression of the movement returned to France; in 1840 was a member of the central committee of the Polish emigration party; and later was identified with the unsuccessful conspiracies of 1846, 1848-9, and 1863. He wrote a 'History of the Polish Revolution' (1837) in French, and political and historical works in Polish.

Mifflin, mif'līn, Lloyd, American poet: b. Columbia, Pa., 15 Sept. 1846. He was educated at Washington Classical Institute and abroad and devoted himself to painting, a collection of which he has exhibited. His health failed and he devoted himself to literature and is the author of: 'The Hills' (1896); 'At the Gates of Song' (1897); 'The Slopes of Helicon and Other Poems' (1898); 'Echoes of Greek Idylls' (1899); 'The Fields of Dawn and Later Sonnets' (1900).

Mifflin, Thomas, American soldier and politician: b. Philadelphia 1744; d. Lancaster, Pa., 20 Jan. 1800. He was by birth a Quaker; was graduated at Philadelphia College in 1760; entered public life in 1772 as a member of the Pennsylvania Assembly; and in 1774 was elected a delegate to the Continental Congress. In 1775 he entered the army with the rank of major, and as colonel and first aide-de-camp to Washington accompanied him to Cambridge. He subsequently held the appointment of adjutant-general, and in the spring of 1776 was commissioned as brigadier-general. He fought in the battle of Long Island, and by his energy

succeeded in the latter part of 1776 in raising considerable reinforcements in Pennsylvania to recruit Washington's army. He was present at the battle of Trenton, and did good service in driving back the enemy's line of cannonments from the Delaware. In 1777 he was made a major-general, and in the same year became an active member of the faction organized for the purpose of placing Gates at the head of the Continental army, and known in history as the Conway Cabal (q.v.). The project failing, he resigned his commission, and in 1782 was elected to Congress, of which body he became president during the following year. In this capacity he received from Washington the resignation of his commission as commander-in-chief. In 1785 he became speaker of the Pennsylvania legislature, and in 1787 he was a delegate to the Constitutional convention. In October 1788, he succeeded Franklin as president of the Supreme Executive Council of Pennsylvania, which position he filled for two years; and from 1790 to 1799 he was governor of the State. In 1794, while holding this office, he rendered important assistance to Washington in quelling the Whiskey Insurrection (q.v.).

Miffin, Warner, American reformer: b. Accomac County, Va., 21 Oct. 1745; d. near Camden, Del., 16 Oct. 1798. When a boy on his father's plantation he became convinced of the evil of slavery, and when he himself became a slave owner, he freed all his slaves and paid them for their past services. He was a Quaker, and traveled widely, preaching against slavery. It was largely through his efforts that the Quakers came to oppose slavery, and many followed his example in freeing their slaves. On account of his religious principles he opposed the Revolutionary War, and at the time of the battle of Germantown, interviewed both General Washington and General Howe to impress upon them the evils of the war. In 1782 he was instrumental in securing a law in Virginia which allowed for emancipation of slaves; in 1783 he presented a memorial to Congress in regard to slavery, and in 1791 another memorial on the same subject to the President and Congress, which was the cause of a sharp debate on the right of petition. Shortly afterward he published a series of essays defending his position in the matter.

Miffin, Fort. See **FORT MIFFLIN**.

Mignard, Pierre, French painter and engraver: b. Troyes November 1612; d. Paris 20 May 1695. He studied in Bourges under Jean Boucher and in Paris under Simon Vouet. In 1636 he went to Italy and spent most of his time in Rome, whence he was surnamed 'The Roman' (Le Romain). He imitated Annibale Caracci, and among other portraits, including those of many Roman nobles, painted likenesses of Popes Urban VIII. and Alexander VII. In 1654 he went to Venice where his success as a portrait painter continued. On being summoned to Paris by Louis XIV. he painted portraits of the young king and of Mazarin and afterward was commissioned to decorate the cupola of the church of Val de Grace with over 200 figures of prophets, martyrs, etc. This work, the largest piece of fresco painting in France, soon lost the beauty of its coloring, owing to the painter's want of familiarity with the art of working on a wet plaster ground. He subsequently pro-

duced some paintings for the palace of Versailles and was made director of the royal art collection and superintendent of the manufacture of the Gobelin tapestry. His pictures suffer from the faults of his day; they are stiff and conventional; but glow with the warm and harmonious coloring of the Venetian school. His portraits are the best of the early French school. A remarkable collection of his works is to be found in the Louvre, but the Berlin Museum possesses the finest of his portraits, that of Maria Mancini. Consult Lebrun Dalbaine, 'Etude sur Pierre Mignard' (1878).

Mignet, François Auguste Marie, frān-swā ögüst mǎ-rē mēn-yā, French historian: b. Aix, Provence, 8 May 1796; d. Paris 24 March 1884. He was educated at Avignon; studied law in Aix; went to Paris in 1822 after winning a prize from the Academy of Inscriptions by his essay on French institutions, government and legislation in the time of St. Louis; joined the staff of the *Courrier Français*; lectured on modern history at the Athénée; was elected to the Academy in 1836; and after the revolution of 1848 lost the place he had held for 18 years as archivist of the Foreign Office. His most important work was a 'History of the French Revolution' (1824). Besides this he wrote biographies of Franklin (1848), of Mary Stuart (1851), and of Charles V. (1854). Consult Trefort, 'Mignet und seine Werke' (1885).

Mignonette, mīn-yō-nēt', a genus (*Reseda*) of annual and perennial herbs of the order *Resedaceae*. The species, of which there are about 50, are natives of western Asia and the Mediterranean region. They have simple or compound leaves, and terminal spikes of small, pale, usually greenish flowers. Less than half a dozen species are cultivated, the most important being the common mignonette (*R. odorata*), a universal favorite both in gardens and in greenhouses because of its fragrant flowers. It is a branching annual herb of decumbent habit when in its prime, and will thrive in any cool, moist, fairly rich soil, when partly shaded from the noon-day sun. For out-door blooming the seeds are sown successively from early spring to midsummer, and for winter blossoming from that time forward at intervals of three or four weeks.

Mignot, mēn-yō', Louis Remy, American painter: b. Charleston, N. C., 1831; d. 1870. He began his studies in Holland in the studio of Schelfhout and returning to New York was elected a National Academician. He left the country during the Civil War and never returned. While he painted portraits, etc., his chief strength lay in the department of landscape. His most notable works are: 'Lagoon of Guayaquil, South America' (1863); 'Evening in the Tropics' (1865); 'Snow in Hyde Park'; 'Sunset off Hastings' (1870); and 'Chimborazo' (1871).

Migraine, or **Megrim** (also called hemicrania and, popularly, sick-headache and nervous headache), an affection marked by a painful headache, neuralgic in character, usually periodical, more or less unilateral, involving one side of the head or of the brow and forehead; and frequently associated with nausea and bilious vomiting. The predisposing causes are chiefly hereditary tendency, anemia, a general

MIGRATION

want of tone, and the nervous temperament. Among the exciting causes are prolonged mental work, mental anxiety or excitement, grief, bodily fatigue, overindulgence, late hours, sexual excesses, and improper food. Treatment requires rest, sometimes in bed; the allaying of pain by anodynes and hot applications, and removal of constipation and other abnormal conditions. In the intervals between the attacks efforts should be directed toward raising the general tone, and especially the strength of the nervous system.

Migration. The migrations of organisms are of two kinds, secular and seasonal. While certain mammals change their feeding grounds to a limited extent, and fishes as well as a very few insects are known to migrate, the habit of seasonal migration is especially characteristic of those birds which breed in the cooler parts of the earth. In the United States and British America nearly all the birds which breed in the central and northern portions fly southward in the autumn, and winter in the Southern States or in Central America, Mexico, and the West Indies. Thus the robin which has reared its young in Maine or Canada, may be seen in March near the timber line on the flanks of Popocatepetl. Most of the birds which breed in northern and central Europe take flight at the approach of cold weather into northern Africa, including Algeria and Egypt. On the other hand the Arctic birds after rearing their broods in high latitudes, seek more temperate climes and more open seas in the winter, where food is more available.

Migration of Birds.—The more typical seasonal migrants are the geese, ducks, shore and wading birds, and the woodpeckers and singing birds. The larger number of tropical birds and many extra-tropical forms, do not migrate. It is probable that in the Tertiary period, or just before the incoming of the Glacial period, when the polar regions were at least semi-tropical in their climate, there were no seasonal migrations. It is a habit which has sprung up since the present climates have prevailed, and is due to the fact that the ground becomes frozen, or covered with snow, so that the food supply is cut off, and storms and blizzards rage, with temperature too low for the existence of the less hardy species.

The routes by which birds migrate to and from their breeding places are quite definite, and lie along the coast lines, mountain ranges, or in great river valleys like that of the Mississippi. In the eastern United States the migrants returning from their winter quarters and seeking their breeding grounds in the north pass along the eastern slope of the Mexican plateau, and cross over from the West Indies. Here the route of travel is divided by the Alleghany ranges into two, one pathway extending along the Atlantic coast, up through New England and the Hudson River Valley; the other passing up the Mississippi, Missouri, and Ohio valleys. Another line of migration follows along the valleys and peaks of the Rocky Mountain ranges; another to the westward up the valley of the Rio Grande; and, lastly, one goes along the Pacific coast. In Europe and central Asia there are numerous routes, at least nine, according to Palmen. Of these one begins on the Siberian shores of the Polar sea, Nova Zembla, and the north of Russia, and passes down the western coast of Norway to the

North Sea and the British Isles; another arising at Spitzbergen follows much the same course, but is prolonged past France and Spain to the west coast of Africa. Many migrants wintering in north Africa (Algeria, etc.) have flown there from northern Russia, by way of the Baltic Sea, Holland, passing up the Rhine Valley, and crossing to the Rhone, the column splitting on reaching the Mediterranean, one line of migration passing along western Italy and Sicily, a second crossing by way of Corsica and Sardinia, the third by southern France and eastern Spain. Egypt receives its winter visitors from the Russian river-valleys of the Obi and Volga, the line crossing the Black, Bosphorus, and Aegean seas to the Nile Valley. Indeed, both in Eurasia and North America the birds follow the easiest and most protected lines of travel, flying in the line of least resistance.

It is supposed that a proportion of the birds fly at high elevations, in some cases at a height of one or two miles, thus passing over beyond ordinary vision. This is on clear and bright nights. In cloudy and stormy weather the birds fly low, and at such times "rushes" occur when great numbers becoming lost and confused dash against the windows of lighthouses. The rate at which birds sometimes fly is very great. If we are to credit Gatzke's estimate. He states that curlews, godwits, and plovers will fly at the rate of about four miles a minute, or nearly twice as rapidly as our swiftest electric carriages. The carrier pigeon, a migrant, is known to fly at an average speed of 36 miles an hour, while in two of them a rapidity of about 55 miles was maintained for four consecutive hours. Of the night- and high-flying migrants we see but little. They are the nocturnal species, such as owls, the goat-suckers, and a large portion of small birds.

Causes of Migratory Movements.—As has been stated the initial cause of the migration of birds breeding in the Arctic and boreal regions was the incoming of the Glacial period and of the present low temperature of the Polar regions where the earth is frozen and snow-clad. The food-supply being cut off in the winter time, they are obliged to fly to regions where worms, insects, and seeds can be had. It is temperature and food that regulate the distribution of animals in general, and also their migratory movements. Newton says that in the North Temperate (holarctic) region every bird is to a greater or less degree migratory in some part or other of its range. Birds are less affected by extremes of cold and heat and other climatic influences than any other vertebrates, "provided only their supply of food is not affected thereby." Competition also comes into play. Birds of prey customarily drive away their offspring from their own haunts as soon as they are able to get their own food, owing to the impossibility of both parents and progeny getting a livelihood in the same vicinity, and this applies to many other kinds. Newton thus accounts for the origin of waves of migration: As food grows scarce toward the end of summer in the most northern limits of the range of a species, the individuals affected thereby seek it elsewhere and thus press on the haunts of other individuals; these in like manner upon that of yet others, until the movement which began in the far north is communicated to the individuals

MIGRATION

occupying the extreme southern range of the species at that season. Other factors are the character or disposition of the species, and its wing power, and more especially the quest for suitable nesting and breeding places. This is satisfactory for the southward movement. It is more difficult to account for the almost unerring instinct or series of reflex activities, if one pleases, which lead the old and young birds to fly back to their birthplace. Is the initiative due to the sexual reflexes and instincts? and after the flocks are once started are they guided by the memory of the landmarks observed in their southward flight in the previous autumn? also does the increasing warmth of tropical regions at the end of winter, for example in northern Africa, Central America and the West Indies, urge them gradually to make their way northward as spring opens? We know that the migratory fishes, the salmon, cod, herring, etc., which live in deep waters in winter gradually as spring arrives and the shallower water becomes warmer, migrate inshore. The change of temperature also affects the sexual organs or glands, the eggs ripen, and this may incite them to seek spawning grounds near shore.

As for the cause which guides them along their accustomed routes, we can see that they are in part mechanical, due to reflex action, thermotropism, etc., and other tropisms, in response to changes of season, etc.; to obvious and safe routes, to the absence of physical barriers, while in fact they are guided by what is called the homing instinct, which is simply the result of observation and memory. If a limpet or crab will find its way back to its station, how much more readily should so keen and intelligent a creature as a bird be able to retrace its flight over a route which it had traveled a few months previous. To invoke a sixth sense, "the sense of direction," seems quite unnecessary considering the bird's keen senses, its power of memory, together with the stimulus of the approaching mating season; hence we need not regard the return migratory flights as especially mysterious. A bee returns to its hive; a cat, dog, or horse travels back long distances to its accustomed haunts, orientating itself by the simple exercise of the acute senses with which it is endowed, plus the memory of land marks observed along the way.

Migrations of other Animals.—Whales, especially the sperm whale, have their regular migrations along the northeastern coast of North America and elsewhere, to and from the polar regions. The barren ground caribou migrates north at the beginning of summer, and southward in autumn. The Arctic fox in the Hudson Bay region is known to retreat southward in October, returning northward in the spring. There are also cases of sporadic and sudden migratory movements by squirrels, lemmings (q.v.), rats, mice, bison, antelopes, quaggas, etc. Among insects the migratory locusts come to mind. The Rocky Mountain locust is migratory in certain seasons favorable to the species when over-production occurs; the young on hatching, after having devoured every green thing at hand, are forced, when becoming winged to rise in enormous swarms and sail on the wings of the wind for hundreds of miles to other regions where they lay their eggs. The next year's brood sometimes returns to the original spawning ground to lay their eggs.

Certain butterflies, as *Anosis plexippus*, and the cotton moth (*Aletia argillacea*) pass northward for hundreds of miles. Among other butterflies periodical migrations occur, as in movements of vast columns across the Isthmus of Panama out to sea, and flights miles in breadth have been observed to cross Ceylon, the individuals occupying several continuous days in their passage. Wallace observed the swarming of pierid butterflies in the Indian Ocean, and Clark in Venezuela, the vast throng composed of males moving steadily eastward for several days in the face of the trade winds.

Human Migrations.—Man probably originated in southeastern Asia at a time when Java was united to the mainland. From thence as he multiplied, and as the result of over-population, waves of migration spread over the highlands and interior of Asia, westward into Europe, and southward into Africa. Probably the North American Indians crossed from northeastern Asia into northwestern America. After the primary races became fixed, the white races of Europe and the Mediterranean region moved in successive waves of secular migration toward the Atlantic. The Anglo-Saxon people, as the result of over-population in the limited area between the mouth of the Rhine and Elbe, have spread over the world. But the yellow races have never passed far west of their present habitat.

Migrations in Geological Times, or Secular Migrations.—Owing to widespread geographical changes in Mesozoic and Tertiary times vast migrations took place. Thus the elephant order which it is now supposed originated in the Eocene epoch in Egypt, emigrated in later times into southeastern Europe and, spreading over Asia, reached North America by way of what is now Bering Strait, then a bridge of dry land, finally passing down in Pliocene times into South America. The camel family originating in western North America, sent waves of migration into South America, and also into Asia. The land-connection between what is now North America, Greenland, Iceland and Europe-Asia, allowed of further migrations and interchanges of mammals and doubtless of the lower animals. For example, in Miocene times America borrowed the bears, deer and cattle from Eurasia, but sent in exchange the tapirs, sabre-toothed tiger, rabbits and hares to what is now the Old World. As soon as the Isthmus of Panama connected North and South America extensive inter-migrations took place. Many of our insects, and birds, and mammals are of South and Central American origin. In the southern land (Antarctogaea) there were most probably during the Mesozoic and Tertiary periods land-connections between South America and Africa, and between Africa and Australia, and possibly there was a great antarctic land connecting these continents, or at least South America and Australia. These movements and migrations were the result of widespread geographical and topographical changes, involving the evolution, extinction and inter-migration of vast assemblages of plant and animal forms.

Consult Newton, article "Migration" in 'Dictionary of Birds' (London 1893-6); also the writings of Baird, Brewster, Cooke, Palmer, etc.

ALPHEUS S. PACKARD,

Late Professor of Zoology, Brown University

Miguel, mē-gēl', Dom Maria Evaristo, Portuguese pretender, son of John VI. of Portugal: b. Lisbon 26 Oct. 1802; d. Castle Brunnbach, Baden, 14 Nov. 1866. He was brought up in Brazil, and upon the accession of his father repeatedly raised rebellion as head of the Absolutists. In 1826 after his father's death he was made regent, but proclaimed himself king, attempted to keep Maria de Gloria, the real heir to the throne, who had been offered to him in marriage, out of the kingdom, and was successful until Dom Pedro of Brazil came to the aid of his daughter Maria, defeated Miguel and forced him to leave Portugal. Miguel is usually described by the faction hostile to him as ignorant, vicious and drunken, but his co-religionists make him a model prince.

Mijatovich, mē-yā'to-vich, Chedomille, Servian statesman and diplomat: b. Belgrade, Servia, 1842. He was educated at the universities of Munich, Leipsic, and Zürich, and in 1865 was professor of political economy at the High College of Belgrade. In 1869 he was general secretary in the ministry of finances and has continued in public life. He has been a senator since 1875, minister of finance, commerce, foreign affairs, delegate to various international conferences and ambassador to England in 1884, to Rumania in 1894 and again to England 1895-1900.

Mikado (Japanese *Mi*, "exalted," *Kado*, "gate"), the ancient and poetic title of the Japanese emperor, in origin identical with "Sublime Porte" as used of the Ottoman sultan, that is, probably transferred to the ruler and judge from the gateway of his palace, at which he did justice. The word mikado was never used as a separate title for a spiritual ruler; the incorrect idea to the contrary results from the well-known historical fact that much of the temporal power of the mikado was long usurped by shoguns or generals, who, however, always admitted that they derived their power from the mikado. The present mikado, Mutsuhito (q.v.), is the 121st (or 123d) of his line, which dates back to 660 B.C.; of him the title "Mikado" is less used than Tenabi Sama, "Son of Heaven," or Shu-jo, "Supreme Master." See JAPAN.

Milan (mil'an) I., Obrenovitch, ô-brēn'ô-vich, king of Servia: b. Jassy, Moldavia, 22 Aug. 1854; d. Vienna 11 Feb. 1901. In 1872 he began to govern as Prince Milan IV. He declared war against Turkey, suzerain power of Servia, in 1876, but was consistently defeated, and gained peace and security only by Russian interference. Having participated in the Russo-Turkish war, Servia was recognized as independent in 1878, and in 1882 proclaimed itself a kingdom, with Milan as ruler. In 1885, upon the union of Bulgaria and Eastern Rumelia, Milan made an invasion of Bulgaria, but was quickly driven back, and defeated at Slivutza in Servia. This time Austria intervened to save his throne. On 6 March 1889 he abdicated and proclaimed his son Alexander king under the regency of himself. In 1892 he renounced the regency and took the title Count Takovo, and in 1898 was made generalissimo of the Servian army, though soon deprived of the post and banished from Servian territory. In 1875 he married Natalie Kechko, daughter of Colonel Kechko of the Russian army, from whom he was afterward divorced.

Milan, mil'an or mil-lān', Italy, the capital of the province of Milan, an archiepiscopal city on the Olona, about 90 miles by rail northeast of Turin. It is situated in a beautiful and fertile plain between the Adda and Ticino, which feed several canals, one of which, encircling a considerable portion of the interior of the city, divides it into two unequal parts. The town is built in the form of an irregular polygon, and is surrounded, except on the castle side, by a wall or rampart called the Bastione, encircled on the outside by a fine road shaded by chestnut-trees. Suburbs have sprung up beyond this circuit, and the general railway-station is also outside. The city is entered by 11 gates, several of which are magnificent. The streets leading from these gates are wide, well paved, and lighted and traversed by electric street car lines; the lateral streets are less commodious. The houses are built mostly of brick, but have often a handsome and showy exterior. The principal street is the Corso Vittorio Emanuele, a prolongation of the new and handsome Corso Venezia, together leading from the cathedral to the Porta Venezia; other good streets are the Corso Porta Romana, Via Torino, Via Dante, etc. The chief square is the Piazza del Duomo, in which stands the Duomo or cathedral; and another is the Piazza della Scala. Besides fine public gardens (Giardini Pubblici) there is a large public park (Parco Nuovo) occupying an area that was long a drill-ground, and was previously the site of the citadel and connected works. This has been finely laid out and planted, and an artificial lake and mound have been constructed. Adjoining these is an amphitheatre, capable of containing 30,000 spectators. The castle—recently restored and now converted into a museum of art and antiquities—fronts the park on one side; at the opposite side is the Porta Sempione with the fine Arco Sempione or Arco della Pace, a triumphal arch of white marble.

Among the public edifices of Milan the first place belongs to the Duomo or cathedral, a magnificent structure, inferior in magnitude to St. Peter's at Rome, but in some respects not an unworthy rival. It is built of white marble, and though exhibiting a somewhat incongruous mixture of styles, in which the ancient Gothic occasionally gives way to the modern Italian, is one of the most impressive ecclesiastical edifices in the world. The Duomo in its present form was commenced in 1387, and is not yet entirely completed. Its form is that of a Latin cross, divided into five naves, terminated by an octagonal apsis, and supported by 52 octagonal pilasters of uniform size, except four, which, having to bear the cupola, are larger. Around the exterior are 4,500 niches, of which above 3,000 are already occupied by statues; in the interior everything is of the most imposing and gorgeous description. Among the other remarkable edifices are the church of Sant' Ambrogio, founded by St. Ambrose in 387, and though completely repaired in 1631, still retaining much of its original form, and containing many relics of the ancient building embedded in its walls; the churches of Sant' Eustorgio, San Lorenzo, Santa Maria della Grazie, with a cupola and sacristy by Bramante, and the celebrated 'Last Supper' by Leonardo da Vinci; Santa Maria della Passione, a majestic edifice, with excellent paintings and a magnifi-

MILAN CATHEDRAL

MILAN — MILAZZO

cent mausoleum; San Paolo; San Carlo Borromeo, etc. Among the palaces are the Palazzo Reale or La Corte, adorned with numerous frescoes and surmounted by a lofty tower; the archiepiscopal palace, adjoining the cathedral; the Palazzo di Comando Militare; the Palazzo Marino, now the Municipio, a colossal structure; the Palazzo Ciani, completed in 1861, and adorned with heads of Victor Emmanuel, Garibaldi, etc.; and the Palazzo di Brera or Delle Scienze Lettere ed Arte, containing the Pinacoteca or picture-gallery, with a very valuable collection of paintings and statuary, and containing also the library of the Academy, 300,000 volumes. Besides this library Milan possesses the Ambrosian Library, the earliest, and still one of the most valuable public libraries in Europe. There is also a valuable museum of natural history, a conservatory of music, a military college, a theological seminary, and a veterinary school. The principal structure erected in recent times is the Galleria Vittorio Emanuele, a kind of covered street connecting the Piazza del Duomo with the Piazza di La Scala Theatre. It is 320 yards long, contains handsome shops, and is adorned with 24 statues of celebrated Italians. Milan has a number of theatres, among which that called La Scala takes precedence, accommodating 3,500 spectators. The principal benevolent endowments are the Ospedale Maggiore, richly endowed, and occupying a vast range of buildings in the Gothic style, with accommodation for 2,000 patients; several other hospitals for the cure of diseases, or the reception of the poor; and a vast lazaretto just outside the rampart. Since it formed part of United Italy no town has more rapidly increased in commercial and industrial activity than Milan. The spinning and throwing of silk employ a large number of hands. Other important articles of manufacture are machinery, locomotives and railway cars, boilers, electrical apparatus, tobacco, cotton, lace, carpets, hats, earthenware, white-lead, jewelry, etc. Besides these, corn, rice, cheese, and wines are the principal articles of trade. It is the see of an archbishop, the seat of courts of primary resort, criminal and mercantile courts, and a court of appeal for all Lombardy. The United States is represented by a consul.

The foundation of Milan is attributed to the Insubrian Gauls; but the first distinct notice of it occurs 221 B.C., when it was subdued by the Romans, under whom it acquired so much importance, that in the division of the empire attributed to Constantine the Great it ranks as the second city of Italy. In the middle of the 5th century it was sacked by the Huns under Attila, and again in the following century by the Goths. Greater horrors yet awaited it; and the Goths, who had been driven out by Belisarius, having regained possession by the aid of the Burgundians, gave it up to the flames, and put almost all its inhabitants to the sword. Having been rebuilt it again became very flourishing under the Lombards and Charlemagne. Arrogance grew with its prosperity, and Milan lorded it so haughtily over the neighboring towns and republics, that in 1162, when the Emperor Frederick I., whose supremacy it refused to acknowledge, had resolved to take summary vengeance, the inhabitants of Pavia, Cremona, Lodi, Como, and Novara eagerly hastened to the task, and razed it to the ground. The cru-

elties practised produced a reaction, and in 1167 the famous Lombard League was formed at Pontusa, and among other important results succeeded in bringing back the Milanese; and the city again rebuilt became even more populous and influential than before. It long continued, however, to be torn by internal factions, headed by the leading nobility, among whom the Visconti at last gained the ascendancy, and ruled it from 1395 till 1447. They were succeeded by the Sforzas, whose rule ended in 1535. Milan passed next into the possession of the Spaniards. At the close of the war of Succession it was allotted to Austria (1714). Under Bonaparte it became the capital of the Cisalpine Republic, of the Italian Republic, and of the Italian Kingdom. In 1815 it was restored to Austria, and continued the capital of the Austro-Italian Kingdom until 1859, when by the Peace of Villafranca Lombardy was ceded to Piedmont. Pop. about 500,000.

Milan, mī'lan, Mo., town, county-seat of Sullivan County; on the Quincy, O. & K. C. and the Chicago, B. & K. C. R.R.'s; about 100 miles east by north of Saint Joseph. It is in an agricultural and stock-raising region, and in the vicinity of bituminous coal fields. The chief manufactures are flour and lumber. Milan is the headquarters of a division of the Quincy, Omaha & Kansas City railroad, and the shops of the road are located here. The trade is principally live-stock, grain, lumber, and flour. Pop. 2,000.

Milan, Tenn., city in Gibson County; on the Illinois Central and the Louisville & N. R.R.'s; about 95 miles northeast of Memphis. It is in an agricultural and lumbering region; the principal products are cotton and fruit. The chief manufacturing establishments are flour-mills, fruit-canning works, cotton gins, and barrel factory. It has a college and good schools. Pop. 1,700.

Milan Decree, issued by Napoleon I., at Milan, 18 Feb. 1801, cutting off Great Britain from all connection with the Continent.

Milan Edict, issued by Constantine the Great at Milan, 313 A.D., granting toleration to Christianity and all other religions in the Roman empire.

Milanés y Fuentes, José Jacinto, hō-sā' yā-kén'tō mē-lān'ās ē fwān'tās, Cuban poet; b. Matanzas 16 Aug. 1814; d. there 14 Nov. 1863. He was self-taught, being a poor clerk and later a blacksmith's helper. But when he was 19 some of his verses were published, and his excellent drama, 'El Conde Alarcos,' which appeared in 1838, won him a comfortable position. Several other plays followed, notably 'Una Intriga paternal.' But his early hardships had undermined his reason; he traveled for relief in the United States and in Europe in 1848 and 1849, and spent his last years in melancholia broken only occasionally by intelligent literary effort. Consult the biographical sketch in the 'North American Review' for 1849.

Milazzo, mē-lāt'sō, or Melazzo, Sicily, a fortified seaport city in the province of Messina, on a promontory 21 miles by rail west of Messina. It has a good harbor and carries on a trade in fruit, wine, cattle, fish, and sulphur. Milazzo is the ancient Mylae off which in 260

MILBURN—MILEAGE

n.c. the Romans won a great sea-fight over the Carthaginians. Here also Garibaldi, 20 July 1860, with 2,500 men, defeated 7,000 Neapolitans, and compelled the garrison to evacuate the fortress.

Milburn, William Henry, American clergyman: b. Philadelphia 26 Sept. 1823; d. Santa Barbara, Cal., 10 April 1903. At 5 he suffered an accident which caused partial and finally complete loss of sight. He was educated at Illinois College (Jacksonville, Ill.); in 1843 became a Methodist itinerant preacher; was largely active in the South; and for a time had charges at Montgomery and Mobile, Ala. In 1845 he was elected chaplain of the House of Representatives, and he served as such in 1853, 1885 and 1887. In 1893 he was made chaplain of the Senate. He lectured with success throughout the United States and in 1899 in Great Britain. He was generally known as the "blind preacher." Among his writings are: 'Rifle, Axe, and Saddle-Bags' (1857); 'Ten Years of Preacher Life' (1859); and 'Pioneers and People of the Mississippi Valley' (1860), all based on his Western experiences.

Mildew, specifically, any fungus belonging to the group *Erysiphaceae*, the powdery or true mildews, and *Peronosporaceae*, the downy or false mildews; loosely, many plant diseases, especially the rusts and smuts of cereals, and some not of fungous origin; vaguely, molds of any kind upon preserved fruit, clothing, walls, or other materials, the origin of which is more or less organic. The powdery mildews develop mostly upon the outside of the host plants, which they enter only by means of their sucking organs of attachment (haustoria). In warm weather they develop innumerable spores upon erect branches and later produce thick-walled resting spores which germinate in the spring. Upon the host plants they usually appear as a sort of bloom, but later they often cause distortion of the leaves and not infrequently the death of the host. Being mainly upon the surface they may be combated with any fungicide (q.v.), and often with sulphur, either in the form of powder or vapor (not burned) evaporated without flame. This method is widely practised in greenhouses. Some of the best known are rose mildew (*Sphaerotheca pannosa*), gooseberry mildew (*S. mors-uva*), hop mildew (*S. castagnei*), cherry, pear and apple mildew (*Podosphaera oxycantha*), wheat mildew (*Erysiphe graminis*), and grape mildew (*Uncinula spiralis*).

The downy mildews all live within the tissues of the host plant, appearing outside the surface only when producing summer spores (conidia) which usually give a downy appearance to the infected spots. The resting spores are produced internally and make their escape in the following season when the tissues of the host (leaf or other part infected) have decayed. They cannot be combated like the preceding, because of their habit of feeding internally. Fungicides (q.v.) may be applied to prevent attacks, however, and this, together with the destruction of leaves in autumn and general cleanness of the premises are believed to be the only safeguards. Among the best known and most destructive are: Potato rot, blight, or mildew (*Phytophthora infestans*), lettuce mildew (*Bremia lactuca*), damping-off fungus

(*Pythium debaryanum*), downy mildew of the grape (*Plasmopara viticola*), radish mildew, also found on other members of the *Cruciferae* (*Cystopus candidus*), melon and cucumber mildew (*Plasmopara cubensis*) and onion mildew (*Peronospora schleideniana*).

The rusts and smuts which are sometimes called mildews are discussed elsewhere. The mildews, so-called, which appear upon leather, wall-paper, cloth, etc., belong to various other groups. Since they are generally seen only where dampness prevails, especially in cellars and closed rooms or houses, they may be prevented more or less effectually by the adequate ventilation of such places. And having gained a foothold in these places they may be destroyed by liberal applications of whitewash, in which copper sulphate or sulphur have been mixed, or where this cannot be applied, by burning sulphur in the closed quarters. This last remedy may also be used where cloth is attacked. Awnings, sails, etc., should be thoroughly dry before being stored or folded for any considerable time. They may also be soaked in a solution of copper sulphate and then dried. Until this is washed out by rain it will act both as a preventive of attack and will often save fabrics if not too far gone.

Mile (Latin *mille*, a thousand, a Roman mile being 1,000 paces), a measure of length or distance. The English statute mile, fixed in the reign of Queen Elizabeth, is 1,760 yards. The geographical mile, which is commonly used by the navigators of all nations, is one sixtieth part of a degree at the equator. In many countries the kilomètre (kilometer) now holds the same position as the English statute mile in Britain. The following are some of the principal standards of miles or leagues which are or have been in use in the principal countries of Europe:

Kilomètre	1,093.6 yards.
Ancient Roman mile	1,475 "
Modern Roman mile	1,475 "
English statute mile	1,760 "
Tuscan mile	1,808 "
Ancient Scottish mile	1,844 "
Geographical mile	2,025.4 "
Italian mile	2,025.4 "
Irish mile	2,240 "
French posting league	4,263 "
Spanish league (judicial)	4,635 "
French league	4,860 "
Portuguese league	5,760 "
German short mile	6,399 "
Flanders league	6,884 "
Spanish league (common)	7,416 "
German geographical mile	8,113.6 "
German (new imperial)	8,202 "
Old Prussian mile	8,237 "
Danish mile	8,244 "
Swiss mile	8,153 "
German long mile	10,126 "
Swedish mile	11,700 "

The English statute mile is generally used in the United States.

Mileage, a term used in the United States, for fees paid to certain officials, such as members of Congress, of State legislatures, special commissioners and others, for their traveling expenses, at so much per mile. The system has led to gross abuses, each senator and representative estimating for himself the distance he had traveled. There is now a fixed table of mileage, and the total annual cost, for both houses of Congress, is nearly \$150,000. In all countries of Europe, except Great Britain, the same system prevails with regard to members of the popular chambers, at least, they being

MILELLI—MILETUS

paid either their traveling expenses or a fixed annual sum. The term mileage is also applied in the United States to railroad transportation, sold in tickets good for 1,000 miles of travel. These tickets are issued in book form, convenient for the pocket, and are known to travelers as mileage books. In 1903, a system of interchangeable mileage tickets were issued, good for transportation on any one of eight different railroad lines in the Eastern States.

Milelli, Domenico, dō-mā'nē-kō mē-lē'lē ("CONTE DI LARA"), Italian poet: b. Catanzaro, Italy, 1841. He was educated for the priesthood, but finding literature more to his liking turned his attention to writing, which is in subject of a paganish character, and he is one of the leaders of the class called *Veristi*. Among his works are: 'In giovinezza' (1873); 'Odi pagane' (1879); 'Il rapimento di Elena' (1882); 'Verde antico' (1885).

Miles, George Henry, American dramatist: b. Baltimore, Md., 31 July 1824; d. Thornbrook, Md., 23 July 1871. He was graduated from Mount St. Mary's College, Emmitsburg, Md., and practised law in Baltimore for several years, after which he devoted himself to literature. In 1850 his 'Mohammed' was awarded the \$1,000 offered by Edwin Forrest for the best drama by an American author. In 1859 he was appointed professor of English literature at Mount St. Mary's College, where he remained until his death. His works comprise: 'Señor Valiente' (1859); 'Christine, a Troubadour's Song' (1866); 'Abu Hassan the Wag' (1868), etc.

Miles, Nelson Appleton, American army officer: b. Westminster, Mass., 8 Aug. 1839. He was a clerk in a Boston mercantile house at the outbreak of the Civil War in 1861; and left his business to raise a company of volunteers, and enter the army as lieutenant in the 22d Massachusetts regiment. In 1862 he was promoted to the rank of colonel, commanding the 61st New York regiment. He was engaged in the battles of the Peninsula, before Richmond, and at Antietam, and in every battle of the Army of the Potomac, with one exception, until the surrender of Lee at Appomattox Court House. He was distinguished in the battles of Fair Oaks, Malvern Hill, Fredericksburg, Chancellorsville, Wilderness, Spottsylvania Court House, Reams Station, Richmond Campaign of 1864, and many other important battles of the war; and, at one time, at the age of 25, was in command of the Second army corps, numbering 25,000 men. He was wounded three times, most severely at the battle of Chancellorsville. In May 1864 he was promoted brigadier-general, and in 1865 major-general of volunteers.

At the close of the war he entered the regular army and was commissioned colonel of the 40th United States infantry; and attained the rank of brigadier-general in 1880, and of major-general in 1890. He successfully conducted several important campaigns against the Indians, and did much to open up for civilization large portions of the West. In 1874 and 1875 he defeated the Cheyennes, Kiowas, and Comanches in the Staked Plains country; he also subjugated the hostile Sioux and other Indians in Montana, driving Sitting Bull across the frontier and breaking up the bands that

were led by him and other chiefs. In December 1877, after a forced march over a distance of more than 160 miles, he captured Chief Joseph and his tribe of Nez Percés after a hard-fought battle of four days in northern Montana; in 1878 he intercepted and captured Elk Horn and his band on the edge of the Yellowstone Park. In 1886 he subjugated and forced to surrender Geronimo, Natchez and the band of Apaches that had made a large portion of the Southwest uninhabitable, thus restoring peace and prosperity to Arizona and New Mexico. For his services up to this time he received the thanks of the legislatures of Kansas, Montana, New Mexico and Arizona. Later he settled the Indian troubles in the Dakotas, saving the country from a serious war that had threatened it for years. In 1894 he was in command of the United States troops sent to Chicago at the time of the railroad strike; and in October 1895 succeeded to the command of the United States army. He represented the army at the scene of the Turco-Grecian war, and at Queen Victoria's Diamond Jubilee in 1897. In 1898 he conducted the brief campaign in Porto Rico with ability, taking possession of the island with trifling loss; and in June 1900 was promoted to the rank of lieutenant-general. In December 1901 he was officially reprimanded for publicly expressing his approval of Admiral Dewey's report on the Schley case. In 1902 he made a tour of inspection to the Philippines, and on his return filed a report which called forth considerable controversy by its denunciation of some of the abuses he had found in the conduct of military affairs there. In August 1903 he was retired from active service. He has written 'Personal Recollections' (1896); 'Military Europe' (1898), besides magazine articles and official military reports.

Miles O'Reilly. See HALPINE, CHARLES GRAMAM.

Milesians, mī-lē'shī-anz, or mī-lē'zhanz, early colonists of Ireland, a portion of whose inhabitants, according to Irish tradition or legend, are descended from Milesius, a fabulous king of Spain, whose two sons conquered the island several thousand years before Christ, establishing a new nobility. This was the last of the traditional prehistoric colonizations of Ireland.

Miletus, mī-lē'tūs, Asia Minor, an ancient city opposite the mouth of the Meander on the Latmic Gulf, which, inhabited by Carians, was in existence prior to the colonization of the coast by the Ionians. The Ionians are said to have taken forcible possession of the town, massacred the men, and taken the women as their wives. The extent of the harbors of Miletus, one of which could contain a large fleet, soon raised the town in the hands of the Ionians to a place of importance, and it became one of the first cities and republics of Asia Minor. Its commerce covered the Mediterranean, and extended to the Atlantic. It had upward of 75 colonies, most of which were on the coasts of the Euxine. On the rise of the Lydian kingdom repeated attempts were made to conquer it. It finally recognized the sovereignty of Croesus, and paid tribute. A similar arrangement was made with Cyrus, which saved it the calamities of a contest with the Persians. Civil dissension, however, had long been rife. The Persians

MILFOIL—MILFORD

were compelled to intervene, and committed the government to the most peaceable land-owners. The city revolted against the Persians 500 a.c. It was taken by storm 494 a.c., was plundered, and the inhabitants massacred or transported. It recovered its independence in 479 a.c., after the battle of Mycale. It yielded for a time to the supremacy of Athens, but ultimately threw off the yoke. It stood an assault by Alexander the Great 334 a.c., part of the city was destroyed, but the conqueror did not interfere with its government. From the time of its subjugation by the Persians it had never recovered its early importance, but it still continued to enjoy some commercial prosperity under the Romans until the time of St. Paul, who visited it twice, as recorded in Acts xx. 17 and 2 Tim. iv. 20. It was finally taken and destroyed by the Turks. From the change made on the coast by the deposits of the river the site of the city was with difficulty excavated by the Berlin Museum in 1899, and the foundations of various parts of the city exposed.

Mil'foil, or Millefoil. See YARROW.

Milford, mil'förd, Conn., town, in New Haven County; at the mouth of Wepowaug River, on Long Island Sound, and on the New York, N. H. & H. railroad; about 10 miles southwest of New Haven. The place was settled by people from Wethersfield and New Haven in 1639. The Indian village was called Wepowage. Milford became a part of the "Colony of New Haven" in 1644, and in 1664 the town became a part of Connecticut. The chief industries are oyster cultivation, farming, seed-growing, the manufacturing of electrical supplies, telephone apparatus, shoes, straw hats, and silverware. It has a beautiful, well-kept park, several fine churches and school buildings, and the Taylor Library, which has about 10,000 volumes. In 1889, on the 250th anniversary of the settlement of Milford, a Memorial Bridge was erected. Pop. (1910) 4,366.

Milford, Del., town, in Kent and Sussex counties; on Mispillion River, and on the Philadelphia, B. & W. railroad; about 62 miles south of Wilmington. A settlement was made herein 1678-9 and in 1787 the town was incorporated. It is the trade centre for a fertile agricultural region in which fruit growing receives special attention. The industries of the town are connected with the farm and orchard products. Pop. (1910) 2,603.

Milford, Mass., town, in Worcester County; on the Charles River, and on the New York, N. H. & H. and the Boston & A. R.R.'s; about 17 miles southeast of Worcester. It was settled in 1669 and was then a part of the East Precinct of Mendon. On 11 April 1780 it was incorporated as a separate town. It is in an agricultural region, but the town has considerable manufacturing interests. In the vicinity are large granite quarries. The chief manufactures are foundry and machine-shop products, silk, boots and shoes, thread, boot and shoe trees, straw goods, and bone cutters. The granite quarries contribute to the industrial wealth of the town. The town has a fine high school, good public and parish schools, and a public library. Town meetings, held usually twice a year, administer the government. Pop. (1910) 13,055.

Milford, N. H., town, in Hillsboro County; on Souhegan River, and on the Boston & M. and the Fitchburg R.R.'s; about 27 miles south by west from Concord, and 15 miles southwest of Manchester. The chief industries are connected with manufacturing, quarrying granite, lumbering, and agriculture. The principal manufactures are flour, leather, lumber, piano keys, harnesses, furniture, quarry machinery, soap, paper boxes, wagons, and carriages, and dairy products. The trade is in the manufactured articles, farm products, and granite. Pop. (1910) 3,939.

Milford, Pa., town, county-seat of Pike County, on the Delaware River, and on the Erie railroad; about 45 miles east of Scranton and 8 miles southwest of Port Jervis. It is situated in a portion of the Delaware Valley noted for its beautiful and picturesque scenery. The Sawkill Falls and the Cliffs are in the vicinity, and on the northwest and south of the town are mountains. Three miles south are the falls of the Raymonds Kill and 14 miles south are the cataracts of Big and Little Bushkill creeks. Milford is one of the pre-Revolutionary places, but it was not made a separate township until 1800. It is a favorite resort for hunting parties. Many of the legends and stories connected with the place may be found in 'Pike County Ballads,' by E. Mott. Pop. about 900. In summer the population is over 6,000.

Milford, Wales, a seaport town of Pembrokehire on the celebrated Milford Haven, one of the safest, deepest, and most capacious harbors in Britain, forming a deep indentation in the southwest coast of the county. The haven stretches about 10 miles from east to west, with a breadth of from one to two miles, and branches off into numerous bays, creeks, and reaches. The largest vessels can enter and put to sea in any wind or at any tide more expeditiously than from almost any other large harbor in Great Britain, and it has long been proposed to make Milford the eastern seat of the transatlantic trade, as bringing London nearer by several hours. The haven is defended by fortifications. The town of Milford on the north shore, eight miles northwest of Pembroke and six miles from the mouth of the haven, has extensive modern docks and a busy agricultural and domestic trade with Irish ports. Pop. about 6,000.

Milford, Engagements at. Milford, Va., on the east bank of the south branch of the Shenandoah, was the scene of several skirmishes and three cavalry engagements during the Civil War. On 24 June 1862 detachments of the 1st Maine and 1st Michigan cavalry attacked about 300 mounted Confederate infantry at the place, without decisive result, and withdrew. When Sheridan, after the battle of the Opequon (q.v.), followed Early up the valley, he ordered Gen. Torbert, commanding the cavalry, up the Luray Valley, to get past Early's right and cut off his retreat. Wilson's division advanced and 21 Sept. 1864 attacked Wickham's cavalry division of two brigades and drove it from Front Royal and up the valley to Milford, where Wickham took up a strong defensive position on the south side of Milford Creek, one flank on the Shenandoah and the other on a knob of the Blue Ridge. When Torbert came up on the 22d he

MILFORD—MILITARY ACADEMY

concluded that the position was too strong to be attacked, and not knowing that Sheridan had attacked Fisher's Hill (q.v.) fell back to near McCoy's Ferry, again advancing, and on the 23d occupying Milford, which had been abandoned by Wickham. Sheridan was greatly disappointed at Torbert's failure to carry the place on the 22d. After the battle of Cedar Creek (q.v.) 19 Oct. 1864, Milford was occupied by Lomax's Confederate cavalry division, and its defenses strengthened. On 24 October Powell's cavalry division, two brigades of about 1,100 men, with six guns, moved up the Luray Valley to reconnoiter. Powell skirmished with Lomax's outposts on the 25th, and on the morning of the 26th attacked Lomax in position at Milford, using his artillery freely, and continuing the contest until 2 p. m., when, finding the defense so stubborn and the position too strong to be carried, he withdrew.

E. A. CARMAN.

Milfort, Le Clerc, lē klārk mēl-fōr, or mīl-fōrt, French adventurer: b. Mezières, France, about 1750; d. there 1817. He came to America, traveled through the colonies, and about 1776 visited the Creek Indian nation. Here he attached himself to the Creek chieftain, Alexander McGillivray, whose sister he married. He was made a war chief by the Indians, was called Tastanegy, or "great warrior," and was in active service against the Whigs of Georgia during the Revolution. He remained with the Creeks for 20 years. In 1796 he returned to France, and was made a general of brigade by Bonaparte. He wrote, or perhaps merely furnished material for, the interesting 'Mémoires, en Coup-d'œil Rapide, sur mes Voyages dans la Louisiane, et mon Séjour dans la Nation Creeke' (1802).

Miliaria (MILIARY FEVER, MILLET-SEED RASH, PRICKLY HEAT), a very common fine papular or papulovesicular eruption. It is caused by too profuse sweating attended by undue congestion of the skin. Hot weather, excessive clothing, vigorous exercise, alcoholic dissipation commonly evoke the disease, especially in those who are debilitated or who have a delicate skin. It may appear and disappear rapidly without any apparent cause. Its appearance is attended by pricking, burning, or itching sensations. It is generally limited to a portion of the trunk, but may appear upon the face, neck, and extremities. Fresh crops may follow one another. In subsiding the vesicles become opaque and yellowish white.

Miliary Fever. See MILIARIA.

Milica, mē'lich, or **Militz, Johann**, Moravian reformer: b. Kremsir, Moravia, about 1325; d. Avignon, France, 29 June 1374. He entered the Roman Catholic priesthood in 1350 and in 1360 became canon at the Cathedral of St. Vitus in Prague, and was appointed secretary to Charles IV., who took him to Germany. Becoming convinced of the hollowness of court and church life, in 1363 he resigned and began to preach to the lower classes in Prague in their own tongue, instead of the Latin, and gained over them a wide influence. Convinced that Antichrist had arrived and that the day for reform was at hand, he went to Rome that he might consult the pope, and was arrested by the Inquisition, but was released, and was well received by Urban V. Upon his return to

Prague he resumed his preaching, but in 1373 he was accused of heresy by his brother priests and summoned to Avignon for trial. He proved his innocence, but died before the verdict was rendered. Consult Palacky, 'Die Vorläufer des Hussitentums' (1869).

Military. See ARMY; ARMY OF THE UNITED STATES.

Military Academy, Royal, an institution at Woolwich, England, where candidates for the Royal Engineers and the Royal Artillery of the British army receive their finishing education. See MILITARY SCHOOLS.

Military Academy, United States. From the first outbreak of the War of the Revolution the necessity for trained artilleryists and engineers was manifest. The want was supplied so far as possible by importing foreigners, chiefly Frenchmen. It was evident from the first also that the United States should maintain a school for educating Americans for command and especially for the regular duties of the scientific branches of the service. Two plans were suggested; the first was to establish a military academy with a fixed home, where pupils (cadets) would be educated chiefly in the theory of war, leaving the practice to be gained in actual service; the second was to organize a school of practice for young officers who would also study the theory of their profession. General Henry Knox, chief of artillery, was the first to propose the former plan which is that on which the United States Military Academy is organized. In a report to a committee of Congress (27 Sept. 1776) he advocated an Academy "nearly on the same plan as that of Woolwich." Knox's views were afterward supported by Alexander Hamilton, and approved by General Washington. The plan of Knox was not carried out until 1802 when the United States Military Academy was established at West Point. The alternative plan was adopted in 1777.

The occupation of West Point as a military post took place 20 Jan. 1778, and has been continuous since that date. As early as 1 Oct. 1776, Congress passed a resolution appointing a committee to prepare a plan for "A Military Academy at the Army." The result was the resolution of 20 June 1777, providing for a Corps of Invalids (veterans) "to serve as a military school for young gentlemen previous to their being appointed to marching regiments." The Invalid Corps was organized in July 1777, and in 1781, at the request of Washington, was marched from Philadelphia to form part of the garrison at West Point, where an engineer school, a laboratory, and a library had been established in three separate buildings. In 1783, after the cessation of hostilities, Washington, having been called upon for his views as to the peace establishment, laid the matter of a Military Academy before his officers at Newburg. He referred to it again in his message of 3 Dec. 1793. The law of 9 May 1794 authorized the organization of a Corps of Artillerists and Engineers with two cadets to a company, thus creating the new grade of "cadet" in the American army. A school for the artilleryists and engineers and for the cadets attached to them was established, on the recommendation of Washington, by order, at West Point, in 1794. The destruction of its buildings by fire in 1796, however,

MILITARY ACADEMY

caused its suspension. On 20 July 1801, the Secretary of War directed that all the cadets of the corps of artillery should report at West Point for instruction, and on 1 Sept. 1801 a school was opened with four army officers and a civilian as administrators and instructors.

Washington was firmly convinced of the necessity of establishing a Military Academy, and it was due to his efforts, and those of other patriots of the Revolution that the Academy was created by Act of Congress approved 16 March 1802. The Act authorized the President to organize and establish a Corps of Engineers to consist of five officers and ten cadets and provided that it should be stationed at West Point, in the State of New York, and should constitute a Military Academy. The Academy, with ten cadets present, was formally opened 4 July in the year of the Act.

Acts of Congress, in 1802 and 1808, authorized 40 cadets from the artillery, 100 from the infantry, 16 from the dragoons, and 20 from the riflemen; but few of these were appointed, and no provision was made for them at the Academy. In 1810 the Academy was deprived of nearly all means of instruction, and officers and cadets had difficulty in obtaining their pay. During most of the year 1811, and a part of 1812, although war was imminent, academic instruction was practically abandoned. In March 1812 the Academy was without a single instructor. Up to and including this time, 88 cadets had been graduated; they had entered without mental or physical examination, at all ages from 12 to 34, and at any time of the year.

By Act of Congress of 20 April 1812, the Academy was reorganized. The provisions of this Act have furnished the general principles upon which the Military Academy has since been conducted and controlled; a more adequate corps of professors was authorized; a maximum of 250 cadets was fixed; and the age and the mental requisites for admission were prescribed.

In 1817, under the provisions of the Act of 1812, and the able superintendency of Major Sylvanus Thayer, Corps of Engineers, the present era in the Academy's history began.

Until 1843, a prescribed residence was not a legal qualification for appointment, but the selection of one cadet from each Congressional district had grown to be customary. In this year the custom became the law, Congress prescribing that the corps of cadets should consist of one from each Congressional district, one from each Territory, one from the District of Columbia, and ten from the United States at large, to be appointed by the President.

By Acts of Congress approved 6 June 1900, 28 June 1902, and 3 March 1903, the Corps of Cadets consists of one from each Congressional district, one from each Territory, one from the District of Columbia, one from Porto Rico, two from each State at large, and forty from the United States at large, all to be appointed by the President and, with the exception of the forty appointed from the United States at large, to be actual residents of the Congressional or Territorial districts, or of the District of Columbia, or the States, respectively, from which they are appointed. Under these Acts, and under the apportionment of Members of Congress according to the 12th census, the maximum number of cadets is 522.

The total number of graduates from 1802 to 1903, inclusive, is 4,214.

Under Thayer, the Academy assumed a form which has remained essentially unchanged for nearly a century. The heads of the scientific departments (mathematics and the like) are permanent, of the professional departments (ordnance and the like) are detailed from the Army for a term of four years. The instructors in all departments are army officers detailed for the purpose—about one instructor to ten cadets. All cadets follow the same fixed curriculum and all graduates are prepared for the duties of all arms of the service therefore—a peculiarity of this school. The cadets are divided into small sections for instruction, and each is called upon to recite every day. The instruction is therefore unusually thorough, so far as it goes. A "mark" is given for each recitation and the sum of a cadet's marks determines his standing in his class. Upon this standing his first promotion in the army depends. The upper men of each class—five or more—are assigned, upon graduation, to the Engineers, the next to the Artillery, the lower half of the class to the Cavalry or Infantry. All have, however, been educated to the duties of every branch and the high excellence of the American army officer depends upon this fact.

The first object of the school is to form character. Habits of faithfulness, promptness, cheerful obedience, attention to duty first, last and all the time, are insisted on. The whole conduct of each cadet is registered by "demerit marks." Small privileges are granted for good conduct. Small punishments—such as confinement to quarters—are given for offenses. The punishments follow closely on the offense. The cadet adjusts his standard of conduct to the regulations of the Academy precisely as a child adjusts its conduct to the law of gravity. There are, for example, some 18,000 opportunities for a cadet to be late at roll call during his stay at the Academy. For every "late" he will receive one demerit. If he receives 215 for all offenses in any 12 months he is discharged. Promptness thus becomes a fixed habit, and other practical virtues are inculcated in the same way. A high standard of truthfulness and honor is insisted upon, which in the officer becomes a standard of honesty. The record of graduates in this respect is extraordinarily bright.

The services of the graduates in war are well known. Speaking of the Mexican War, General Scott said: "I give it as my fixed opinion that but for our graduated cadets, the war between the United States and Mexico might, and probably would, have lasted some four or five years, with, in its first half, more defeats than victories falling to our share; whereas, in less than two campaigns, we conquered a great country and a peace, without the loss of a single battle or skirmish."

Two hundred and ninety-one of the 4,000 graduates have become general officers. Every great battle of the Civil War except two was fought under the command of a graduate. The Army Register of 1861 contains the names of 753 graduates on the active list; 150 joined the army of the Confederacy—about 20 per cent. Nearly one half of the army officers appointed from civil life did so, and almost all the United States Senators, Representatives, Judges and civil officials appointed from Southern States.

REVIEW FOR THE PRESIDENT OF THE UNITED STATES.

GUARD MOUNT—DAILY MORNING INSPECTION OF DETAIL FOR SENTRY DUTY. •

DRILL EXERCISES AT WEST POINT—DRESS PARADE

MILITARY ARCHITECTURE—MILITARY COURTS

The loyalty of the graduates of the United States Military Academy in that trying time, measured by percentages of the sort, was far greater than that of any other group of men except the graduates of the Naval Academy, whose record in this respect is nearly, though not quite, as good as that of the United States Military Academy. The work of the graduates in the Spanish-American War of 1898 and in the China Expedition of 1900 was admirable in every respect.

The services of graduates in civil life have been equally brilliant. In the early days of the Academy it was the chief engineering school of the country. Its graduates surveyed and located the principal railway routes and afterward constructed the roads not only of this country, but of Russia and South America. Our rivers have been improved by their skill. Harbors and light-houses built by them make the navigation of our seas and lakes secure. The public domain is divided into homesteads and the coasts are surveyed by systems devised by professors in this school. Graduates in civil life have given to the country a President, four cabinet officers, one ambassador, 14 ministers to foreign courts, 12 consuls-general, 24 senators or representatives, 16 governors of States or Territories, 77 members of State legislatures, 158 officers of State militia, 17 mayors of cities, 46 presidents of universities or colleges, 32 principals of schools, 136 professors and teachers, 87 presidents of railroad and other corporations, 63 chief engineers ditto, 62 superintendents ditto, 24 treasurers or receivers ditto, 228 civil engineers, 14 judges, 200 attorneys, 20 clergymen, 122 merchants, 230 farmers and planters, 18 bankers, 8 bank presidents, 30 editors, 179 authors, etc.

Of the 8,619 cadets who had entered the Academy, 4,121 had been graduated, 1,945 were living, 1,630 were in the army, 1,446 on the active list and 315 in civil life. The total number of graduates was 4,121. Of these 307 were promoted to the Corps of Engineers, 32 to the Topographical Engineers, 72 to the Ordnance, 49 to the Light Artillery, 1,168 to the Artillery, 1 to the Light Dragoons, 136 to the Dragoons, 648 to the Cavalry, 35 to the Mounted Rifles, 5 to the Mounted Rangers, 1,645 to the Infantry, 5 to the Rifles, 5 to the Marines, and 13 were not commissioned. Two hundred and twenty-four graduates of the Academy have been killed or mortally wounded in action since 1812.

The Academy was housed in the army barracks at West Point till 1815, when Congress appropriated \$30,000 for buildings. Since that time there have been many additions. In 1910 several new buildings were completed and the old ones remodeled. In that year Major-General Thomas H. Barry succeeded Colonel Scott as superintendent.

Military Courts and Courts-Martial. Military jurisdiction is of four kinds: (a) *Military Law*, which is the legal system that regulates the government of the military establishment. It is a branch of the municipal law, and in the United States derives its existence from special constitutional grants of power; (b) *The Law of Hostile Occupation* (Military Government), being military power exercised by a belligerent by virtue of his occupation of an enemy's territory, over such territory and its inhabitants. When a conquered territory is ceded to the conqueror, military government continues until civil government is established by the new sovereign; (c) *Martial Law at Home* (or, as a domestic fact); by which is meant, military power exercised in time of war, insurrection, or rebellion, in parts of the country retaining their allegiance, and over persons and things not ordinarily subjected to it; (d) *Martial Law applied to the Army*; that is, military power extending in time of war, insurrection, or rebellion over persons in the military service, as to obligations arising out of such emergency and not falling within the domain of military law, nor otherwise regulated by law. The last two divisions are applications of the doctrine of necessity to a condition of war. They spring from the right of national self-preservation. The source of military jurisdiction is the Constitution; the specific provisions relating to it being found in the powers granted to Congress, in the authority vested in the President, and in a provision of the Fifth Amendment.

Military Law is derived from both written and unwritten sources. The written sources are the Articles of War, adopted as a part of the Revised Statutes of the United States in 1874 and since amended in some particulars; other statutory enactments relating to the military service; the Army Regulations; and general and special orders, and decisions promulgated by the War Department and by department, post, and other commanders. The unwritten source is the "custom of war," consisting of the customs of the service both in peace and in war.

Military Tribunals are of three kinds: (a) *Courts-Martial* (including summary courts), for the trial of offenders against military law; (b) *Courts of Inquiry*, for examining transactions of, or accusations or imputations against, officers or soldiers; (c) *Military Commissions*, for the trial of offenders against the laws of war and under martial law founded in necessity.

Courts-Martial are composed of commissioned officers only. All officers of the Regular Army, except those on the retired list and professors of the United States Military Academy, are eligible for detail for the trial of offenders belonging to the Regular Army; but no officer will be detailed for the trial of an officer superior to himself in rank when it can be avoided. Officers of the Regular Army and of the Marine Corps, detached for service with the army by order of the President, may be associated together for the trial of offenders belonging to either of these bodies. In like manner regular officers may be associated with volunteer officers for the trial of regulars or volunteers. But with these exceptions, officers of the Regular Army are not competent to sit on courts for the trial of offenders belonging to other forces. Officers of volunteers and of the militia, when the latter

MILITARY EDUCATION

are called into the service of the United States, are competent to act as members of courts for the trial of regular officers or soldiers. Militia officers are also competent to sit upon courts for the trial of volunteers. But courts-martial for the trial of militia must be composed of militia officers only.

In the United States military service, the following courts-martial are authorized: (1) The "General Court-Martial"; (2) the "Summary Court"; (3) the "Garrison Court-Martial"; (4) the "Regimental Court-Martial." The General Court-Martial is the most important, the others being ordinarily called "Inferior Courts-Martial," in the order named. A General Court-Martial may consist of any number of members from 5 to 13, inclusive, and a judge-advocate, but of not less than 13 members when this number can be convened without manifest injury to the service. When, in the course of a trial, the court is reduced in number by reason of absence, challenge, or the relieving of members, it may proceed with business so long as five members remain. Whenever a General Court-Martial is reduced below the minimum, five, the remaining members should direct the judge-advocate to report the fact to the convening authority, and await further orders. In such a case, if the trial has not been entered upon, new members may be added; but if any testimony has been taken, the court should preferably be dissolved and a new one ordered.

The President is empowered to institute General Courts-Martial—1st, as Commander-in-Chief of the Army, under the Constitution, 2d, in the special contingency mentioned below; 3d, in the particular cases provided for by section 1230, Revised Statutes. Any general officer commanding an army, a territorial division, or a department, or colonel commanding a separate division, may appoint a General Court-Martial whenever necessary. But when any such commander is the accuser or prosecutor of any officer under his command the court must be appointed by the President. In time of war this power is extended to the commander of a tactical division or of a separate brigade, but in this case when such commander is the accuser of any person under his command the court must be appointed by the next higher commander. The superintendent of the United States Military Academy has power to convene General Courts-Martial for the trial of cadets, subject to the same limitations and conditions now existing as to other courts-martial. The officer who appoints a court-martial—general, garrison, or regimental—may dissolve it, and control its existence, but not the subject-matter of its deliberations. In the absence of special orders or legislation to that effect, personal presence within the territorial limits of his department is not essential to the validity of commands given by a department commander to be executed within such limits, such, for instance, as the appointment of a court-martial.

Courts-martial derive their existence solely from acts of Congress, and their jurisdiction is limited to the purpose of the maintenance of military discipline. Their decisions, within their jurisdiction, are not reviewable by any courts whatever. They have exclusive jurisdiction to try for acts constituting military offenses only, and also jurisdiction to try for acts which be-

sides constituting military offenses, are civil crimes. In the latter case the military ordinarily gives precedence to the civil court, but when an officer or a soldier has been arraigned before a duly constituted court-martial for an offense triable by it, the jurisdiction thus attached can not be set aside by the process of a State court.

As regards persons, courts-martial have jurisdiction, at all times and in all places, over officers and soldiers of any troops, whether militia or others, mustered and in pay of the United States, over officers and soldiers of the marines, when detached for service with the army, over persons who fraudulently enlist in the service of the United States and receive pay or allowance thereunder, and over offenders, in general, to whom, owing to the commission of a crime, military jurisdiction has legally attached—as by an arrest or confinement—before their discharge from service. This jurisdiction over persons in the military service covers all military offenses committed by them, whether within or beyond the territorial jurisdiction of the United States. Military offenses are not territorial.

As a rule, military jurisdiction ends when a soldier is discharged. The present exceptions to this rule are, discharged officers and soldiers guilty of frauds against the United States under the 60th Article of War, and discharged officers granted trial after summary dismissal, under section 1230, Revised Statutes, and general prisoners. In time of war this jurisdiction extends to "all retainers to the camp and all persons serving with the armies of the United States in the field, though not enlisted soldiers;" to any person who "relieves the enemy with money, victuals, or ammunition, or knowingly harbors or protects an enemy," or who "holds correspondence with, or gives intelligence to, the enemy, either directly or indirectly;" and to spies. As regards offenses, the jurisdiction embraces the offenses specifically defined in the Articles of War, or included under the general terms of the 61st and 62d Articles; the offense of military persons trading with the enemy, and that of fraudulently enlisting in the service of the United States. A court having once duly assumed jurisdiction of an offense and person, cannot, by any wrongful act of the accused, be ousted of its authority or discharged from its duty to proceed fully to try and determine, according to law and its oath. Thus the fact that, pending the trial, the accused has escaped from military custody, furnishes no ground for not proceeding to a finding, and, in the event of conviction, to a sentence, in the case, and the court may and should find and sentence as in any other case. See *Articles, Courts; HABEAS CORPUS; LAW—General Courts-Martial; LAW—Garrison Courts-Martial; LAW—Military Arrests and Confinements; LAW—Military Commissions.*

EDWARD S. FARROW,
Formerly Assistant Instructor of Tactics, United States Military Academy, West Point.

Military Education. A system of education to merit approval must develop physical perfection, patriotism, good morals, and love of law and order, and the system best calculated to contribute to good citizenship is that which produces harmoniously and simultaneously healthy mental, physical, and moral growth. The influence of a military education is thus apparent, and it is readily seen that the value of a military

MILITARY EDUCATION

education depends not so much upon the curriculum as upon the environment and routine in which the student is placed when he is most susceptible of discipline at the most impressionable period of his life.

From the moment the student enters a well-organized military school he is properly fed, clothed, and sheltered, and his welfare is transferred from his shoulders to those of instructors skilled in the art of caring and providing for him, and to his daily instruction is given such care as would be bestowed upon a delicate piece of mechanism. He is taught that cleanliness means sanitation and good health, and, by the constant association with others, regards it not as a luxury, but as an indispensable adjunct to comfort. By daily instruction, precept, and example, he is made to understand that neatness in personal appearance is the most notable element of respectability. He is quick to realize that order, induced by pride and love of judicious restraint, is superior to order inspired by fear of law. He quickly realizes the value of discipline and subjects himself to such restraint as is necessary for its proper observance. He learns to obey, and thus becomes qualified to command, acquiring and appreciating the fundamental principle underlying all law.

In the pursuit of the military feature of education, the student becomes accomplished in the school of make-shift, learns to take care of himself under all circumstances, and becomes proficient in the habit of self-restraint and familiar with natural limitations.

United States—Washington was a firm believer in military education and advocated the necessity of establishing a military academy, and it was due to his efforts, and those of other patriots of the Revolution, that the Academy was created by Act of Congress approved 16 March 1802. The Act authorized the President to organize and establish a Corps of Engineers to consist of 5 officers and 10 cadets, and provided that it should be stationed at West Point, in the State of New York, and should constitute a Military Academy. The Academy, with 10 Cadets present, was formally opened 4 July 1802.

By various amendatory Acts of Congress, up to and including those approved 6 June 1900, 26 June 1902, and 3 March 1903, the Corps of Cadets as now constituted consists of one from each Congressional district, one from each Territory one from the District of Columbia, one from Porto Rico, two from each State at large, and forty from the United States at large, all to be appointed by the President, and, with the exception of the 40 appointed from the United States at large, to be actual residents of the Congressional or Territorial districts, or of the District of Columbia, or of the States, respectively, from which they are appointed. Under these Acts, and under the apportionment of Members of Congress according to the 12th Census, the maximum number of Cadets is 522.

While the United States Military Academy is the foundation system of all military education in the United States, the War Department has established various Schools at Military Posts and elsewhere for instruction in theory and practice. The Artillery School at Fort Monroe; The School for Engineers at Washington Barracks; the special School for Cavalry and Infantry at Fort Riley, Kan.; the Institution for Instruction

in Submarine Defense at Fort Totten, N. Y.; the Army Medical and Dental Schools at Washington; the General Service and Staff College at Leavenworth, Kan., are all active in their respective fields and are the recipients of a general supervision maintained by the Board of the War College at Washington, an institution organized to prepare officers for service on the General Staff. All officers' schools at Military Posts and the General Service and Staff College at Leavenworth are open to National Guard and Volunteer Officers, in recognition of the value of the citizen-soldier in time of war.

At the present time officers of the army are detailed as Professors of Military Science and Tactics at the following educational institutions: University of Arizona, Tucson, Ariz.; Onachita College, Arkadelphia, Ark.; University of Arkansas, Fayetteville, Ark.; University of California, Berkeley, Cal.; Saint Matthew's Military School, San Mateo, Cal.; Mount Tamalpais Military Academy, San Rafael, Cal.; State Agricultural College of Colorado, Ft. Collins, Col.; Delaware College, Newark, Del.; University of Florida, Lake City, Fla.; Georgia Military College, Milledgeville, Ga.; North Georgia Agricultural College, Dahlonega, Ga.; Gordon Institute, Barnesville, Ga.; University of Georgia, Athens, Ga.; University of Idaho, Moscow, Idaho; University of Illinois, Champaign, Ill.; Western Military Academy, Upper Alton, Ill.; Concordia College, Fort Wayne, Ind.; Purdue University, Lafayette, Ind.; Culver Military Academy, Culver, Ind.; Simpson College, Indianola, Iowa; State University, Iowa City, Iowa; Kansas State Agricultural College, Manhattan, Kansas; Agricultural and Mechanical College of Lexington, Ky.; State University and Agricultural College, Baton Rouge, La.; College of the Immaculate Conception, New Orleans, La.; University of Maine, Orono, Maine; Saint John's College, Annapolis, Md. (1905); Maryland Agricultural College, College Park, Md.; Massachusetts Agricultural College, Amherst, Mass.; Massachusetts Institute of Technology, Boston, Mass.; Michigan Agricultural College, Lansing, Mich.; Michigan Military Academy, Orchard Lake, Mich.; College of Saint Thomas, St. Paul, Minn.; Shattuck School, Fribault, Minn. (1904-1906); University of Minnesota, Minneapolis, Minn.; Agricultural and Mechanical College, Agricultural College, Miss.; Drury College, Springfield, Mo.; Wentworth Military Academy, Lexington, Mo.; Kemper Military School, Boonville, Mo.; University of Missouri, Columbia, Mo.; University of Nebraska, Lincoln, Neb.; College of Agriculture and the Mechanic Arts, Durham, N. H.; Rutgers College, New Brunswick, N. J.; College of Agriculture and Mechanic Arts, Mesilla Park, N. M.; New Mexico Military Institute, Roswell, N. M.; Nevada State University, Reno, Nev.; College of Saint Francis Xavier, New York City, N. Y.; Saint John's Military Academy, Manlius, N. Y. (1904, 1905, 1906); New York Military Academy, Cornwall-on-Hudson, N. Y.; Cornell University, Ithaca, N. Y.; De La Salle Institute, New York City, N. Y.; Riverview Academy, Poughkeepsie, N. Y.; North Carolina College of Agriculture and Mechanic Arts, West Raleigh, N. C.; North Dakota Agricultural College, Fargo, N. D.; Miami Military Institute, Germantown, Ohio; Ohio State University, Columbus, Ohio; Ohio

MILITARY EDUCATION

Northern University, Ada, Ohio; Wilberforce University, Wilberforce, Ohio; Ohio Wesleyan University, Delaware, Ohio; University Preparatory School, Tonkawa, Okla.; Grove City College, Grove City, Penn.; Girard College, Philadelphia, Penn.; Pennsylvania Military College, Chester, Penn. (1904, 1905, 1906); Pennsylvania State College, State College, Penn.; Saint Joseph's College, Philadelphia, Penn.; Clemson Agricultural College, Clemson, S. C.; South Carolina Military Academy, Charleston, S. C. (1904, 1905); South Dakota Agricultural College, Brookings, S. D.; University of South Dakota, Vermillion, S. D.; Southwestern Baptist University, Jackson, Tenn.; University of Tennessee, Knoxville, Tenn.; University of the South, Sewanee, Tenn.; West Texas Military Academy, San Antonio, Tex.; Agricultural and Mechanical College of Texas, College Station, Tex.; Agricultural College of Utah, Logan, Utah; Norwich University, Northfield, Vt. (1904, 1905, 1906); University of Vermont, Burlington, Vt.; Virginia Military Institute, Lexington, Va.; (1904, 1905, 1906); Fork Union Academy, Fork Union, Va.; State College Pullman, Wash.; West Virginia University, Morgantown, W. Va.; State University of Wisconsin, Madison, Wis.; Saint John's Military Academy, Delafield, Wis.; University of Wyoming, Laramie, Wyo. Seven of the foregoing institutions whose students have exhibited the greatest application and proficiency in military training and knowledge have been designated annually as "Distinguished Institutions," the year or years in which thus designated being placed after the names of the institutions.

Military academies and instruction schools are now an indispensable part of the military systems of all great nations. Japan and China are active in their creation of new channels for the acquirement of military knowledge and are establishing schools, with courses of instruction and physical training embodying the best features of the United States Military Academy and the following European institutions.

Belgium.—The school that corresponds most nearly to the United States Military Academy is the *École Militaire*, or Military Academy, at Ixelles. The object of this school is to supply officers to the following arms: (1) the infantry, (2) the cavalry, (3) the artillery, and (4) the engineers. The length of the course of instruction is two years for the infantry and cavalry section, and four years for the artillery and engineer section. All students on commencing the second year's course, must contract to serve for eight years. There are no admissions to the school except by competition.

Italy.—The military schools of Italy are divided into three classes, viz.: (1) The *Collegio Militari* established in Rome and Naples; (2) The military schools for the training of officers and non-commissioned officers, of which there are three, viz.: (a) The military school of Modena, (b) the military academy of Turin, and (c) the military sanitary school of application in Florence; (3) The "scuole militari complementari," or the military schools of application proper, for officers, of which there are three, viz.: (a) The war school (*Scuola di Guerra*) in Turin; (b) the school of application of artillery and engineers, in Turin; and (c) the school of cavalry, in Pinerola. There are, in addition to the schools mentioned above, schools for artillery and

musketry practice, a school of fencing, and batteries and platoons of instruction for training non-commissioned officers in their duties.

Austria.—The principal military schools in Austria are the Theresa Military Academy of Wiener-Neustadt, and the Technical Military Academy of Vienna. There are several schools, which prepare for these academies, called military "Realschulen" or technical schools. Though these schools are specially intended to prepare for the military academies, there is nothing to prevent boys from getting their preparation in other "Realschulen" or in private educational establishments. The "Realschulen" generally in Austria and Germany are intended to lay the basis for a scientific education, or what in France is called "l'enseignement moderne." The classical schools are called "Gymnasia."

The course at the military real schools is seven years, of which four are passed in the "Unter-Realschule," and three years in the "Ober-Realschule." There are four of these under technical schools, situated, respectively, at Saint Polten, Guns, Eisenstadt, and Kaschau. They have in all a capacity of about 860 scholars. The superior technical school is at Weisskirchen. It has a capacity of 450 scholars.

The military technical schools also prepare for what is called the "Cadetten-schulen" or cadet schools. The graduates of the cadet schools do not enter the army as officers, but are assigned to corps and regiments as cadets, with the actual or honorary position of non-commissioned officers. As vacancies occur they are appointed "Cadet-Officers-Stellvertreter" (cadet officers' substitutes), in which position they exercise the functions of officers and associate with them without actually having officers' rank. After a probationary period in this position they may be nominated by the Emperor to be lieutenants of the lowest grade in their respective corps, but they must be acceptable to the officers of the unit where they have been on probation.

Armed with what is called the *matura certificate*, the graduate of the "Ober-Realschule" is entitled to apply for appointment to one of the military academies. In these appointments preference is given to officers' sons first, and then to the sons of officials. The standing of at least "good" is required for admission to the academies. Of the graduates with this standing about 60 per cent are promoted to the Theresa Military Academy and about 40 per cent to the Technical Military Academy.

England.—The schools that correspond most nearly to the United States Military Academy are the Royal Military Academy, at Woolwich, and the Royal Military College, at Sandhurst.

The Royal Military Academy is maintained for the purpose of affording a special military education for candidates for commissions in the royal artillery and royal engineers. Candidates must, in the opinion of the commander-in-chief, be in all respects suitable to hold commissions in the army. The commander-in-chief is the president of the Royal Military Academy.

An independent inspection is made annually by a board of visitors, appointed by the Secretary of State for War, and reporting to him. Such visitors are not a permanent body, but are not all changed at the same time. The report of this board is presented to Parliament.

The academy is under the control of a military

MILITARY ENGINEERING—MILITARY INSIGNIA

officer, styled governor and commandant, appointed by and responsible to the Secretary of State for War, through the commander-in-chief. The governor is assisted by a staff officer styled the assistant commandant and secretary, who is responsible in his temporary absence for the charge of the establishment. This officer commands the cadet company, and has the custody of the records and correspondence of the academy, and gives the governor such assistance as he may require.

The Royal Military College is maintained for the purpose of affording a special military education to candidates for commissions in the infantry and cavalry. Candidates must, in the opinion of the commander-in-chief, be in all respects suitable to hold commissions in the army. The commander-in-chief is the president of the Royal Military College.

France—The principal military schools in France are the École Polytechnique, at Paris, and the École Spéciale Militaire, at Saint Cyr, or Saint Cyr, as it is popularly designated.

The Polytechnic School was founded in 1794, and has been reorganized by various decrees. The object of the school is to train students for the following branches of the public service, viz.: The artillery of the army and the marine artillery; the engineer corps of the army (*génie militaire*); the engineer corps of the navy or naval constructors (*génie maritime*); the corps of naval officers; the hydrographic corps; the marine commissariat corps; the corps of highways and bridges (*ponts et chaussées*); the manufactories of the state; the engineers of the powder and saltpeter service; the mining engineers, and the telegraphic lines; also for such other public services as require a profound knowledge of the mathematical, physical, and chemical sciences.

Admittance to the school is exclusively by competitive examination. After a two years' course the student may go to one of the special schools of application for any of the above mentioned services, provided he can pass successfully the final examinations and be declared acceptable for this service by the decision of a committee which draws up the classification list for the public services. Fulfillment of these conditions does not give an absolute right to enter any of the public services; admission to any service depends upon the number of vacancies existing at the time of leaving the school, upon the physical aptitude of the student, and his place on the order of merit.

The special military school of Saint Cyr dates from the time of Louis XIV. It is intended to supply officers for the infantry, the cavalry, and the marine infantry. The course of instruction lasts two years, and no scholar is allowed to remain more than three years at the school. The privilege of taking a third year to complete the course is only allowed where circumstances of exceptional gravity have compelled a student to suspend work at the school.

Germany (Prussia).—The most important military school in Germany is the "Haupt-Kadetten-Anstalt," or Upper Cadet School, at Gross-Lichterfelde. This school is supplied by the "Kadetten-hausen," or preparatory cadet schools of Goslin (formerly at Culmer), Potsdam, Wahlstadt, Bensberg, Plon, Cranienstein, Karlsruhe and Naumburg. Beginning with the lowest class of the preparatory schools, the

classes are designated as Sexta, or VI; Quinta, or V; Quarta, or IV; Unter-tertia, or U. III; Ober-tertia, or O. III; Unter-secunda, or U. II; Ober-secunda, or O. II; Unter-prima, or U. I; Ober-prima, or O. I. In addition there is an extra class called "Selecta."

The course of each of these classes lasts one year. The lower or preparatory schools contain the classes from VI up to and including upper tertia; the other classes belong to the upper cadet school. Occasionally, also, depending on the space available and the necessities of the case, some of the upper-tertia class are admitted to the upper cadet school. In the upper cadet school begins the immediate preparation for service. The classes from sexta up to and including upper prima are assimilated in the matter of instruction to the corresponding classes of the "Realschulen" of the first degree.

Saxony and Bavaria have their own cadet corps corresponding to the preparatory and upper cadet schools of Prussia, from which appointments are made to the Saxon, or Twelfth army corps and to the corps of the Bavarian army. Saxony, however, has no artillery and engineer school, and officers of those arms have to pass through the Prussian School at Berlin. Bavaria has its own artillery and engineer school at Munich.

A review of the successful men of all countries will reveal the abnormal proportion who have enjoyed military training and military experience. In the United States it is impossible to mention any important field of activity into which West Point graduates have not entered and achieved success and greatness. The characteristics of self-reliance and self-restraint, derived from military education, are the potent attributes of good citizenship and the basic principles of success, combining with mental development the military methods of physical and moral improvement. See UNITED STATES MILITARY ACADEMY and WAR COLLEGE.

Military Insignia of Rank. Insignia of rank is worn to-day in all armies to distinguish the various grades of officers and non-commissioned officers. It is usually in the form of epaulets, straps, braid, buttons, or chevrons, and is worn on the shoulder, sleeve, or collar of the uniform coat, according to the custom of the country to which the soldier belongs.

Military uniform did not come into existence until after the Thirty Years' War, the household troops of Louis XIV. of France being the first to wear it. Badges of rank were not in general use in the different armies until the latter part of the 18th century, although some regiments had adopted distinctive devices for this purpose long before that time.

In all armies the insignia of rank is such as is prescribed by the government, and all officers and soldiers are forbidden to wear any insignia except such as that to which their rank entitles

MILITARY INSIGNIA OF RANK.

them. The form of the insignia is always the same for officers or non-commissioned officers of the same rank, but its color sometimes differs according to the arm of the service to which the wearer belongs.

The various badges of rank worn today in the principal armies of the world are as follows:

UNITED STATES.

In the United States army there are three recognized uniforms known as full dress, dress, and service. Officers attending social functions of a military nature are permitted to wear a special full-dress uniform of a cut similar to civilian evening dress.

The full-dress coat for officers is dark blue and double-breasted, the dress coat is dark blue and single-breasted having concealed buttons, the service coat is single-breasted and of an olive drab color. The coats of all enlisted men are single-breasted, dark blue for full dress and dress and olive drab for service. Officers wear their insignia of rank on the sleeves of their full-dress and special full-dress coats, and on the shoulders of their dress and service coats. With the dress coat the distinctive insignia forms a part of the shoulder strap, the field of which differs in color according to the arm of the service to which the wearer belongs; on the service coat the device is attached directly to the shoulder loop which is of the same material as the coat.

SLEEVE INSIGNIA.

Major-General.—Two silver stars placed above a band of gold embroidered oak leaves which encircle the cuff.

Brigadier-General.—One silver star placed as above.

Colonel.—Five strands of gold wire lace arranged in the form of a knot extending from the cuff to just below the elbow.

Lieutenant-Colonel.—Four strands.

Major.—Three strands.

Captain.—Two strands.

First Lieutenant.—One strand.

Second Lieutenant.—Without gold lace.

SHOULDER INSIGNIA.

Major-General.—Two silver stars.

Brigadier-General.—One silver star.

Colonel.—One silver eagle.

Lieutenant-Colonel.—One silver leaf.

Major.—One gold leaf.

Captain.—Two silver bars.

First Lieutenant.—One silver bar.

Second Lieutenant.—A shoulder strap with a blank field with dress uniform, no insignia with service uniform.

Officers of the United States army wear the letters "U. S." on the collars of their dress and service coats; officers of the United States Volunteers the letters "U. S. V."; officers of the National Guard the initial letters of their respective states.

Each branch of the service and each staff department has a distinctive color with which the uniforms of the members of that portion of the army are faced.

The following are the colors of the different facings:

Staff Corps.—Dark blue.

Engineers.—Scarlet piped with white.

Signal Corps.—Orange piped with white.

Ordnance Department.—Black piped with scarlet.

Medical Corps.—Maroon.

Quartermaster's Department.—Buff.

Cavalry.—Yellow.

Artillery.—Scarlet.

Infantry.—Light blue.

The rank of non-commissioned officers is indicated by means of chevrons, of the color of the arm of the service to which the soldier belongs, worn point upward midway between the elbow and the shoulder on the sleeves of all uniform coats.

Sergeants wear three stripes, corporals two, and lance corporals one. In addition to his stripes, a regimental sergeant-major has an arc of three bars, a battalion sergeant-major an arc of two bars, a regimental quartermaster-sergeant a tie of three bars, a battalion quartermaster-sergeant a tie of two bars, a regimental commissary-sergeant a tie of three bars and a crescent, a first sergeant a lozenge, and a company quartermaster-sergeant a tie of one bar. Non-commissioned officers of the different departments wear the distinctive devices of their departments with their chevrons.

Rank of non-commissioned officers is further indicated by the width of the trouser stripes, sergeants wearing a $1\frac{1}{4}$ -inch stripe, corporals a one-half inch stripe.

To indicate service in war all enlisted men who have seen such service are entitled to wear on the sleeves of their dress coat a diagonal half chevron of white cloth, piped on each side with the facing of the arm of the service in which they earned the right to wear the chevron.

CONFEDERATE STATES.

During the Civil War the rank of officers and non-commissioned officers of the Confederate Army was indicated in the following manner, the insignia being displayed upon the uniform coat, which for officers and enlisted men was double breasted and of a cadet grey color.

Rank of officers was designated by an ornament of gold braid worn on both sleeves of the coat extending around the seam of the cuff and up the outside of the arm to the bend of the elbow. The ornament was composed of four braids for general officers, three for field officers, two for captains and one for lieutenants. Besides this sleeve decoration, the rank of officers was further shown by devices worn on the collar of the tunic as follows:

General Officers.—A wreath with three stars enclosed, embroidered in gold.

Colonel.—Three gold stars arranged horizontally.

Lieutenant Colonel.—Two gold stars.

Major.—One gold star.

Captain.—Three gold bars arranged horizontally.

First Lieutenant.—Two gold bars.

Second Lieutenant.—One gold bar.

Rank of non-commissioned officers was indicated by chevrons worn on both sleeves of the coat above the elbow, point downwards, of the color of the facing of the arm of the service to which the wearer belonged.

Sergeant-Major.—Three bars and an arc in silk

MILITARY INSIGNIA OF RANK.

Quartermaster-Sergeant.—Three bars and a tie in silk.

Ordnance-Sergeant.—Three bars and a star in silk.

First Sergeant.—Three bars and a lozenge in worsted.

Sergeant.—Three bars in worsted.

Corporal.—Two bars in worsted.

The coats of both the officers and of the enlisted men were piped with a facing of the color of the arm of the service to which they belonged, the facings being as follows:

General Officers, Adjutant-General's Department, Quartermaster-General's Department, Commissary-General's Department and Engineers.—Buff.

Medical Department.—Black.

Artillery.—Red.

Cavalry.—Yellow.

Infantry.—Light blue.

GREAT BRITAIN.

Insignia of rank in the British Army is worn on the shoulders by officers, and on the right sleeve of the coat by enlisted men.

The rank badges of the officers, which may be either metal or embroidery, and which are attached to the shoulder pieces of the coat, are as follows:

Field Marshal.—Crossed batons on a wreath of laurel, with a crown above.

General.—Crossed sword and baton, with star and crown above.

Lieutenant-General.—Crossed sword and baton, with crown above.

Major-General.—Crossed sword and baton, with star above.

Brigadier-General.—Crossed sword and baton.

Colonel.—Crown and two stars below.

Lieutenant-Colonel.—Crown and one star below.

Major.—Crown.

Captain.—Three stars.

Lieutenant.—Two stars.

Second Lieutenant.—One star.

Prior to May 1902, a captain wore two stars, a lieutenant one star, and a second lieutenant had no badge of rank.

Regimental officers having brevet rank wear the badges of their army rank, department officers having honorary rank the badges of that rank. Retired officers wear the letter R on their shoulder pieces directly below their badges of rank, officers of the militia the letter M.

The rank of non-commissioned officers is indicated by means of a chevron, worn point downwards, on the sleeve of the coat above the elbow. A sergeant wears three stripes of gold braid, a lance sergeant three stripes of worsted, a corporal two stripes of worsted, and a lance corporal one stripe of worsted.

GERMANY.

Insignia of rank in the German army is worn on the shoulders by officers and on the collar by non-commissioned officers.

Prior to 1808 there were no recognized badges of rank in the Prussian army, although Bavaria had already adopted them to some extent. During that year a system of rank badges was devised for the officers of the Prussian army which were worn on the shoulder pieces of the coat. During the campaign of

1813-1814 these shoulder pieces were converted into epaulets and the insignia of rank was transferred to them, and the epaulet has ever since remained the distinctive mark of the officer. The German army of today is composed of twenty-two army corps named after the different kingdoms which compose the empire. Each kingdom has some distinctive mark which is worn only by its troops; the insignia of rank however is the same throughout the army without regard to corps, or arm of service.

Except in the case of a General Field Marshal, the rank of officers is indicated by means of stars worn on the shoulder knots or epaulets.

Officers below the grade of major wear shoulder knots, all other officers epaulets. Shoulder knots are formed of half moon shaped pieces of gold or silver embroidery (according to the regiment) enclosing a cloth field of the color of the army corps to which the regiment belongs. On the field is displayed the regimental number and the insignia of rank. Epaulets for officers below the grade of major general are of the same design as that of the shoulder knot with the addition of gold or silver fringe, according to the embroidery of the knot.

The epaulets of general officers are of silver button.

Insignia of rank for officers is as follows:

General Field Marshal.—Two gold crossed batons.

Colonel-General.—Three gold stars.

General of Infantry or Cavalry.—Two gold stars.

Lieutenant-General.—One gold star.

Major-General.—Blank epaulet.

Colonel.—Two gold stars.

Lieutenant-Colonel.—One gold star.

Major.—Blank field.

Captain.—Two gold stars.

First Lieutenant.—One gold star.

Second Lieutenant.—Blank field.

Non-commissioned officers wear the insignia of their rank on the standing collar of their coat, the different grades being distinguished in the following manner:

Lance Corporal.—Two small buttons of gold or silver (according to regiment) worn, one on each side of the collar directly above the shoulder.

Corporal.—A stripe of gold or silver lace extending around the top of the collar.

Sergeant.—The same collar stripe as that of a corporal with the addition of two large buttons worn on either side of the collar in the same manner as the buttons of a lance corporal.

FRANCE.

In the French Army, insignia of rank is worn on the sleeves of the uniform coat by both officers and enlisted men. For officers it consists of stripes of gold or silver braid, according to the arm of the service, worn either straight across the sleeve directly above the cuff, or arranged in the form of a loop extending from the cuff to a point midway between the elbow and the shoulder. For enlisted men it consists of stripes of red or yellow cloth, or gold or silver braid, worn diagonally across the sleeve of the coat above the cuff.

Officers of infantry, engineers, spahis, and of the Garde Republicaine wear straight gold stripes; officers of cuirassiers, dragoons, chasseurs a cheval, hussars, chasseurs d'Afrique

MILITARY INSIGNIA OF RANK.

zephirs, and of the gendarmie, straight silver stripes; officers of zouaves, turcos, and artillery, looped gold stripes.

Corporals of infantry, zouaves, cuirassiers, dragoons, chasseurs a cheval, hussars, artillery, and engineers wear red stripes; corporals of turcos, chasseurs a pied, zephirs, chasseurs d'Afrique, and spahis, yellow stripes.

The distinctive insignia of the various grades is as follows:

General of Division.—Six stripes of black mohair braid arranged in the form of a pointed loop, and three silver stars.

General of Brigade.—Six stripes of black mohair braid arranged as for a general of division, and two silver stars.

Colonel.—Five stripes of gold or silver braid.

Lieutenant-Colonel.—Three stripes of gold and two of silver, or three of silver and two of gold.

Major.—Four gold or silver stripes.

Captain.—Three gold or silver stripes.

Lieutenant.—Two gold or silver stripes.

Sous Lieutenant.—One gold or silver stripe.

Sergeant-Major.—Two gold or silver stripes.

Sergeant.—One gold or silver stripe.

Corporal.—Two red or yellow stripes.

Adjutants rank between officers and non-commissioned officers, a grade corresponding to that of a warrant officer of the United States Navy. They wear practically the same uniform as that of a sous lieutenant, but their stripe is of the opposite color from that of the officers of their regiment.

Insignia of rank is also worn on the cap by officers, the cap being braided to conform with the sleeve decoration. When in full dress, officers wear epaulettes of gold or silver according to the arm of the service to which they belong.

AUSTRIA-HUNGARY.

In the Austrian Army, the insignia of rank is worn on the standing collar of the coat by both officers and enlisted men. Officers below the grade of major, and all non-commissioned officers wear the badges of their rank upon a field of cloth, of the color of their regimental facing, extending from the front of the collar to the line of the shoulder piece; all other officers wear their badges of rank upon a field of gold.

The following is the distinctive insignia of the different grades:

Commander-in-Chief.—Gold collar embroidered with oak leaves.

Marshal.—Three gold stars.

Field Marshal.—Two gold stars.

Major-General.—One gold star.

Colonel.—Three silver stars.

Lieutenant-Colonel.—Two silver stars.

Major.—One silver star.

Captain.—Three gold stars.

First Lieutenant.—Two gold stars.

Second Lieutenant.—One gold star.

Sergeant.—Three metal stars, and a yellow stripe extending around the front and lower side of the collar field.

Lance Sergeant.—Three metal stars.

Corporal.—Two metal stars.

Lance Corporal.—One metal star.

ITALY.

In the Italian Army the insignia of rank, except in the case of general officers, is worn on

the sleeve of the coat. The design, which is that of a loop, extends from the cuff to the elbow.

General officers wear one, two, or three stars according to rank. Sleeve insignia is as follows:

Colonel.—One wide, and three narrow stripes of gold braid.

Lieutenant-Colonel.—One wide, and two narrow stripes of gold braid.

Major.—One wide, and one narrow stripe of gold braid.

Captain.—Three narrow stripes of gold braid.

First Lieutenant.—Two narrow stripes of gold braid.

Second Lieutenant.—One narrow stripe of gold braid.

Sergeant.—One red stripe with one gold stripe underneath.

Corporal.—One red stripe.

SPAIN.

The insignia of rank in the Spanish Army is worn on the cuff of the coat by both officers and enlisted men. It consists of a form of braiding, technically known as galones, of gold, silver, or cloth, which extends across the top and down the back of the cuff. These galones vary in width according to rank and are of gold in some regiments and of silver in others. Stars of either gold or silver, to match the galones, are worn by all officers below the grade of brigadier-general.

The distinctive insignia of the various grades is as follows:

Captain-General.—Three stripes of twisted gold braid.

Lieutenant-General.—Two stripes of twisted gold braid.

Major-General.—One stripe of twisted gold braid.

Brigadier-General.—One stripe of twisted silver braid.

Colonel.—Three stripes of gold or silver braid (according to regiment) of five threads each, and three eight-pointed stars, of gold or silver, worn below the galones.

Lieutenant-Colonel.—Two stripes and two stars like those of a colonel.

Major.—One gold and one silver stripe, and one gold and one silver star worn below the galones.

Captain.—Three stripes of gold or silver braid, and three stars to match, worn above the galones.

Lieutenant.—Two stripes and two stars like those of a captain.

Ensign.—One stripe and one star like those of a captain.

Staff-Sergeants.—One stripe like that of an ensign.

First Sergeant.—Three narrow gold or silver stripes.

Sergeant.—Two stripes like those of a first sergeant.

Corporal.—Three stripes of scarlet cloth.

Lance Corporal.—Two stripes of scarlet cloth.

RUSSIA.

Russian Army officers wear their insignia of rank on their shoulders, the distinctive badges being displayed upon shoulder straps extending from the sleeve to the collar, when in undress and service uniform, and on shoulder knots and epaulettes when in full dress. The following are

MILITARY LAW—MILITARY POSTS, UNITED STATES

the designs of the different shoulder straps and the badges of rank worn with them.

For general officers a strap of zig-zag pattern.

General.—No badge.

Lieutenant-General.—Three stars.

Major-General.—Two stars.

For field officers, and staff officers of the same rank, a strap containing two stripes.

Colonel.—No badge.

Lieutenant-Colonel.—Three stars.

For line officers, and staff officers of the same rank, a strap containing one stripe.

Captain.—No badge.

Second Captain.—Four stars.

First Lieutenant.—Three stars.

Second Lieutenant.—Two stars.

The Hussars of the Guard have a special form of shoulder strap but the insignia displayed thereon is the same as that worn by the rest of the army.

In addition to the stars, the shoulder straps bear likewise the numbers or letters designating the unit to which the officer belongs. The different colors of the straps denote the various arms of the service.

JAPAN.

The Japanese wear the insignia of their military rank on their sleeves, the design, which is in the form of a pointed loop of braid, extending from the cuff to a point midway between the elbow and the shoulder. The number of stripes which compose the loop indicate the different grades of rank.

For all officers except those of the Pay, and the Medical Corps, the stripes are of gold, for the officers of the Pay Corps they are of silver, and for the officers of the Medical Corps of alternate silver and gold. General officers wear their stripes above a band of gold, all other officers wear them above a pointed cuff of the color of the arm of the service to which they belong.

The colors which denote the various arms of the service are, scarlet for infantry, green for cavalry, yellow for artillery, and dark red for engineers.

The sleeve insignia of officers is as follows:

Marshal.—Seven stripes.

General.—Same as marshal.

Lieutenant-General.—Six stripes.

Major-General.—Five stripes.

Colonel.—Six stripes.

Lieutenant-Colonel.—Five stripes.

Major.—Four stripes.

Captain.—Three stripes.

First Lieutenant.—Two stripes.

Second Lieutenant.—One stripe.

The rank of non-commissioned officers is indicated by means of stripes of the color of the arm of the service to which the wearer belongs, worn in the form of a band around the cuff.

First Sergeant.—Three stripes.

Sergeant.—Two stripes.

Corporal.—One stripe.

CHINA.

The rank of officers of the Chinese Army is indicated by embroidered badges representing animals, worn upon the breast of the military tunic, the distinctive badges of the different grades being as follows:

Commander-in-Chief.—Unicorn.

Lieutenant-General.—Lion.

Major-General.—Lion.

Colonel.—Leopard.

Lieutenant-Colonel.—Leopard.

Major.—Tiger.

Captain.—Bear.

Lieutenant.—Panther.

Ensign.—Panther.

Wives of Chinese officers are entitled to wear the badges of their husband's rank.

FRED GILBERT BLAKESLEE.

Military Instructor, West Middle District School, Hartford, Conn.

Military Law. See LAW, MILITARY.

Military Masts, in naval architecture, masts on a modern fighting ship, provided purely for military purposes. They are of steel, and hollow, and through them access is had to the conning tower on the superstructure of the deck where are the wheel, the wires communicating to all parts of the ship, and where the captain generally takes his stand; to the fighting-top with its rapid-fire guns; and to the look-out far above all of these.

Military Music. See BAND; MUSIC.

Military Occupation, Law of. See LAW, MILITARY.

Military Order of Foreign Wars. See FOREIGN WARS, MILITARY ORDER OF.

Military Orders. See ORDERS, ROYAL.

Military Police, in the United States army police duty is required of the provost guard; in the British army it consists of mounted and unmounted branches of the regular army service; in France police duty is performed by the gendarmes (q.v.); in Canada, the Northwest mounted police do patrol duty, and there are similar bodies in Australia. In South Africa, the Cape mounted police are available for military duty, and there are similar forces in most of the African colonies.

Military Posts, United States. Upward of 5,000 forts, camps, redoubts, reservations, etc., have been established or erected in the United States since the early colonial period. A great many of these military posts were the result of the Civil War and but few of them have since been maintained. The list of forts, barracks, arsenals, national cemeteries, etc., occupied by troops in 1902, and under control of the War Department, was as follows:

Adams, Fort, R. I.—On Brenton's Point, near Newport.

Alcatraz Island, Fortifications on, Cal.—San Francisco Harbor.

Alexandria National Cemetery, La.—At Pineville.

Alexandria National Cemetery, Va.—At Alexandria.

Allgheny Arsenal, Pa.—At Pittsburgh.

Andersonville National Cemetery, Ga.—At Andersonville.

Andrew, Fort, Mass.—At Gurnet Point, near Plymouth.

Andrews, Fort, Mass.—On Peddock's Island.

Angel Island, Fort on, Cal.—Now Fort McDowell.

Annapolis National Cemetery, Md.—At Annapolis.

Antietam National Cemetery, Md.—At Sharpsburg.

Apache, Fort, Ariz.—On White Mountain River.

Arlington National Cemetery, Va.—Opposite Washington, D. C.

Armistead, Fort, Md.—At Hawkin's Point, Patapsco River.

Army and Navy General Hospital, Ark.—At Hot Springs.

Assiniboine, Fort, Mont.—On Beaver Creek, Chouteau County.

MILITARY POSTS

- Bagley Battery, N. C.—At Port Caswell.
 Baker, Fort, Cal.—At Lime Point, San Francisco Harbor.
 Ball's Bluff National Cemetery, Va.—On Potomac River.
 Banks, Fort, Mass.—At Grover's Cliff, near Boston.
 Barnes General Hospital, D. C.—At Soldiers' Home.
 Barrancas, Fort, Fla.—Near Pensacola.
 Barrancas National Cemetery, Fla.—North Side of Pensacola Bay.
 Baton Rouge National Cemetery, La.—At Baton Rouge.
 Battle Ground National Cemetery, D. C.—Near Soldiers' Home.
 Bayard, Fort, N. Mex.—At Pinos Altos, Grant County.
 Beaufort National Cemetery, S. C.—At Beaufort.
 Bellevue Rifle Range, Neb.—On Missouri River.
 Benicia Arsenal, Cal.—At Benicia.
 Benicia Barracks, Cal.—At Benicia.
 Berry Battery, Me.—On Great Diamond Island.
 Beverly National Cemetery, N. J.—At Beverly.
 Bliss, Fort, Tex.—At El Paso.
 Boise, Fort or Barracks, Idaho.—At Boise City.
 Bowdoin Battery, Me.—On Cushing's Island.
 Bowyer Battery, Ala.—At Fort Morgan.
 Brady, Fort, Mich.—At Sault Ste. Marie.
 Brown, Fort, Tex.—At Brownsville.
 Brownsville National Cemetery, Tex.—At Brownsville.
 Brunby Battery, Ga.—At Fort Screven.
 Butler, Camp, National Cemetery, Ill.—At Springfield.
 Canby, Fort, Wash.—On Cape Disappointment.
 Capron Battery, S. C.—At Sullivan's Island.
 Carlisle Barracks, Pa.—At Carlisle.
 Carroll, Fort, Md.—At Sailer's Point Plaza, Patuxent River.
 Casey, Fort, Wash.—Near Port Townsend.
 Caswell, Fort, N. C.—On Oak Island, Cape Fear River.
 Caswell Battery, S. C.—At Port Caswell.
 Cave Hill National Cemetery, Ky.—At Louisville.
 Central Branch National Military Home, Ohio.—Montgomery County.
 Chalmers National Cemetery, La.—Near New Orleans.
 Chattanooga National Cemetery, Tenn.—At Chattanooga.
 City Point National Cemetery, Va.—At City Point.
 Clark Battery, Ore.—At Fort Stevens.
 Clark, Fort, Tex.—Near Brackettville.
 Clinch (1), Fort, Fla.—On Amelia Island, at Fernandina.
 Cold Harbor National Cemetery, Va.—In Hanover County.
 Columbia, Fort, Wash.—At Chinook Point.
 Columbus, Fort, N. Y.—On Governor's Island.
 Columbus Barracks, Ohio.—At Columbus.
 Constitution, Fort, N. H.—Near Portsmouth.
 Corinth National Cemetery, Miss.—At Corinth.
 Crook, Fort, Neb.—Searcy County, 10 miles from Omaha.
 Crown Hill National Cemetery, Ind.—At Jeffersonville.
 Collins, Battery, Fla.—At Fort Pickens.
 Culpeper National Cemetery, Va.—At Culpeper.
 Ouster Battlefield National Cemetery, Mont.—At Crow Agency.
 Cypress Hills National Cemetery, N. Y.—At Brooklyn.
 Dade (new), Fort, Fla.—On Egmont Key.
 Danville Branch National Home, Ill.—At Danville.
 Danville National Cemetery, Ky.—At Danville.
 D. A. Russell, Fort, Wyo.—Near Cheyenne.
 David's Island Depot, etc., N. Y.—Now Fort Stoen.
 Davis, Fort, Alaska.—At Nome City.
 Dearborn Battery, Ala.—At Fort Morgan.
 Decatur Battery, Md.—At Fort Washington.
 Delaware, Fort, Del.—On Pea Patch Island.
 De Leon Battery, Fla.—At Key West.
 De Soto, Fort, Fla.—On Mallet Key.
 Donelson, Fort, National Cemetery, Tenn.—At Dover.
 Doucharpe, Camp, Cal.—On Angel Island.
 Doubleday Battery, N. Y.—At Fort Hamilton.
 Douglas, Fort, Utah.—3 miles east of Salt Lake City.
 Douglas, Camp, Wis.—In Juneau County.
 Dover, U. S. Powder Depot at N. J.—At Dover.
 Duane Battery, N. Y.—At Fort Wadsworth.
 Du Chesne, Fort, Utah.—In Uintah County.
 Du Pont, Fort, Del.—At Delaware City.
 Eastern Branch National Home, Me.—At Togus.
 Egbert, Fort, Alaska.—At Eagle City.
 Emory Battery, Md.—At Fort Washington.
 Ethan Allen, Fort, Vt.—3 miles from Burlington.
 Fayetteville National Cemetery, Ark.—At Fayetteville.
 Finns Point National Cemetery, N. J.—Near Salem.
 Flagler Battery, N. C.—Near Fort Marion.
 Flagler, Fort, Wash.—Marrowsstone Point, Puget Sound.
 Florence National Cemetery, S. C.—At Florence.
 Foote, Fort, Md.—At Rosier's Bluff.
 Foster, Fort, Me.—On Gerrish Island.
 Fredericksburg National Cemetery, Va.—At Fredericksburg.
 Fremont, Fort, S. C.—On St. Helena Island.
 Gaines, Fort, Ala.—On Dauphin Island, Mobile Bay.
 Gettysburg National Cemetery, Pa.—At Gettysburg.
 Gibbon, Fort, Alaska.—At the mouth of Tanana River.
 Gilmore Battery, N. Y.—At Fort Hamilton.
 Glendale National Cemetery, Va.—At Glendale.
 Gorges, Fort, Me.—On Hog Island Ledge, Portland Harbor.
 Grafton National Cemetery, W. Va.—At Grafton.
 Granger Battery, N. J.—At Fort Hancock.
 Grant, Fort (new), Ariz.—At foot of Mt. Graham.
 Gratiot, Fort, Mich.—On St. Clair River, near Port Huron.
 Great Diamond Island, Batteries on, Me.—Portland Harbor.
 Greble, Fort, R. I.—On Dutch Island, near Newport.
 Greene Battery, R. I.—At Port Adams.
 Gregg Battery, N. J.—At Fort Mott.
 Griswold, Fort, Conn.—At New London.
 Hale, Fort, Conn.—New Haven Harbor.
 Halse Battery, R. I.—At Fort Greble.
 Hamilton, Fort, N. Y.—New York Harbor.
 Hampton National Cemetery, Va.—At Hampton.
 Hancock, Fort, N. J.—At Sandy Hook.
 Harrison, Fort, Mont.—4 miles from Helena.
 Harrison, Fort, National Cemetery, Va.—At Varnasgrove.
 Heath, Fort, Mass.—Near Winthrop.
 Honeycutt Battery, Me.—At Great Diamond Island.
 Hot Springs Reservation, Ark.—In Garland County.
 Houston, Sam, Fort, Tex.—At San Antonio.
 Howard, Fort, Md.—At North Point, Patuxent River.
 Huchuca, Fort, Ariz.—In Cochise County.
 Humphreys Battery, Md.—At Fort Washington.
 Hunt, Fort, Va.—On the Potomac River.
 Independence, Fort, Mass.—On Castle Island, Boston.
 Indianapolis Arsenal, Ind.—At Indianapolis.
 Jackson Barracks, La.—Near New Orleans.
 Jackson, Fort, La.—Mississippi River.
 Jasper Battery, S. C.—At Sullivan's Island.
 Jefferson Barracks, Mo.—3 miles below St. Louis.
 Jefferson Barracks National Cemetery, Mo.—At Jefferson Barracks.
 Jefferson City National Cemetery, Mo.—At Jefferson City.
 Jeffersonville Quartermaster Depot, Ind.—At Jeffersonville.
 Johnston, Fort, N. C.—Near Southport.
 Kendrick Battery, Me.—On Cushing Island.
 Kennebec Arsenal, Me.—At Augusta.
 Keogh, Fort, Mont.—In Custer County.
 Keokuk National Cemetery, Iowa.—At Keokuk.
 Key West Barracks, Fla.—At Key West.
 King Battery, N. Y.—At Fort Totten.
 Knox, Fort, Me.—At Bucksport.
 Knoxville National Cemetery, Tenn.—At Knoxville.
 Kravenbuhl Battery, N. Y.—At Fort Mott.
 Lafayette, Fort, N. Y.—In New York Harbor.
 Lawton, Fort, Wash.—At Magnolia Bluff.
 Leavenworth, Fort, Kan.—3 miles from Leavenworth.
 Leavenworth Military Prison, Kan.—At Fort Leavenworth.
 Leavenworth, Fort, National Cemetery, Kan.—At Fort Leavenworth.
 Lebanon National Cemetery, Ky.—At Lebanon.
 Levett, Fort, Me.—On Cushing's Island.
 Lewis Battery, Ore.—At Fort Stevens.
 Lexington National Cemetery, Ky.—At Lexington.
 Lincoln, Fort, N. Dak.—near Bismarck.
 Liscomb, Fort, Alaska.—At Fort Valdez.
 Little Rock National Cemetery, Ark.—At Little Rock.
 Livingston, Fort, La.—On Grand Terre Island.
 Logan, Fort, Colo.—10 miles from Denver.
 Logan H. Root, Fort, Ark.—Near Little Rock.
 Loudon Park National Cemetery, Md.—At Baltimore.
 McClary, Fort, Me.—On Kittery Point.
 McDowell, Fort, Cal.—On Angel Island.
 McHenry, Fort, Md.—At Baltimore.
 McIntosh, Fort, Tex.—On Rio Grande, near Laredo.
 Mackenzie, Fort, Wyo.—Near Sheridan.
 Mackinac, Fort, Mich.—On Mackinac Island.
 Macomb, Fort, La.—At Chef Menteur Pass.
 Maconn, Fort, N. C.—On Hogue Island.
 McPherson, Fort and Barracks, Ga.—At Atlanta.
 McPherson, Fort, National Cemetery, Neb.—At Maxwell.
 McRee, Fort, Fla.—Pensacola Bay.
 Madison Barracks, N. Y.—At Sackett Harbor.
 Mansfield, Fort, R. I.—Metastree Point, near Watch Hill.
 Marietta National Cemetery, Ga.—Near Marietta.

MILITARY PRISONS—MILITARY PUNISHMENTS

- Marion, Fort, Fla.—At St. Augustine.
 Marion Branch National Military Home, Ind.—Grand County.
 Mason, Fort, Cal.—Black Point, San Francisco.
 Meade, Fort, S. Dak.—On Bear Butte Creek.
 Meigs Battery, Md.—At Fort Washington.
 Memphis National Cemetery, Tenn.—At Memphis.
 Mexico City National Cemetery, Mexico.—City of Mexico.
 Michie, Fort, N. Y.—Near New London, Conn.
 Mifflin, Fort, Pa.—On Mud Island, Delaware River.
 Miley, Fort, Cal.—Point Lobos, San Francisco Harbor.
 Mill Springs National Cemetery, Ky.—At Mill Springs.
 Missoula, Fort, Mont.—On Bitter Root River.
 Mobile National Cemetery, Ala.—Near Mobile.
 Monroe, Fort, Va.—At Old Point Comfort.
 Montgomery, Fort, N. Y.—At Rouse's Point.
 Morgan, Fort, Ala.—At Mobile Point.
 Mott, Fort, N. Y.—At Finn's Point.
 Moultrie, Fort, S. C.—Charleston Harbor.
 Mound City National Cemetery, Ill.—At Mound City.
 Myer, Fort, Va.—At Arlington.
 Nashville National Cemetery, Tenn.—At Nashville.
 Natchez National Cemetery, Miss.—At Natchez.
 New Albany National Cemetery, Ind.—At New Albany.
 Newbern National Cemetery, N. C.—At Newbern.
 Newton, Fort, N. Y.—On Staten Island.
 New York Arsenal, N. Y.—On Governor's Island.
 Niagara, Fort, N. Y.—At the mouth of the Niagara River.
 Niobrara, Fort, Neb.—In Cherry County.
 Northwestern Branch National Home, Wis.—Milwaukee County.
 Oglethorpe, Fort, Ga.—At Savannah.
 Ontario, Fort, N. Y.—At Oswego.
 Ocala Battery, Fla.—At Key West.
 Pacific Branch Soldiers' Home, Cal.—At Santa Monica.
 Paddock's Island, Fort on, Mass.—Fort Andrews.
 Pensacola Battery, Fla.—Santa Rosa Island.
 Philadelphia National Cemetery, Pa.—At Philadelphia.
 Phoenix, Fort, Mass.—New Bedford Harbor.
 Pickens, Fort, Fla.—Santa Rosa Island.
 Plattsburg Barracks, N. Y.—At Plattsburg.
 Poplar, Fort, Me.—Mouth of Kennebec River.
 Poplar Grove National Cemetery, Va.—Near Petersburg.
 Porter, Fort, N. Y.—At Buffalo.
 Port Hudson National Cemetery, La.—At Port Hudson.
 Portland Head, Fort at, Me.—Fort Williams.
 Preble, Fort, Me.—In Portland Harbor.
 Presidio of San Francisco, Cal.—At San Francisco.
 Palaski, Fort, Ga.—Savannah Harbor.
 Quincy National Cemetery, Ill.—At Quincy.
 Raleigh National Cemetery, N. C.—At Raleigh.
 Rampart Camp, Alaska.—At Rampart City.
 Reno, Fort, Okla.—On Canadian River.
 Revere, Fort, Mass.—At Hull.
 Richmond Battery, N. Y.—At Fort Wadsworth.
 Richmond National Cemetery, Va.—At Richmond.
 Riley, Fort, Kan.—Near Junction City.
 Ringgold, Fort, Tex.—Near Rio Grande City.
 Robinson, Fort, Neb.—At Red Cloud Agency.
 Rock Island National Cemetery, Ill.—At Rock Island.
 Rock Island Army and Arsenal, Ill.—On Rock Island.
 Rodman, Fort, Mass.—Near New Bedford.
 Rosecrans, Fort, Cal.—At San Diego.
 Russell, D. A., Fort, Wyo.—3 miles from Cheyenne.
 St. Augustine National Cemetery, Fla.—At St. Augustine.
 St. Francis Barracks, Fla.—At St. Augustine.
 St. Louis Powder Depot, Mo.—At Jefferson Barracks.
 St. Louis Clothing Depot, Mo.—At St. Louis.
 St. Michael, Fort, Alaska.—On St. Michael's Island.
 St. Philip, Fort, Ala.—Mobile River.
 St. Philip, Fort, La.—Mississippi River.
 Salisbury National Cemetery, N. C.—At Salisbury.
 Sam Houston, Fort, Tex.—At San Antonio.
 San Antonio Arsenal, Tex.—At San Antonio.
 San Antonio National Cemetery, Tex.—San Antonio.
 San Diego Barracks, Cal.—At San Diego.
 San Francisco National Cemetery, Cal.—At the Presidio.
 San Jacinto, Fort, Tex.—Near Galveston.
 Santa Fé National Cemetery, N. M.—At Santa Fé.
 Scammel, Fort, Me.—Portland Harbor.
 Schuyler, Fort, N. Y.—At Throg's Neck.
 Scott, Fort, National Cemetery, Kan.—In Bourbon County.
 Screven, Fort, Ga.—On Tybee Island.
 Sedgwick Battery, R. I.—At Fort Greble.
 Seminole Battery, Fla.—At Key West.
 Seven Pines National Cemetery, Va.—In Henrico County.
 Sewall, Fort, Mass.—At Marblehead.
 Sheridan, Fort, Ill.—Near Highwood.
 Shiloh National Cemetery, Tenn.—At Pittsburg Landing.
 Ship Island, Fort on, Miss.—12 miles from Biloxi.
 Shipp, Battery, N. C.—At Fort Caswell.
 Sill, Fort, Okla.—At Medicine Bluff.
 Skagway, Alaska.—Near Dyne.
 Slocum, Fort, N. Y.—Near New Rochelle.
 Smallwood, Fort, Md.—At Rock Point.
 Smith, Fort, National Cemetery, Ark.—On Arkansas River.
 Snelling, Fort, Minn.—Near St. Paul.
 Soldiers' Home National Cemetery, D. C.—At Soldiers' Home.
 Southern Branch National Soldiers' Home, Va.—Elizabeth City County.
 Springfield Armory, Mass.—At Springfield.
 Springfield National Cemetery, Mo.—At Springfield.
 Scandish, Fort, Mass.—On Lowell's Island.
 Stark, Fort, N. H.—Portsmouth Harbor.
 Staunton National Cemetery, Va.—At Staunton.
 Stevens, Fort, Ore.—Mouth of Columbia River.
 Stone River National Cemetery, Tenn.—At Murfreesboro.
 Strong, Fort, Mass.—At Long Island Head.
 Sullivan's Island, Batteries at, S. C.—Charleston Harbor.
 Sumner, Fort, S. C.—Charleston Harbor.
 Swift, Battery, N. C.—At Fort Caswell.
 Taylor, Fort, Fla.—At Key West.
 Terry, Fort, N. Y.—On Plum Island.
 Thomas, Fort, Ky.—3 miles from Newport.
 Thompson Battery, Me.—Portland Harbor.
 Tompkins, Fort, N. Y.—Staten Island.
 Totten, Fort, N. Y.—At Willet's Point.
 Townsend, Fort, Wash.—Near Port Townsend.
 Travis, Fort, Tex.—At Bolivar Point.
 Trumbull, Fort, Conn.—At New London.
 United States Powder Depot, N. J.—Near Dover.
 Vancouver, Fort or Barracks, Wash.—At Vancouver.
 Vicksburg National Cemetery, Miss.—At Vicksburg.
 Wadsworth, Fort, N. Y.—On Staten Island.
 Walla Walla, Fort, Wash.—At Walla Walla.
 Warren, Fort, Mass.—Boston Harbor.
 Washakie, Fort, Wyo.—On Shoshone Indian Reservation.
 Washington, Fort, Md.—On Potomac River.
 Watertown Arsenal, Mass.—At Watertown.
 Watervliet Arsenal, N. Y.—At West Troy.
 Wayne, Fort, Mich.—At Detroit.
 Western Branch National Military Home, Kan.—Leavenworth County.
 West Point, Military Academy at, N. Y.—West Point.
 Wetherill, Fort, R. I.—Narragansett Bay.
 Weymouth Battery, Me.—Portland Harbor.
 Whipple, Fort or Barracks, Ariz.—At Prescott.
 Williams, Castle, N. Y.—On Governor's Island.
 Williams, Fort, Me.—At Portland Head.
 Wilmington National Cemetery, N. C.—At Winchester.
 Winchester National Cemetery, Va.
 Winfield Scott, Fort, Cal.—At the Presidio, San Francisco.
 Wingate, Fort, N. Mex.—On the Rio Puerco.
 Winthrop, Theodore, Battery, Mass.—At Grover's Cliff.
 Wood, Fort, N. Y.—On Bedloe's Island.
 Woodlawn National Cemetery, N. Y.—At Elmira.
 Wool, Fort, Va.—Near Fort Monroe.
 Worden, Fort, Wash.—Near Fort Townsend.
 Worth Battery, Fla.—At Fort Pickens.
 Wright, Fort, Wash.—Near Spokane.
 Wright, H. G., Fort, N. Y.—On Fisher's Island.
 Yates, Fort, N. Dak.—At Standing Rock Indian Agency.
 Yellowstone, Fort, Wyo.—In Yellowstone Park.
 Yorktown National Cemetery, Va.—At Yorktown.

Military Prisons, in the United States, penitentiaries or prisons set apart for military convicts. Long term prisoners are sent usually to the military prison at Fort Leavenworth, Kan., or on Alcatraz Island in San Francisco Bay. For small offenses prisoners are confined in the smaller prisons connected with forts and barracks. Most of the prisoners in the Department of the East are confined at Governor's Island, N. Y.

Military Punishments. See LAW, MILITARY

MILITARY RESERVATIONS—MILITARY SCIENCE

Military Reservations, United States, a general term applied to all military posts set aside for military occupation. In most instances large tracts of land surrounding military forts, schools, barracks, etc., are purchased by the government and improved and adorned; buildings, constructed thereon for officers' residences, parade grounds established and works of defense erected. The Presidio reservation in San Francisco is one of the largest in this country. See **MILITARY POSTS, UNITED STATES.**

Military Rule. See **LAW, MILITARY.**

Military Schools, are institutions where soldiers or young men are given a military education. Of the former class, the "soldier schools" of Prussia, established in every regiment or battalion, in which the privates are taught the common rudimentary branches, and sometimes singing also, are the most remarkable. There are similar schools in the Austrian, British, and other European armies. Academies of the second class, intended to educate officers, were not unknown in antiquity, and are now an indispensable part of the military system of all great nations. The first military school in France was established by Louis XV. at Vincennes in 1751; it had 500 pupils, all of whom were young noblemen. The famous school of Saint Cyr was founded by Bonaparte in 1803, and still retains the principal features of its first organization. Even before the Seven Years' war the French had an artillery school in every town where a regiment of that arm was garrisoned. In Germany the education of officers is provided for by high schools for each arm in every army division, and by the royal military school at Berlin, founded by Frederick the Great, to which the most deserving young officers are admitted from the line. In Great Britain the royal military college at Sandhurst, which comprises a cadet's college and a staff college, and the royal military academy at Woolwich, designed as an artillery and engineer school, enjoy a high reputation. A military college was also established by the East India Company at Addiscombe for the education of cadets for their own army. The United States military academy at West Point, founded in 1802, ranks second to no institution of the kind in the world. See **MILITARY ACADEMY, UNITED STATES.**

Military Science, Development of. From a military point of view, the 19th century divides itself naturally into certain well-marked periods. We have first the great era of the Napoleonic wars, closed by the battle of Waterloo. This is followed by long years of peace, broken at last by the Crimean war. The next period to come under notice is that of our own Civil War, in which, in reality, modern conditions of warfare may be said to have taken their rise. The use of independent cavalry, the proper organization of field artillery, the intrenched battlefield, the influence of railways, to say nothing of other particulars now regarded as essential by all military nations, find their first formal expression, if not always their full development, in this great struggle. Recrossing the Atlantic, the next term in the military progress of the century is found in the rise of Prussia, through the defeat of Austria in 1866, as a Power of the first rank, a position confirmed four years later by its complete overthrow of France. Since that epoch, military development, where fostered,

has consisted almost wholly in an imitation, more or less close, of the German system of organization. These last years are marked, moreover, by a hitherto unparalleled application of the arts and sciences to the improvement of the material of war.

It is clear, then, that the growth of the military art during the 19th century has in no wise been a direct function of the time. In some of its most notable aspects the art has developed more rapidly during the past 40 years than it had in the preceding 100. So conspicuously is this true that we may not assert that its state at the opening of the century was even a transition state. In all countries, with the exception of France, the conditions of the 18th had overflowed almost unchanged into the 19th century. The era was that of the great Frederick. His example still bore undisputed sway to such a degree, indeed, that the husk was mistaken for the kernel, the appearance substituted for the reality. The armies of the day were in all essentials hired armies, the soldiers mercenaries, in the sense that war was largely a trade. Organization, recruiting, mobilization, administration, supply, transportation—all these, the life-blood of a modern army, were, if not unknown, at least not understood as they are to-day. They had not as yet been generalized into a continuing system applicable to a state either of peace or of war.

Similarly of arms and of equipment: the flint-lock musket, found in the hands of the troops of all armies, had been for many years substantially a constant quantity, while gunpowder, the only explosive and propelling agent employed, had an unbroken ancestry of centuries of continuous use. The great objective in the training of men, France again possibly excepted, lay in the development of a machine-like precision of drill, and this rigidity was carried so far as to convert maneuvering, even under fire, into a sort of geometrical exercise. On the field, deep columns and serried ranks were the rule. Infantry opened fire at two hundred yards with uncertain, if not innocuous, results at superior ranges. Naturally, under these conditions, cavalry could and did intervene directly in the decision of affairs on the battlefield. The range of field artillery was limited, and, until Napoleon's appearance, its powers and possibilities were not, on the whole, well understood.

The picture changes when we turn to the end of the 19th century. The army is now the "nation in arms"—that is, war is no longer a trade, but a duty, and preparation for war a personal obligation to the state. Upon a declaration of hostilities, at the present day, the effort is made to bring the full strength of the nation to bear, or in other words, mobilization takes place. But this implies a full degree of preparedness, and preparedness, in its turn, a thorough study and application of the principles of organization and training, of supply and administration. Here we touch upon a well-defined characteristic of final as contrasted with initial conditions; preparation for war goes on unceasingly, in times of the profoundest peace, although no possible cause for war can be discerned in any direction. On the material side, the transformation is equally complete. All the possible resources of modern science have been levied on to contribute their share

not only toward the improvement of weapons and of war material in general, but toward supplying the means of placing and maintaining an army in the field. Where 100 years ago but one explosive was known, modern chemical science has supplied hundreds, and the end is not yet. Whereas, in the days of our grandfathers, any respectable foundry could turn out serviceable guns, to-day the gun is the finest product of metallurgical science, and its construction necessarily limited to specialists. Instead of the flintlock, harmless beyond 200 yards, we have the magazine rifle, sighted up to 1,800 yards, and deadly two miles and more away. The muzzle-loading field-piece of limited range and accuracy has given way to the rapid-fire, breech-loading field gun, delivering from 10 to 15 aimed rounds of shrapnel a minute upon a target so distant as to be practically invisible to the naked eye, with an accuracy so great in trained hands that exposure is suicide. Under these conditions the masses of elder days have dissolved into thin lines of invisible skirmishers, and cavalry has all but disappeared from the field of actual conflict. In general, armies have increased vastly in size, and the important battles of the future will probably last for days.

In war, as in everything else, the secret of success lies in organization and preparation. It is interesting, then, to note how two separate and apparently independent conditions have been combined in the evolution of the modern army. The first of these in time, and, with reference to actual combat, in importance, is the creation of the army corps by Napoleon in 1805. What a long step forward this was may be inferred from the fact that Frederick the Great's army was not formed into even brigades and divisions. Besides assuring unity of command, the creation of this strategic unit has led in modern times to the full recognition and definition of the "tactics of the three arms." All modern armies, therefore, whether they belong to military or to unmilitary nations, on taking the field are formed into corps, and these corps are maintained as organic units in times of peace by the great military nations of the world for administrative as well as for purely military reasons.

Hardly less important as leading to a principle of organization was the limitation imposed by Napoleon after Jena upon the size of the Prussian army. This was never to exceed 42,000 men, and, in fact, it never did; that is, at no time while the limitation was in force did Prussia keep more than that number of men under arms. But, thanks to Von Scharnhorst's foresight and intelligence, the members of this army were continually changing. As fast as trained, they were liberated to make room for new and untrained men. With the immediate results of this idea we are not here concerned; what we wish to bring out clearly is that this plan of organization, originally local in both time and circumstances, is to-day fundamental in the formation of the armies of all military states. Indeed, these, if the paradox be permissible, may be said not to have a regular army at all. Great Britain has one, as have the United States, but in all other important nations the condition of universal military service has made the distinction superfluous, if not meaningless, by wiping out one of its terms. Hence, with the exceptions noted, a mold exists, so to say

a form, through which all citizens capable of bearing arms have to pass. From this comes the dictum, "The army is to-day the nation in arms," as distinguished from the purely professional army of the earlier part of the century. The application of the principle of universal service has resulted naturally in a classification of the male population with respect to service. Thus we find in Germany the active army made up of the men with the colors, the reserve of the active army, the Landwehr, and the Landsturm (q.v.). Classes more or less similar exist in other countries under different names, the underlying principle being, however, substantially the same in all. This principle further leads directly to the distinction between peace footing and war footing, passage from the one to the other being effected by mobilization, an operation unknown at the opening of the century. Since, moreover, the whole nation is the army, it results that the modern army has greatly increased in size, a result that would prove embarrassing but for the existence of the staff. It is clear that the formation, instruction, training, supply, and administration of this army form a task of the greatest magnitude. Furthermore, when once formed, if it be not intelligently led and accurately directed upon its objective, it runs the risk, from its mere size, of degenerating into an armed mob. Hence the conditions leading to the formation of the modern army have led, *pari passu*, to the formation of the modern staff. This simply means that by a natural evolution the functions of the staff have expanded until they now include duties not formerly contemplated. Thus the conception of a general staff, whose special business it is during times of peace to study and prepare for any campaign whatever on any theatre of war whatever, is distinctively modern. The existence of such an organization is evidently a necessity due partly at least to the great size of modern armies. This very condition, by increasing the difficulties involved, has suggested the only cure of these difficulties—a body of specialists trained to weigh them in peace and to remove them in war. And so of the administrative staff under the same conditions: the supply of an army, taking that term in its most comprehensive sense, is reduced to a continuously operating system. Obviously this particular question could not be left to look to chance for its answer.

The limits of this article forbid more than a mere mention of the influence of the railway and of the telegraph. Without these, rapid concentration and regular supply would be impossible, a matter of capital importance in view of the great numbers enrolled. It would be hazardous to assert that the railway has been a prime factor in determining these numbers, but there can be no doubt that it has wielded a great influence in this direction. Other things being equal, it is logical and proper to have a large army, because the means of transporting and of supplying a large army are at hand. We are speaking here of railways in a strategic sense.

The art of war is usually defined to consist of two elements, strategy and tactics. Of these, the former is essentially immutable, its principles, few and simple, having remained unchanged throughout the whole course of history. The only recent development in strategy is one, therefore, affecting not its principles, but the

means of applying those principles. The employment of the railway and of the telegraph has greatly increased the rapidity with which strategic combinations may now be carried out, and has added to the number possible within a given time and area. In general, then, strategy is not a measure of the changes occurring between any two given epochs, while tactics, on the contrary, responding sooner or later, if not instantaneously, to any new influence, does furnish such a measure. We shall here briefly consider the tactics of infantry from this point of view, because this arm is still the "queen of battles," and the others have to conform to its possibilities.

To clear the way, let us recollect that the tactics of infantry had remained substantially unchanged from the days of Gustavus Adolphus to those of Frederick the Great; that the latter, by the use of lines in place of columns as a habitual formation, had increased the mobility, and, by the substitution of an iron for a wooden ramrod, the rate of fire, of his troops. As, however, the range of the musket was extremely limited, fire was opened at very short distance, and, independently of any system of tactics, the bayonet was, therefore, a weapon of great importance. Indeed, it might happen on a rainy day that the bayonet was the only weapon available. As was but natural, Frederick's system, known as the "linear" system of tactics, was copied by all other armies.

With the French Revolution came a change. Unquestionably inspired by our own Revolution, in which, for the first time, skirmishers appeared on the field of battle, the French, abandoning the precise linear system, substituted therefor small columns for maneuver and assault, and deployed lines for firing. In maneuvering, skirmishers covered the front, unmasking it as each company arrived on the firing-line. We note at once that this employment of skirmishers is not the modern use, but, nevertheless, it marks the breaking of tradition. The French system, known as the perpendicular, was followed in all Napoleon's earlier campaigns. In 1805, he prescribed that the normal formation of the division should be by "linked brigades," a disposition carrying with it the advantage of giving each brigade a separate objective. This principle is to-day fundamental in combat-tactics, even the company having its designated objective.

Frederick's system, decisively beaten at Austerlitz, was finally overthrown at Jena-Auerstädt, and, in 1813, the tactics of the French, including the use of skirmishers, became universal. But before this the English had adopted a two-rank formation, and had successfully opposed thin lines to the heavy columns which the French, for reasons into which we need not here enter, had apparently found themselves compelled to re-adopt in the Peninsula. In fact, the type-formation was not as yet firmly fixed, the English using heavy columns at New Orleans, and the French, in spite of their experience in Champagne, resuming them with disastrous results at Waterloo.

All the changes here touched upon, it will be noticed, are independent of any change or improvement in weapons, and are simply efforts in the direction of increased mobility and flexibility. Passing by the Crimean war in which, apparently, the experience of the past had been totally forgotten by both sides, we reach our

own Civil War, "remarkable as a turning-point of tactics, there being scarcely a feature of the tactics of the present day that did not have its germ, its prototype, or its development in that great contest." Both armies were now armed with the rifle, the extreme range being one thousand yards, and in the Union army the breech-loader made its appearance before the end of the war. Marksmanship was of a high order on both sides, and infantry fire consequently so deadly as to effect marked changes in tactical formations. These are, briefly, attacks by rushes, attacks in successive deployed lines, the use of heavy lines of skirmishers in place of the old line of battle, and the use of hasty intrenchments. They were brought about by the common sense of the American soldier, who, unhampered by tradition, knew how boldly to adapt his tactics to the confronting situation. The only further comment necessary is that these changes now constitute the normal order in all civilized warfare.

Europe, however, was slow in learning the lessons of our war. In 1866, the Prussians, using the breech-loader against the Austrian muzzle-loader, generally attacked in company columns, preceded by skirmishers, who were ordered to feel and develop the enemy, and not, as at present, to begin and carry on the combat from beginning to end. But the Prussian privates instinctively left their columns to join the skirmishers, with the result familiar to all. Strange as it may seem, the Prussian authorities failed to appreciate the new conditions of warfare, for, deprecating "the disorder and tumult of the impromptu attack-formation, which had sprung into being under the Austrian fire, . . . they waited for the appalling losses of a greater war to emphasize the necessity of a change in their prescribed tactical methods." This experience came in 1870. Both combatants were now armed with the breech-loading rifle, the Chassepot being effective at 1,300 yards. Before the end of the war, under the superior musketry fire of the French, the Germans found themselves compelled to deploy their columns, the direct attack being made, and the hostile position invariably carried, by the rushes of swarms of skirmishers. All the nations of Europe now hastened to bring their tactical systems into agreement with the experiences of the Franco-Prussian war. But it took still another war to drive home the conclusions reached by us in 1861-5. The Turks, in 1877-8, armed with the Peabody-Martini rifle, a weapon vastly superior to any heretofore used, by their use of the American system of hasty intrenchments compelled the Russians finally to deliver their assaults in successive lines of deployed battalions.

This very brief outline shows us that the revolution wrought in infantry tactics during the last half-century has been due almost wholly to the improvements in the rifle. The most recent of these, namely, the introduction of rapid fire through the use of a magazine, will simply carry on the development along the lines already laid down, while the advent of smokeless powder has increased the powers of the defense. All the conditions of the modern combat, therefore, combine to make the frontal attack the exception, flank attack the rule, a principle which is characteristic of modern tactical methods.

But progress has been marked in other

MILITARY SCIENCE

directions as well. We may remark the importance of "combined tactics," or "tactics of the three arms." This, of course, is not a new idea; it has simply received fuller expression through a more stringent application of the principle of division of labor, growing out of the universal recognition of the corps as a strategic unit. As this is really a complete army in itself, though on a small scale, so its full effect can be felt only in case all the arms composing it act in concert to secure the common end. Hence, the powers of the three arms are, perhaps, more accurately measured, their relations to one another better adjusted. The new role of cavalry, too, deserves notice. If it has lost its former weight on the actual battlefield through the power of both infantry and artillery fire, it has gained in consequence of its employment in independent masses. Operating far in advance of the army, it is the purpose of these masses to cover its concentration and to screen its movements, while seeking at the same time to prevent the formation of the hostile forces, and in any case to discover their emplacements, numbers, and objective.

In other ways, too, it has gained. The dismounted fire-action of this arm—that is, its action on foot as in infantry—is now recognized, the alternative being helplessness on the tactical defensive. So highly have we developed this mode of using cavalry in our own country, that many foreign writers have asserted that our cavalry is only mounted infantry. Our answer is that all European mounted troops are either reluctantly or unconsciously conforming to the type of the American cavalryman of 1864-5, without abating one jot or tittle of their right to be, and to be called, cavalry. In England chiefly, a solution has been sought in the creation of mounted infantry. The idea here is that the horse shall serve purely as a means of rapid transportation, his rider dismounting on reaching the scene of action. No better example can be found than that furnished by the British themselves in South Africa, in their attempts to cope with the mobility of the Boers. The reader will recognize at once in the mounted infantry a reversion to the original type of dragoon.

We may fitly conclude this part of the discussion by drawing attention to the increased responsibilities devolved by modern conditions of warfare on the private in the ranks. He has ceased to be considered a machine, mere food for powder, a molecule of the mass whose shock is to crush the adversary. On the contrary, as many occasions will surely arise calling for the exercise of sound judgment, so is he expected to be an intelligent element of the national defense, his value to his country bearing a direct ratio to the degree to which his intelligence can be awakened and trained.

No survey of the military century would be adequate without some reference to the immense development given by the mechanical spirit of the age to the engineering of war. Of course, the impulse in question is not purely military; it is simply the application to war of a principle pervading every other phase of life. In general, every invention that might possibly increase the economy, certainty, or rapidity of a displacement, whether of men, of material, or of projectiles, has been summoned to give its share of improvement. All inventions bearing on the transmission or acquisition of intelligence have

been pressed into service. One of the latter is the balloon—antedates the century, but the idea of photographing the enemy's position from its car is new. So is the application of wireless telegraphy to purposes of communication in the field; this invention is turned to a military end almost before it has definitely left the inventor's hands.

The greatest advance, however, has been in the perfection of man-killing machinery. Upon this one subject have been expended all the resources of modern metallurgical and chemical skill until the projectile weapon of the day, whether gun or small-arm, is a marvel of strength, accuracy, and convenience. From the rude tube of our forefathers we have passed to engines of complicated structure, deadly beyond the limits of unaided vision, and of a rapidity of fire undreamed of even thirty years ago. So great is the volume of fire, so destructive the shrapnel, that in field artillery duels the question of success is reduced to that of being the first to get the range. Each class of guns must now have its special propelling agent, and a serious effort is making to discover some means of launching in safety the frightfully destructive explosives due to modern chemical research.

Side by side with this sort of development has marched that of the art of protection. But here, in contrast with the increasing complexity of the means of offense, we remark the increasing simplicity of the means of defense. At the dawn of the century, the genius of Vauban still prescribed the bastion system for any and all sites to be fortified. Just as in the field, rigid and pedantic notions governed all troop-evolutions, so in fortification the prevailing idea in each case was to furnish a rigid geometrical solution. To-day the idea is first of all to adapt the work to the site, independently of the type. Steel turrets, cupolas, armored casemates, are provided for specially exposed points—a solution made possible by the great general advance in metallurgy. Concrete has displaced masonry, and the face presented to the enemy is always either of earth or, where that is impossible, of steel.

Upon the general question of fortifications, authorities are divided into two camps. Those of the first assert that fortresses cover a mobilization, retard the enemy, allow a defeated army to rest under shelter. Their opponents, on the other hand, maintain that they tie down an army, reduce the numbers of the field armies; that forts will be covered and not reduced, that they will not keep out a superior, and are useless against an inferior enemy; and that a government cannot afford to man them, if the antagonists are otherwise evenly matched. The question will probably always remain open. In the meantime, the frontiers of Europe bristle with forts, and every important capital is the centre of a vast intrenched camp. The great contribution of the century to the question of fortification is not so much one relating to the type, though this is marked, as one relating to the occasion. From hasty or improvised intrenchments these latter days have seen the evolution to such defenses as those of Petersburg and of Plevna, erected not with the deliberation of peace, but under the stress of war, to meet its exigencies as they arise. See FORTIFICATION.

MILITARY SERVICE INSTITUTION—MILITARY ZONES

The conditions now laid down mark the character of modern warfare. As the whole energy of a nation—a constant quantity in each case—is sought to be put forth in the shortest possible time, so the period during which this energy is expended is reduced. We may therefore confidently expect that wars between civilized nations, when carried on by the regularly organized forces, will be short. Naturally no limits can be assigned, for these will vary in each particular case, not only with the military factors involved, but also with others, such as the character of the people and the policy of the combatants, to which no arbitrary value can be assigned. We may feel reasonably sure, however, that the great and increasing complexity of modern life, involving international contacts at an ever-increasing number of points, will combine with the military conditions hereinbefore outlined to reduce the duration of war to the utmost. Whether it will put a stop to war, no one can tell. But it should not be forgotten that this very complexity, in these days of "expansion," may itself prove a fruitful source of conflict. In other words, wars of dynasty, wars to maintain the balance of power, are obsolete; should an armed struggle break out in the future, it will probably owe its origin, as it will certainly owe its strength, to the people. See **MILITARY ZONES**.

C. DE W. WILCOX,
Captain, Artillery Corps, U. S. Army.

Military Service Institution of the United States, a society of officers of the United States Regular Army, organized in 1878 by Generals Fry, Stanley, Rodenbaugh, Colonel Lieber and others. It was designed as a similar organization of the Royal United Service Institution of Great Britain. The presidents of the American Society have been Generals Hancock, Schofield, Miles, and Ruger. The headquarters are at Governor's Island, N. Y., where the Institution has acquired a library of 20,000 volumes including many rare documents. The society issues 'The Journal of the Military Service Institution.'

Military Telegraph, commonly applied to the use of telegraph wires in warfare as in the Civil War when a corps of engineers constructed temporary telegraph lines from the front to points in the rear of an army. In later years this system has been superseded by the heliograph (q.v.) and still later by wireless telegraphy and the use of flag signals commonly known as wigwagging (q.v.).

Military Zones are geographical belts of territory which dominate all wars that have large and diversified areas of operation—and these are as well defined as are the right, centre, and left of corresponding divisions, corps, or armies of each contending command. Baron Jomini credits the chief successes of the first Bonaparte to his skill as well as celerity in the occupation of river and mountain boundaries or positions, as three sides of a quadrilateral, of which the centre is the natural base, the fourth side being that occupied by the adversary. All

campaigns and field operations may partake of these elements of success when strategic conditions evolve their value. The subject-matter under notice has a larger and more generic relation to the broadest possible field of military activity.

During the American Civil War of 1861-5 more territory was traversed, and more combatants engaged in the struggle than in any other of historic record. The entire central and southern portion, from east to west, constituted the theatre of war, and must be thus regarded in considering the main events which culminated in the Union restored. The right zone for the Federal armies was that of the Trans-Mississippi region, while at the same time indicating the Confederate left. Control of the Mississippi River by either was equivalent to that of an impassable mountain chain. The Federal left, and the corresponding Confederate right, were indicated from the Blue Ridge southward, as far as the Savannah River. The centre zone for each army, meaning the entire military force of each, reached the lower Atlantic coast and the Gulf of Mexico. Irrespective of operations by water, the base of the Federal armies, as well as the objective of Confederate operations, was the region immediately north of the Ohio and Potomac rivers. The Confederates sought only to control Southern territory, proper, while the Federal armies were compelled to restore the entire South to the control of the national government.

The initiative taken in 1861 was a partial surprise to the greater and more populous section; but the year 1862 introduced a contest more truly scientific, and yet one where the smaller numbers carried on operations with marked ability upon almost equal terms with the larger force. The accompanying map illustrates all principal operations, their relations to each other, and to the final result. That part of the central zone styled "Semi-Neutral" has special significance, as it controlled a position more vital to general success than any portion of the famous Austrian Quadrilateral of Napoleon's great Italian campaign, or his operations on the Rhone, toward the North Sea. Within its determining range and area, the city of Louisville and its feeders of supply became a factor of almost supreme control. The Kanawha River on the east, with the Tennessee River on the south and west, bounded this tract of country, while the railroad from Richmond, Va., via Lynchburg, Cleveland, Chattanooga, Decatur and Corinth, running behind the Cumberland Mountains, represented an interior line of speedy transit, which greatly aided the concentration of Confederate armies. Their troops fought alternately near Richmond and at the west, while the transfer of two Federal corps from the Potomac to the Tennessee required a detour through Columbus, Ohio, and even through Indianapolis, Ind., because of low water in the Ohio River at a most critical juncture. Federal preparations for that campaign were stupendous. In the Left zone, on 12 January, Burnside with four brigades, gunboats and transports, sailed from Fortress Monroe with sealed orders, attacked Roanoke Island, 8 February, occupied Chowan on the 20th, Washington on the Pamlico River, on the 21st, and Morehead, the same day. In the Middle zone, Thomas was successful at Mill Spring, Ky., 10 January. On 5 February, Admiral Foote

MILITARY ZONES

captured Fort Henry. Buell pressed forward to Bowling Green, and occupied Nashville as soon as Grant captured Fort Donaldson. Columbus, Ky., New Madrid and Island No. 10 soon yielded to Federal control, and the Mississippi River was practically within Federal influence. In the Right zone, Springfield, Mo., was occupied by Curtis, and Price retired to Arkansas. On 7 February, Romney, W. Va., had been occupied by Federal troops, and by 1 April, Charleston, Martinsburg, Leesburg, Winchester, Berryville, Sharpsburg and Woodstock had also been taken. The 8th of March witnessed the wonderful episode of the fight between the Merrimac and the Monitor; and by 1 April the Army of the Potomac, 100,000 strong, was before Yorktown. Meanwhile, Port Royal, S. C., Jacksonville and Pensacola, Fla., had been reached by sea, threatening the Confederate base of supply behind the advanced battle-front. Such, briefly, was the Federal initiative of the campaign of 1862, and Grant had reached Pittsburg Landing on the Tennessee River.

But the Confederate forces were neither idle nor disheartened. General A. S. Johnson proposed to unite the armies of Beauregard, Polk, and Bragg, and strike Grant before Buell could reinforce him from Nashville. Bad weather and other unanticipated events lost three marching days to the advancing Federal armies, so that the surprise and partial rout of Grant's command on 6 April was not fully relieved from danger until Buell's corps brought timely and adequate support that evening. Beauregard fortified Corinth, upon succeeding to command after the death of Johnson, and on 30 April retired in good order from overwhelming Federal forces under Halleck, who succeeded Grant, but did not follow up pursuit. At this time, the military approach to Yorktown, in the Federal Left zone, had been advanced, ready for assault; when, as at Corinth, the Confederate commander abandoned a defenseless position, preserving his force intact, with no loss of prestige or credit. Federal movements on the Chickahominy, with the battles of Fair Oaks, Gaines' Mill and Malvern Hill, brought the army of McClellan to Harrison's Landing, only to be summoned at once to Washington, there to be confronted by the same Confederate divisions which had faced them before Richmond. Stevens was recalled from Port Royal and Burnside from North Carolina. The Confederates had taken the offensive, and forced the Federal troops back upon their original base. A call for 300,000 volunteers and 300,000 drafted men followed. On 15 September, Harper's Ferry was surrendered with 12,000 men. On the 18th, followed the battle of Antietam; and yet, when the army, largely reinforced, sought to renew the fight, it was found, as at Corinth and at Yorktown, that the smaller force had withdrawn from an unequal contest. On 12 November, the Federal army forced the Rappahannock, but was repulsed with heavy loss; and Washington, the Federal capital, was again on the defensive. At the West, equal contrasts marked the issues of the year. On 20 August, Kirby Smith invaded Kentucky, together with Bragg, routed Nelson's army at Richmond, Ky., and seriously threatened both Cincinnati and Louisville. On 19 September, Bragg captured Munfordsville, compelling Buell to return from Nashville to save Louisville from capture and Indiana from invasion. All

public stores were removed to the Indiana shore, and heavy batteries were established to prevent the crossing of the Ohio River in case Buell should not arrive to resist the advance of Bragg. Still farther westward, on 2 December, Grant advanced toward Holly Springs and engaged the enemy, but they withdrew in good order. General Sherman attempted the capture of Vicksburg, and upon an error in report of its capture a salute of 100 guns was fired at midnight at Indianapolis, Ind., but the siege had been raised. On 6 December, Bragg moved from Murfreesboro and captured a Federal brigade. In the Right zone, General Hindman, Confederate, was defeated, practically ending operations in that zone, as those of 8 March, at Pea Ridge, had secured to the Federals a similar success. The close of this eventful year witnessed the memorable battle of Stone River; but for the fifth time the Confederate army was skillfully rescued from the pressure of a superior force, and one within fighting distance.

A brief review is suggestive. Curtis and Pope in Missouri, Grant and Buell in Kentucky, Banks at Winchester, Butler planning the expedition to New Orleans, represented no less than ten armies and as many lines of operation, against each of which the Confederates, from their advantageous positions could, just then, concentrate a superior force. The cry: "On to Richmond" as a prime objective, rather than the destruction of armies in the field, frustrated all the grand plans with which the campaign in the Left zone had opened. In the centre, with the Ohio River as a base, and the semi-neutral zone exposed on three of its faces, there was a division of force that rendered the superior numbers of Federal divisions powerless for determining results. Pope along the Mississippi, Grant along the Tennessee, Buell along the Louisville and Nashville railroad, and another force at Cumberland Gap, represented the miserable features of the campaign. Too much ground was covered. The obvious reason for this was the necessity of protecting citizens who in this region were between two fires of differing political bias. Cities were preserved instead of crushing armies in the field. Bonaparte fought at Austerlitz and Wagram rather than be cooped up in Vienna, and Washington more than once neglected Philadelphia to keep his army fresh for the field. It is at least certain, however, that the campaign of 1862 demonstrated the military ability of the Confederate commanders.

It was one of the most trying hours of President Lincoln's life, when, on 9 July 1862, having ordered Generals Halleck and Pope to report to him, in person, he reached the conclusion that some new man must be found, who could control all Federal forces in the three zones, and through universal supervision, realize universal success. The Cabinet was divided. Chase, Seward, and Wells held a conference at the house of Senator Sprague of Rhode Island, William Cullen Bryant being also invited, but not Mr. Stanton; and Mr. Chase declared that "he would surrender the Portfolio of the Treasury before night, unless McClellan were removed." The writer, a guest at the house, was requested to meet Generals Halleck and Pope at the train, and advise them that they "were expected to accompany the Cabinet from Willard's Hotel to meet President Lincoln, at the Soldiers' Home at ten o'clock in the morning." This was

done. Halleck succeeded McClellan, but the ultimate disappointment was as colossal as was the work to be done.

The campaign of 1862 closed as gloomily for the Federal arms as its opening had been propitious. But its 12 months of vicissitude, rarely, if ever surpassed in human history, had demonstrated that a people who could survive such an ordeal, once reunited, would be invincible against the world. Mistakes were merged in the result. The bad strategy of 1862 yielded to the enormous force which was rallied to meet the sovereign issue, and end the war. In all zones, the pressure began to harmonize and work together. Hood's offensive return in the Middle zone, after the fall of Atlanta, and his defeats by Schofield and Thomas at Franklin and Nashville, ended organized resistance in that zone. When, in addition to control of the sea, Sherman gained the rear of all resisting forces, there was no adequate barrier against Federal success.

For details of the successive acquisitions of territory thereby regained for the Federal Union, see CIVIL WAR IN AMERICA.

HENRY B. CARRINGTON,
United States Army.

Militia. When the Constitution of the United States was adopted, the term militia was understood to have a definite meaning. By that instrument Congress obtained power "to provide for organizing, arming and disciplining the militia, and for governing such part of them as may be employed in the service of the United States. . . . The Constitution also created the President "Commander-in-Chief of the Army and Navy of the United States, and of the militia of the several States when called into the actual service of the United States." The Articles of Confederation had provided, "that every State shall always keep up a well regulated and disciplined militia, sufficiently armed and accoutered, etc." When the colonies united against the mother country they joined their quotas of volunteers from the militia, and with them fought the battles of the Revolution, and eighty years later the great Civil War was fought by the militia, using that term in the sense which the government had adopted. By the Act of Congress passed in 1792, the first exercise of its power, the militia was defined to be all male citizens of the United States between the ages of 18 and 45 years, excepting certain specified exemptions. The term thus used by our original lawmakers, with apparent positiveness as to its meaning and as to a conception of its function, has, of course, an interesting history which in brief follows:

English Militia.—As early as the time of Alfred the Great, the division and organization of society in England comprised the enrolment of the people in bands or companies, commanded by a leader, who was elected in the folk-motes, and called *caldorman* or *earl*, and whose authority extended over the county. "By the Anglo-Saxon laws, or rather by one of the primary and indispensable conditions of political society, every freeholder, if not every free man, was bound to defend his country against hostile invasion." Every ten families, as far as convenient those related to each other, formed a tithing, commanded by the "borsholder" in his military capacity, ten tithings formed a hundred, several

of these forming a trything, or riding, as the word has been perpetuated in Yorkshire. Three public burdens, the *trivoda necessitates*, were imposed upon the citizen, to serve under arms, to repair and construct fortresses, and to make and repair roads and bridges. The Norman Conquest was the means of creating an army made up of bands which attended the king under the command of their immediate lords by "knight service," but that in no way changed the fundamental character of the militia. It was enacted by Henry II. with the consent of Parliament, that every freeman, according to the value of his estate or movables, should hold himself constantly furnished with suitable arms and equipments, the poorest having to provide himself with a "wambais" or linen coat stuffed with cotton, and a lance. In the time of Edward I. the Statute of Winchester defined these requirements more clearly. "Every man between the ages of 15 and 60 was assessed and sworn to keep armour according to the value of his lands and goods; for 15 pounds and upwards in rent or 40 marks in goods, a hauberk, an iron breast-plate, a sword, a knife and a horse. For smaller property less expensive arms. And these provisions were enforced by semi-annual inspections by constables chosen in every 100." From the earliest times the High Constable of the County or Sheriff was the officer by whose authority the citizens were called out, either to drive off predatory bands of robbers, or to assist him when he was in the performance of any duty required by the courts of law. When thus called out for the latter purpose, the body was known as the *posse comitatus*, or power of the county, and to this day the same power is lodged in our office of sheriff and is the ultimate resort of the county officer charged with legal process. The constitutional military force of the kingdom consisted, therefore, of the feudal troops and the *posse comitatus*. But the latter could not be marched out of the kingdom, nor yet out of their shire, except in case of invasion. The sheriff was also charged with the same duty of calling out the militia when the citizens were organized in pursuance of parliamentary enactments, but later when the kings considered themselves to be in need of troops more under their immediate control, he was superseded by Commissioners of Array, although his authority remained unaltered as to summoning assistance for local duties. Prior to the reign of Elizabeth, Lords Lieutenant in the several counties were appointed by the Crown to marshal the militia forces. The people were always exceedingly jealous of their rights, and as a nation insisted more upon pursuing their home labors than upon conquests and achieving glory, and one of the earliest records of this spirit is the enactment in the time of Edward III. made as a restraint upon the infractions of the rights of the people, that no man shall be obliged to equip himself except as has been the custom, and shall not be obliged to leave his shire except when necessity require it for the defense of the realm. Conscriptions and levies were resorted to at times, but were tolerated by the people only when their love for the government exceeded the bounds of resistance or revolution. The civil war of 1642, the result of which was the execution of Charles I., was precipitated and protracted in part by the militia question. The right of the king, as chief executive of the na-

tion, to call the militia into service in time of need, was undoubted, but through the natural jealousy and distrust of Parliament, the power of the king was sought to be curtailed by making the office of Lord Lieutenant irrevocable for two years and giving those offices to the persons approved by Parliament. For six years this was one of the main topics of contention in the wars and negotiations which resulted in the establishment of the commonwealth. The result of the war was to put England under the subjection of Cromwell and his army, and ultimately to fill the people with a great detestation of a permanent military establishment, and the whole course of subsequent legislation upon soldiery was directed with care to avoid the dangers of a standing army. The restoration of 1660 was finally accomplished through the militia of England. To epitomise Macaulay's statement:—It was an exciting time, the flame of civil war was actually rekindled, the nobility put forth their best energies to assemble and train the militia, and train bands were held ready to march in every county. The popular feeling and strength were too great to be disregarded, the old army of 50,000 men was humored as well as intimidated into accepting the unmistakable desire of the nation, and it saw itself destroyed without striking a blow, looking sullenly on the triumphal entry of Charles II. into London, while the militia invested the country with a strength they dared not measure. A force of upward of 180,000 men had been organized to act in this great emergency.

Shortly after the restoration, the Parliament, filled with the idea of how important as well as how trustworthy the militia was, passed a bill organizing it. A horseman was required to be provided, equipped and paid for by every one having an income of £500 a year derived from lands or £6,000 of personal property. And every one whose income or possession was one tenth of those amounts was charged with the equipment and pay of a pikeman or musketeer, and those of less estate were obliged to combine in furnishing horse or foot soldiers. The size of the body of soldiery thus created was estimated at 130,000 men. Regular times for drilling the train bands were appointed, not to exceed 14 days in the year, and the men were not paid by the crown except when called into actual service. For a time, this force became and was a useful and serviceable body, but the influence of the Crown was not lent to perfecting it. The king's desires were rather to obtain possession of an army that could be used to do his bidding however unpopular the acts required might be. James II. was met by the jealousy of Parliament just as Charles I. had been, and it proved for him no less an obstacle. Of a religion that was hated by the mass of the people, and repeatedly thrusting men who were mere tools of the Crown into office, James II. awakened a sense of distrust and opposition; his attempts to raise a regular army, by demands for the necessary appropriations from Parliament, were the occasions of debate upon what the military establishment of the country was and should be. These arguments were renewed pro and contra on different occasions, but the king saw his wishes disregarded when, at the very height of his power, the dangers of a standing army were emphasised by Parliament and a bill to make the militia more efficient was passed at the same time that sup-

plies for the army were granted. The popular feeling was embodied in what was said in Parliament at this time in answer to what the courtiers had to urge in favor of regular troops. Sir Edward Seymour, Sir William Twissden, Sir Richard Temple, and Sir John Maynard, the most learned lawyer of his time, gave vent to these utterances. Said the first of these: The militia might not be in a satisfactory state, but it might be remodeled, and he would rather give a million to keep up a force from which he had nothing to fear than half a million to keep up a force of which he must ever be afraid. The troops enrolled in the regular service, however, continued to increase in number, made necessary through the foreign relations of the English government, but the people accepted the increase reluctantly, always holding fast to the idea of a militia as their real protector. The force of circumstances, when the House of Orange was called to the throne, changed to an extent the feeling of the country in this regard, and danger from foreign foes made soldiers a necessity which the people reluctantly recognized, and without such fear for their domestic content as they had before entertained. The sentiment of the country was again shown when the House of Hanover came to the throne of England, although at this time the regular army had become a permanency, having been continuously provided for on the theory that a standing army was a necessity "for better preserving the balance of power in Europe." In 1757 the militia of England was again reorganised, the impelling motive being that which had always been uppermost in the minds of Englishmen, namely, to take away the pretext for a standing army, and a quota was fixed for each county. The provisions were for five years' service, the position of an officer was made important by proper qualifications, and it was provided that without the exigency of service the companies should not be marched out of their own counties. It was believed that although under the authority of the Crown, the possession of the offices by gentlemen of estates would always insure the services of the militia to the good of the people. This force gradually became, by reason of the limited size, the right given to furnish substitutes, and a progressive necessity to supply pay, clothing, and all other expenses, a feeder for the regular establishment, a distinct species of reserve, and in consequence the free, patriotic and military spirit of the country began to manifest itself by the creation of volunteer organizations. Prior to that time the militia had enjoyed for many years as compared with the regular forces, a social, as well as a constitutional superiority.³ The volunteers now replaced, to an extent, that ancient power. The control of the militia of Great Britain was eventually taken from the county and lodged in the Crown in 1871, and since then the militia has been a part of the regular force. One significant fact may be cited from the reports of 1880, out of 92,677 men of the militia, only 585 were six feet, or over, in height. The volunteers were said to represent the national instinct for defense; Lord Brougham called them a National Insurance; General M'Murdo said they were a great training school of citizen soldiers. The laws of England for many years did not allow Roman Catholics or dissenters to serve in the militia, and a serious contest was made by Wilberforce in 1797 to pass

a bill removing the disability, but in vain, nor was it until 1817 that the service was opened to them.

The foregoing brief reference to the militia of Great Britain is of greater interest than an account of the militia of Greece, of Switzerland, of South Africa, or of any other country, because it is the foundation of our own militarism. In all free or republican countries, the embodiment of the military spirit is shown by the popular ability to bear arms and to organize for war. The transition of nations from a condition of popular military education, discipline and strength, to military powers, possessing large armies, devoted to war for defense or conquest, is a theme beyond the limits of this article.

American Militia.—The peculiar life of the colonies in America rendered it necessary that the colonists should keep themselves armed and experienced in the use of weapons of defense, inheriting the institutions of the mother country, the existence of a militia was an assumed matter in their organization. The adoption of the Constitution of the United States, above quoted, in 1789 was the subject of innumerable debates and political views and prophecies, and the proceedings of the constitutional conventions concerning the adoption of the clauses relating to the militia are most interesting as a matter of political history; space, however, will not permit an account of them. Singularly enough, South Carolina and Virginia were on the side of giving the government greater power, while Massachusetts and Connecticut were opposed to curtailing the State control. Propositions were successively voted down in attempts to frame the Constitution in this regard among others as follows:

- (a) To make laws regulating and disciplining the militia, not exceeding one tenth part in any one year.
- (b) To establish a uniform and general system of discipline for the Militia of the States, and to make laws for arming and disciplining and governing each part of them as may be employed in the service of the United States.
- (c) To establish a uniformity of arms, exercise and organization for the militia, and to provide for the government of them when called into the service of the United States.
- (d) To add to the clause reserving to the States respectively the appointment of the officers, the words "under the rank of General Officers."

We have to bear in mind that the majority tried in many instances to yield the very minimum to the general government of the powers deemed essential to that government, and this fact explains the fragmentary character of the provisions as to the militia. But the conviction was general that the militia must be trained with uniformity, and be so organized as to become a defense to the nation, and that the only authority to provide therefor was the general government. Hamilton in the 'Federalist' fully defended the Constitutional plan. Patrick Henry in Virginia was convinced that ruin would follow the adoption of the law. So much concern was felt regarding the militia that among the ten amendments which were promptly made, and declared to be in force 15 Dec 1791 was that (No. 2), providing "a well regulated militia being necessary to the security of a free State, the right of the people to keep and bear arms shall not be infringed." The State Constitutions and the State laws have from time to time, and invariably, dealt with the militia of the respective States, and are held by the courts to be controlling, so far as not inconsistent with the Fed-

eral laws, but they have not been uniform as to service, duty or organization. They have generally provided for organizing those who wished to volunteer, and the respective Governors of States are Commanders-in-Chief of their militia. It has been demonstrated by time that Congress by the Act of 1792 made an ineffective law, by prescribing uniform duties for the entire male population composing the militia, and though thereafter for over one hundred years the law was retained with slight amendment upon the statute book, it was not enforced and was the subject of repeated efforts at modification. The Presidents of the United States, notably Washington, Jefferson, Madison, Adams, Jackson and Van Buren, in their messages to Congress, urged further legislation to create an efficient militia. Elaborate reports were made from committees in Congress, but nothing was accomplished except that in 1808 an annual appropriation of \$200,000 was begun, which was increased in 1837 to \$400,000, and in 1900 to \$1,000,000. Between 1819 and 1835 various bills and propositions were advanced for a classification of the militia, so that only a small part of it should have duty to perform in time of peace, then a board was convened by the Secretary of War which made a report that was transmitted to Congress, recommending the instruction of officers in camps of instruction, ten days each year. Jackson urged encouraging volunteer organizations. The Secretary of War of President Van Buren's Cabinet, in 1840, proposed that 100,000 men apportioned to the States, be maintained by draft or otherwise, to serve four years, one fourth to go out each year, and to form the reserve, continuing as such four years more. The President to order the active portion on duty 30 days each year, and defray all charges for pay, subsistence etc. It is said that no subject, except finance, was more discussed prior to the Civil War, than the militia. The debates in Congress are full of it, reports and bills are numerous both from the War Office and the committees of the Senate and House, but as stated, they were unacceptable, until after the war with Spain. The language of the Constitution "reserving to the States respectively the appointment of the officers, and the authority of training the militia according to the discipline prescribed by Congress," has always been an insurmountable obstacle to Federal control of the militia in time of peace. As indicated, the Army and Congress long endeavored to secure the adoption of a plan to limit the militia to a practicable number, and the volunteer militia, or that proportion which the States have organized into companies or regiments, has, for many years, been regarded as a practicable number, as indeed it will always be, if motives of patriotism and eagerness to acquire military knowledge, can be made the incentives to volunteer, and it be understood by the people that the government wishes to maintain the force to embody such ideals only.

Military Law of 1903.—In 1903, the United States Congress adopted a new Militia Law, by which the militia was defined to be practically all able-bodied males between 18 and 45 years, divided into two classes, namely (a) "the Organized Militia," being such forces as may be created, under State laws, regardless of the name they bear, and (b) the remainder of the militia. A period of five years is given to all the States to

MILITIA

adopt laws making the organization, drill and discipline of their organized militia the same as that of the regular army, and the participation of the States in an annual appropriation of \$1,000,000 is made dependent on such State action, and the creation of forces accordingly; the limit in number of troops is apparently that of the law as it stood theretofore, to wit, 100 men for each Congressional representative; meanwhile those States which have been entitled to participate in the annual fund continue to do so, and at once their forces became a part of the "Organized Militia." Authority is given to the President to call forth such number of the militia "organized" or "reserve," as he may deem necessary, in case of invasion, danger of invasion, rebellion, or inability to execute the laws of the Union, and any officer or enlisted man who shall neglect to present himself to a mustering officer to be mustered into the service of the United States, if found fit, shall be subject to trial by court martial. No provision is made for such other portion of the militia who may be called forth. The time of such service shall not exceed nine months. The States are required to have each an Adjutant General, whose duties the State laws define, except as to reports to the Secretary of War, these the latter may prescribe. Provision is made for supplying the States on requisition with arms, belts, equipment, ammunition, etc., the same to remain the property of the United States government. The Secretary of War is required to cause annual inspections to be made, and such States as have the requisite organized militia may obtain so much of their allotment from the annual appropriation as shall be necessary to transport, pay and subsist such portion of their forces as shall engage in field or camp service. The Secretary of War may also provide for the participation of any part of the organized militia of any State in any camp or field maneuvers of the regular forces at or near military posts or defenses of the United States. These charges are from the appropriation for the Army. The militia appropriation is also available for stores, supplies, or publications; and States may also buy such property at army listed prices. The annual duty required is prescribed, and regular officers may be detailed to States for duty with the organized militia. Ammunition for firing and target practice may be supplied at regular military posts, and officers of the militia may be allowed to attend at military schools or colleges of the United States, and be examined to be certified for fitness to be commissioned. The application of the law will test the wish of the people to put a particular part or all of the militia under the control of national authority. The questions involved are national control of the militia in time of peace, national participation in the control of the militia, national control of all or part of the militia through the officers of the Regular Army, or national control through some other agency, wholly or in part under direction of the officers of the Regular Army.

National or State Guard.—For one hundred years the militia has been called the State force, being in time of peace under the State, as in England it was under the County; the new law while recognizing the States' control, seeks to secure uniformity and perfection through active national participation in control, and by

the contribution of money and property, and is reported by the War Department to be in process of successful solution. The term "National Guard" has been adopted by some States to designate its organized or volunteer militia. This appellation was adopted by one of the most famous militia organizations of the world, the 7th Regiment of New York, at the time Lafayette visited America in 1824, and in his honor, after the "Garde Nationale." The State of New York appropriated the term in 1862 to describe the organized militia, and other States have followed; but if the organized militia can be made and kept a volunteer body, founded on patriotic service, the term that Massachusetts has used, "Volunteer Militia," is more correct. The organized militia of the States bear names as follows: Georgia, South Carolina and Florida "State Troops"; Arkansas and Kentucky, "State Guard"; Louisiana, "State National Guard"; Rhode Island, "Militia"; Texas, "Volunteer Guard"; Virginia, "Volunteers"; Massachusetts, "Volunteer Militia." The remaining States use the term "National Guard." The War Department U. S. A. publishes a roster of the "Organized Militia of the United States," dated October 1903, showing a total force of 116,542 officers and enlisted men. A table compiled by Captain W. R. Hamilton, U. S. A., to 1 Dec. 1902, showed the State militia to comprise 1,791 generals and officers of their staffs, 4,951 cavalry, 6,671 artillery, 96,808 infantry, making a total of 110,221, for which the State appropriations were \$2,639,150 in addition to the national appropriation. The total number liable to military service is estimated at 8,727,500 men. The naval militia of the States aggregated 1 Jan. 1902, 433 officers and 4,447 petty officers and men. Heretofore militia of the United States meant militia called into the service of the United States. The volunteer militia of many of the States, notably New York, contain some military organizations so excellent in drill, discipline, rifle shooting and general military proficiency as to be easily comparable with corresponding bodies in the regular service. This is attained by the work of men who are fond of military labors, and who have patriotic pride in performing them, and by those who know how to utilize such elements in the community. As the officers and men maintain themselves, and oftentimes those dependent upon them, and have civic and social ambitions, as well as those of a military character, it is necessary to be judicious in selecting and managing volunteers, in order to inculcate military knowledge and maintain zeal for public service. It will thus be seen that the subject of the militia is a political, economic and patriotic question of statecraft. The military sciences and their representatives enter because the question relates to the embodiment of national force, but they enter only for the perfection of a result and not for its creation. The Chief Executive of a nation is its Chief Commander, but the military power is subordinate to the civil power, except when the military power must be exercised. Asserting that this should be always kept in mind, Hallam says: "Nothing would more break down this notion of the law's supremacy than the perpetual interference of those who are really governed by another law; for the doctrine of some judges that the soldier being still a citizen, acts only in preservation of the public peace, as another is bound to, must be

MILITIA—MILK

felt as a sophism even by those who cannot find an answer to it."

Bibliography.—Concerning the English institution consult Edward, Earl of Clarendon, 'History of the Rebellion and Civil Wars in England'; Napier, 'Defence of England by Volunteer Corps and Militia'; Chamberlayne, 'State of England'; Grose, 'Military Antiquities respecting a History of the English Army'; Hallam, 'Constitutional History of England'; Macaulay, 'History of England'; Townshend and Windham, 'Plan of Discipline for Norfolk Militia' (1760); and for the United States, reference may be made to Elliott's 'Debates,' Curtis' 'Constitutional History of the United States,' American State Papers (Military Affairs), Congressional Debates, Reports of Secretaries of War, and of Congressional Committees, Messages of Presidents to Congress, opinions of Attorney Generals, and numerous Court decisions, both in the Federal and State Courts. Among the former, reference should be made to the opinions of Justices Washington, Johnson and Story (in *Houston v. Moore*, 5 Wheaton, 1), of Justice Story (in *Martin v. Mott*, 12 Wheaton, 19), of Chief Justice Taney (in *Luther v. Borden*, 7 How., 1).

CHARLES E. LYDECKER,
Major National Guard, New York.

Militia, Naval. See NAVAL MILITIA.

Milk may be defined as the normal secretion of the mammary glands. The milk of all mammals is similar in qualitative composition, consisting essentially of water, fat, proteids, milk-sugar and salts or ash. Colostrum, the fluid secreted for a short time immediately after giving birth to the young, is composed of similar substances, but differs considerably from normal milk in its quantitative composition and physiological properties. The average percentage composition of some of the more important milks is approximately as follows:

	Water	Fat	Proteids	Sugar	Ash
Human milk.	88.00	3.80	1.50	5.40	0.30
Cows' milk...	87.00	4.00	3.25	4.90	0.75
Goats' milk...	85.70	4.75	4.20	4.45	0.80
Ewes' milk...	80.80	6.85	6.55	4.90	0.90
Asses' milk...	89.50	1.75	2.00	6.25	0.50
Mares' milk...	90.75	1.80	2.00	5.70	0.35

Human milk varies to such an extent that any attempt to state its average composition is liable to be misleading. The percentage of any constituent, and especially that of proteids, may differ widely from that given above while the milk is still entirely normal. Such differences are found not only in the milk of different women but in that of the same woman at different periods of lactation.

Cows' milk differs from human milk in containing less sugar and considerably more proteids and ash. The proteids are also of a somewhat different character, the casein being more easily coagulated and forming a denser curd. Goats' and ewes' milks being rich in fats and proteids are well adapted to the manufacture of cheese and are largely used for this purpose in some parts of Europe. Asses' and mares' milks have been recommended as preferable to cows' milk for infant feeding, since they show some resemblance to human milk in the

amount and nature of the proteids which they contain. In this country, however, the milk of the cow is the only one of commercial importance. Unless otherwise explained all of the statements which follow will be understood to refer to cows' milk, but many of them are true of the milk of other mammals as well.

Cow's Milk.—The constitution of cows' milk has been concisely stated by Richmond: "It is essentially an aqueous solution of milk-sugar, albumin and certain salts, holding in suspension globules of fat, and in a state of semi-solution, casein together with mineral matter. Small quantities of other substances are also found." As regards its physical properties, milk is an opaque, white or yellowish fluid, somewhat heavier and more viscous than water, having a faint characteristic odor and a slightly sweetish taste. The yellowish color is due to the fat and the opacity and viscosity in part to the fat and in part to the casein and lime salts present. The specific gravity is usually between 1.029 and 1.034 at 15.5° C. (60° F.). Normal fresh milk shows toward litmus an amphoteric reaction, and reacts acid with phenol-phthaline. This property is attributed to the presence of phosphates and of carbonic acid. The gases contained in cows' milk, carbonic acid with small amounts of oxygen and nitrogen, are for the most part evaporated in the usual processes of handling the milk and therefore need not be further considered here.

Proportions of Water and Solids.—The proportion of water in cows' milk varies considerably, depending upon breed, individuality, period of lactation, etc. While the average amount is about 87 per cent, the mixed milk of a herd may easily show as much as 88 or as little as 85 per cent of water corresponding respectively to 12 or 15 per cent of solids. The milk of a single healthy cow in normal condition may sometimes contain as little as 10 or as much as 18 per cent of solids, while in extreme cases even these latter limits may be passed. The writer has found 19.88 per cent of solids in the milk of a perfectly healthy cow and 27.40 per cent in that of a cow having fever. Over 16 per cent of solids in the mixed milk of a herd or over 18 per cent in that of an individual is, however, comparatively rare.

Breed.—While much depends upon the individual cow, it is well known that some breeds tend to yield richer milk than others. The following figures, obtained by averaging the records of tests made at the New York and New Jersey Agricultural Experiment Stations, serve to illustrate the variation in richness of milk yielded by different breeds:

Breed	Total solids per cent.	Fat per cent.	Solids not-fat per cent.
Jersey	14.87	5.19	9.68
Guernsey	14.69	5.16	9.53
Shorthorn	13.38	4.05	9.33
Ayrshire	12.73	3.64	9.09
Holstein	11.98	3.43	8.55

Advance of Lactation.—After the third or fourth month, the milk tends to increase in richness as lactation advances. A study of nearly fifty lactation periods of individual cows at the New York State Experiment Station, yielded the following average results, the observation being continued in each case for ten months:

MILK

Months	Total solids per cent.	Fat per cent.	Solids not-fat per cent.
First month.....	14.00	4.54	9.46
Second month.....	12.50	4.33	8.17
Third month.....	13.47	4.28	9.19
Fourth month.....	13.64	4.39	9.25
Fifth month.....	13.75	4.38	9.37
Sixth month.....	14.00	4.53	9.47
Seventh month.....	14.18	4.56	9.62
Eighth month.....	14.33	4.66	9.67
Ninth month.....	14.46	4.79	9.67
Tenth month.....	14.83	5.00	9.83

In the last few days of lactation, when the yield becomes very small, the proportion of solids often rises to a marked degree, sometimes reaching 20 per cent or over.

Food, Weather, etc.—Other conditions being the same, milk is richer in winter than in summer, in cooler than in warmer weather, and on rich dry food than on pasture, except that on first turning the cows to pasture a richer milk may be obtained for a time. Probably anything which induces a greater consumption of food has a tendency to increase at first the richness of the milk secreted. In most cases, however, such increase in richness is found to be only temporary, the more permanent influence of better feeding being to improve the quantity rather than the quality of the milk produced.

Partial Milking.—All of the statements regarding the composition of milk refer to the product of a complete milking. In partial or fractional milking the first portions drawn are comparatively poor and the last portions or "strippings" are much richer.

Milk Fat.—Milk fat, like other fats, is a mixture of glycerides (compounds of glycerine and fatty acids). It differs from other animal fats in containing a smaller proportion of stearic acid and large proportions of the acids of lower molecular weight. A recent study of the constitution of milk fat by Browne gave the following results:

Acid	Per cent of acid obtained	Corresponding per cent of glyceride
Oleic	32.50	33.95
Dioleostearic	1.00	1.04
Stearic	1.83	1.91
Palmitic	38.61	40.51
Myristic	9.89	10.44
Lauroic	2.57	2.73
Capric	0.32	0.34
Caprylic	0.49	0.53
Caproic	2.09	2.32
Butyric	5.45	6.22
Total	94.75	100.00

The last four acids are the "volatile fatty acids," the large amount of which serves to distinguish milk fat (butter) from other fats which as a rule have only a fraction of a per cent of these acids. In the milk the fat exists in the form of minute suspended globules which vary considerably in size but average about $\frac{1}{1000}$ of an inch in diameter. A drop of average milk contains over 100,000,000 fat globules. Formerly it was believed that each globule was surrounded by an envelope of proteid matter, but it now appears certain that no such envelope exists and that the fat particles float freely in the milk in the form of an emulsion.

Amount of Fat in Milk.—The percentage of fat in milk varies more than that of any other solid constituent, or indeed, of all the other solids combined. In the mixed milk of herds where the influence of individual cases of advanced lactation is minimized, we may consider the usual range to be from 3 to 6 per cent of fat and from 8.5 to 9.5 per cent of solids not fat. Hence the varying richness of cows' milk is due principally to differences in fat content, and as fat is also the constituent of greatest pecuniary value, a "rich" milk is essentially one containing a high percentage of fat.

Nitrogenous Compounds or Proteids of Milk.—Not all of the nitrogenous compounds found in milk are true proteids, but since the amount of nitrogen in other forms is exceedingly small, it has become customary to use the term proteids or "protein" as synonymous with nitrogenous compounds. The number of such compounds which have been reported as occurring in milk is quite large. Some of these, however, are accidental or abnormal constituents and others occur only in very minute quantities. The greater part of the nitrogen in milk (usually over three fourths) is in the form of casein, a compound proteid which contains phosphorus in organic combination and is probably also combined with lime salts. Casein is readily coagulated by acids or rennet and the curd thus formed encloses the greater part of the fat which the milk contained. Of the nitrogen compounds other than casein, albumin is by far the most abundant. Milk albumin is not coagulated by rennet, nor by acids at ordinary temperatures, but is coagulated by heat. In addition to casein and albumin, milk contains small amounts of other proteid bodies including the enzymes or unorganized ferments which play an important part in cheese-making, and probably aid the digestion when milk is consumed in the fresh state without previous heating. Among the nitrogenous compounds other than proteids which have been found in milk, may be mentioned small amounts of lecithin, hypoxanthin, creatin or creatinin, urea, and traces of ammonia.

Amount of Proteids in Milk.—Formerly, through faulty methods of separation, the reported percentages of proteids were very often inaccurate and were usually too high. The amount of proteid matter as determined by modern methods is usually between 3 and 4 per cent, being higher in those samples which are rich in fat. Average milk with 13 per cent of solid matter usually contains about 4 per cent of fat and $\frac{3}{4}$ per cent of proteids. In richer milk the increased amount of solids is usually made up of about three fourths fat and one fourth proteids. In other words, the percentages of fat and proteids tend to rise and fall together approximately in the proportion represented by the formula—Proteids = $2.00 + \frac{1}{2}$ Fat. Variations in fat, especially if due to temporary causes, are not always accompanied by so much variation in proteids as the formula would indicate. On the other hand, the percentage of proteids is apt to exceed that indicated by the formula, in very advanced lactation. As a rule when the amount of solids-not-fat exceeds 9 per cent, the excess is due chiefly to excess of proteids.

Milk-Sugar.—Milk-sugar, or lactose, has the same composition as cane-sugar, but differs from the latter in some of its chemical properties and

MILK

is less sweet and less readily soluble in water. The amount of sugar is rather more constant than that of proteids, being usually between 4.5 and 5.25 per cent in normal milks. While the latter figure is rarely exceeded, occasional samples may show considerably less than 4.5 per cent. In any genuine milk containing an unusually low percentage of solids-not-fat, the deficiency is apt to be principally in the milk-sugar. Such milk is apt to be yielded in case of fever or unusual excitement or fatigue, and may sometimes be obtained from apparently healthy cows under normal conditions, especially during hot, dry weather.

Salts or Ash of Milk.—When milk is dried and burned there remains a white ash, the average composition of which is stated by Fleishmann and Schrodt to be:

	Per cent
Potassium oxide	25.42
Sodium oxide	10.94
Calcium oxide	21.43
Magnesium oxide	2.54
Ferric oxide	0.11
Sulphuric anhydride	4.11
Phosphoric anhydride	24.71
Chlorine	14.60
	103.25
Less oxygen equivalent to chlorine.....	1.28
	100.00

A part of the phosphoric anhydride of the ash is derived from the phosphorus of the casein. The sulphuric anhydride also comes from the oxidation of the milk proteids. If these acid constituents are deducted, the bases in the ash are found to be in considerable excess. In the milk these bases are combined partly with the casein and partly with citric acid, a very small quantity of the latter being a normal constituent of cows' milk. The amount of ash does not, therefore, exactly represent the mineral matter originally present. The ash of normal milk is usually between 0.65 and 0.80 per cent, averaging about 0.73 per cent. The ash tends to vary with the proteids approximately in the proportion—Ash = $0.38 + 1/10$ Protein.

Preservation of Milk.—Milk produced under usual conditions contains large numbers of bacteria. At ordinary temperatures these multiply rapidly and soon cause such changes as to render the milk unsalable, if not unfit for use. Various preventive measures may be adopted, either to prevent bacteria from getting into the milk, to check or control their growth, or to destroy them entirely. Strict cleanliness and the use of sterilized utensils exclude a large proportion of the bacteria usually present in milk and greatly improve its keeping qualities. If such milk is protected from access of air and kept cold, it will remain sweet and fresh for at least two or three weeks without any other preservative measures. The sanitary production and handling of milk are more fully described in the article: DAIRY INTERESTS, AMERICAN. In this respect the American dairy practice is much in advance of that of other countries, as was strikingly shown at the exhibit of dairy products at the Paris Exposition of 1900. Three dairies engaged in city milk supply, one in New York, one in New Jersey, and one in Illinois, sent regular shipments of fresh milk and cream to Paris throughout the summer. These products were found to be sweet and sound when opened from 15 to 20 days after bottling, and it was

only with great difficulty that European dairy experts could be convinced that nothing but "cleanliness and cold" had been used to preserve them. No other country except France attempted to show natural milk and cream and the French exhibits were all sour on the second or third day.

It is evident that milk may be preserved much longer than is usually necessary by the observance of cleanliness to exclude bacteria as far as possible and the maintenance of a low temperature to retard the growth of those present. In order to preserve milk produced under unsanitary conditions or which has been carelessly handled and not kept properly cold, it is sometimes necessary to adopt other methods to kill the bacteria present or to retard their growth. For this purpose milk is either heated or treated with chemical preservatives.

Sterilization and Pasteurization.—When milk is heated to the boiling point, all active bacteria are killed. Such milk is commonly called "sterilized," but is not strictly sterile because of the presence of spores which subsequently develop into active bacteria. In order to render milk absolutely sterile, it must be heated several times at intervals until all of the spores have developed into bacteria and been killed. Boiled milk is somewhat changed in appearance and has a "cooked" taste, which is unpleasant to most people. Heating to a temperature of 140° F. destroys the greater number of the bacteria usually found in milk, including any disease germs likely to be present and all those species to which the ordinary souring of milk is due. This process is called pasteurization. It is very generally practised abroad and until recently has been advised by many writers in this country. But the recommendations for pasteurization made by European writers have little application in America, where a better milk supply is available and ice is much more freely used, and it is now known that the pasteurization of milk is attended with serious disadvantages. Thoroughly pasteurized, or ordinary so-called "sterilized," milk will seldom sour, but unless kept very cold certain spores which are often present will germinate and produce bacteria which attack the proteids, forming products more or less poisonous, which are believed to be the cause of many of the digestive disorders, especially of infants and children. In natural milk such products are rarely formed in any appreciable quantity, because the more rapid growth of the lactic acid bacteria prevents the development of those species which attack the proteids. The heating of milk tends in itself to change the proteids somewhat and render them slightly less digestible, at the same time destroying the activity of the enzymes present which are believed to aid digestion. It is evident, therefore, that the heating of milk to improve its keeping quality is not to be recommended where ice is obtainable, and that when pasteurization is resorted to through fear of disease germs, the milk should nevertheless be kept cold until used. The public should demand milk produced under such known and satisfactory conditions as to make pasteurization wholly unnecessary.

Chemical Preservatives.—Various substances have the power of preventing or retarding the growth of bacteria. Those most often used to prevent milk from souring are boracic acid or borax, and formaldehyde. Less frequently

MILK

salicylates, chromates, fluorides, and other substances may be found. All of these substances are highly injurious when taken in sufficient quantity and their use is illegal in most States, but they are often sold under fanciful names and doubtless frequently used without knowledge of their real nature. According to the Year-book of the United States Department of Agriculture for 1900, boric acid and borax are sold as "Preservaline," "Superior Preserving Powder," "Nonpareil Preservative," "Australian Salt," "Antisepticum," "Antisourine," "Ozone Antiseptic Compound," "Rex Magnus, Snow Flake Brand," etc.; Formaldehyde or "Formalin" as "Freezine," "Ice-line," "No Ice Needed," "M" Preservative, "Patent (M) Preservative," "Milk Sweet," etc. The strongest incentive to the use of such preservatives is the saving of ice, and it is safe to say that as a rule their use tends to encourage carelessness and neglect not only as to refrigeration but as to cleanliness as well. The attempts to determine the exact physiological effects of small amounts of these substances have given somewhat conflicting results, and the claim is sometimes made that the quantities which would be used as food preservatives would not be sufficient to cause any injury to health. It may, however, be accepted as a general principle that any substance which prevents fermentation to such an extent as to be useful as a preservative must to some extent retard the action of the digestive ferments, and it is entirely probable that an amount too small to have an appreciable effect upon a healthy adult might be highly injurious to an infant or an invalid. Since milk often forms the sole food of infants and invalids, the use of chemical preservatives is more highly objectionable in milk than in other foods and should be strictly prohibited.

Milk is sometimes treated with carbonate or bicarbonate of soda which neutralizes the lactic acid which would otherwise make the milk sour. These substances do not check the growth of bacteria but simply mask the results of their activity. By neutralizing the lactic acid they favor the growth of the bacteria which attack the proteids as well as those which affect principally the milk-sugar. Such milk, therefore, tends to become unwholesome more rapidly than milk to which nothing is added.

Methods of Analysis and Detection of Adulterations.—The complete analysis of a sample of milk requires much time and elaborate apparatus and is not practicable for others than trained chemists. The tests described below are more easily performed and if carefully carried out will in many cases yield all the information required. Before taking a portion for any determination the milk to be tested should be thoroughly mixed by repeatedly pouring it from one vessel to another.

Determination of Fat.—Since fat is both the most valuable and the most variable of the solids in milk, its determination is often required. This may be accomplished by the method devised by Dr. S. M. Babcock, of the Wisconsin Agricultural Experiment Station, and popularly known as the Babcock test. In making this test, a measured amount of milk is treated with about an equal volume of commercial concentrated sulphuric acid which dissolves the other constituents, leaving the fat free in a heavy solution from which it is separated by centrifugal

force and collected in the graduated neck of the test bottle, where its volume is read off at once on the completion of the test. Complete directions are furnished with the testing outfit, which can be purchased for a few dollars from dealers in chemical apparatus or dairy supplies.

Determination of Specific Gravity and Estimation of Solids-Not-Fat.—Since the specific gravity of milk is raised by all of the other solids and lowered by the fat, it follows that after the influence of each has been determined, it should be possible to estimate from the percentage of fat and the specific gravity the percentage of solids-not-fat which the sample contains. To determine the specific gravity it is convenient to use a "Quevenne" or a "Sohlet" lactometer, either of which is practically a hydrometer of sufficient range to cover the gravity of all ordinary milks and so graduated that the thousandths in excess of unity are represented by whole numbers on the scale. Thus a milk with a specific gravity of 1.0315 will give a lactometer reading of 31.5. The temperature should be observed at the same time with the lactometer reading and the latter corrected to 60° F. by adding to the reading 0.1° for each degree F. above the standard temperature of 60° F. One fourth of the corrected lactometer reading plus one fifth of the percentage of fat gives a fairly close approximation to the percentage of solids-not-fat. The lactometer reading may also be useful aside from the estimation of solids-not-fat. Although the addition of cream to milk would lower the gravity, yet in general the lactometer reading is a rough indication of the richness of the milk, because a high percentage of fat is usually accompanied by a high percentage of proteids which raises the lactometer reading. Cases in which genuine milk shows a low gravity as the result of a high percentage of fat are not common and can usually be detected by noticing the viscosity and opacity of the milk as it runs from the bulb of the lactometer. The lactometer reading taken in connection with the appearance is therefore a useful preliminary test and is used as such by the milk inspectors of many cities.

Detection of Skimmed or Watered Milk.—The most common adulterations of milk are the removal of cream (or the addition of skimmed milk, which amounts to the same thing), and the addition of water. For the detection of such practices there are no satisfactory direct tests. Milk which contains less than 3 per cent of fat has usually been partially skimmed, and milk containing less than 8.5 per cent of solids-not-fat has usually been watered, but poorer samples of genuine milk are occasionally found. In most States there are minimum limits established by law and milk falling below the limit is considered to be adulterated. Thus in New York State milk must contain at least 3 per cent of fat and at least 12 per cent of total solids; in Georgia at least 3.5 per cent of fat and 8.5 per cent of solids-not-fat. As stated above, the percentage of fat varies much more than that of solids-not-fat. Skimming is therefore more difficult to detect than watering. In fact, it is usually impossible to distinguish by analysis between a genuine sample containing, say, 3.6 per cent of fat and a sample originally containing 4.5 per cent of fat, one fifth of which has been removed. On the other hand, the addition of 20 per cent of water would almost certainly

MILK-CURE—MILK-SICKNESS

reduce the percentage of solids-not-fat to a figure considerably below the normal minimum.

Other Adulterants.—The addition of chalk, calves' brains, etc., though frequently mentioned in the older works on food adulteration, is now almost unknown. Cane-sugar or starch may sometimes be added to mask the effect of watering. The former may be detected by the rose-red color produced when about 10 cubic centimetres of milk are boiled for five minutes with 1 cubic centimetre of hydrochloric acid and 0.1 gram of resorcin. To detect the presence of starch, boil about 10 cubic centimetres of milk, cool it thoroughly and then add a few drops of a solution of iodine in potassium iodide. If starch is present a characteristic blue color will be produced.

Artificial Coloring Matter.—Caramel or yellow coloring matter such as is commonly used in butter may occasionally be added to milk. The detection of these is of little practical importance, since they would ordinarily be used only to mask the effects of gross skimming or watering such as would be readily detected by the methods already given.

Detection of Heated Milk.—It has already been stated that milk contains enzymes, the activity of which is destroyed by heating. At least one of these has the property of decomposing hydrogen peroxide with the liberation of nascent oxygen. This property forms the basis of several tests for distinguishing between raw and heated milk. According to Leffmann the best reaction is obtained with 1-4 diamidobenzene. When a freshly prepared dilute solution of this substance is added to raw milk and then a few drops of hydrogen peroxide solution, a deep blue color at once appears. Milk which has been heated to 180° F. does not give this reaction.

Detection of Preservatives.—**FORMALDEHYDE** ("FORMALIN").—Dilute the milk with an equal bulk of water in a test tube and carefully pour in commercial concentrated sulphuric acid, inclining the tube so that the acid and milk will not mix. If formaldehyde is present a violet ring forms at the junction of the two liquids. If pure acid is substituted for the commercial, a trace of some ferric salt should be added. **SALICYLIC ACID.**—To 50 cubic centimetres of milk add an excess of an acid solution of mercuric nitrate, shake and filter. Shake the filtrate with ether in a separatory funnel, separate, evaporate the ether layer and to the residue add a drop of neutral solution of ferric chloride. In the presence of salicylic acid a violet color is produced. **BORACIC ACID OR BORAX.**—Evaporate a portion of the milk to dryness and burn to ash. Moisten with a few drops of dilute hydrochloric acid and introduce a slip of yellow turmeric paper. This is turned reddish brown by boracic acid and the color may be changed to bluish black by treating with a solution of sodium carbonate. **CARBONATES OR BICARBONATES** if present in the milk would remain as carbonate after ignition and be shown by an effervescence when the ash was moistened with acid in the test for boracic acid just described.

H. C. SHERMAN, PH.D.,
Columbia University, New York.

Milk-cure. The living on milk alone, or mainly, for weeks is a recognized form of treatment in obstinate hysteria, hepatic congestion, dropsy, and various disorders of nutrition. When the taste of milk becomes disagreeable, salt, coffee, bread, arrowroot, cocoa, rice, etc., may be added as the attending physician decides. The sole use of milk for a length of time may increase the frequency of the pulse, stimulate the kidneys to undue action, coat the tongue, and produce obstinate constipation. When used exclusively, two or more quarts are ordinarily consumed daily. It is not a cure to be undertaken without the supervision of a physician.

Milk-fever (called ephemeral fever when the symptoms disappear very quickly) is a febrile state, the temperature reaching 102° F. or over, occurring in the mother usually two or three days after delivery. It chiefly affects those in a feeble condition or under- or over-fed, or in whom the milk-ducts have not been freed by early lactation. A chill may induce it. It occurs in the lower animals as well as in the human being. It begins with rigors, which are followed by headache, pains in the limbs, fever, swelling and tenderness of the breasts (going on, it may be, to abscesses), and sweating, when the symptoms abate. Pain is to be relieved by hot-water bottles, breasts to be emptied, bowels moved by salines, and fever reduced by diaphoretics; other medicines may be necessary. Owing to antiseptic midwifery, and greater care as to hygienic measures, milk-fever is now-a-days comparatively rare. If not relieved promptly by medical skill, it may prove a dangerous disease.

Milk, Human. This liquid has a specific gravity of 1028.34, and contains water, 87.4; total solids, 12.6; fat, 3.4; albuminoids, 1.3; sugar, 7.0; ash, 0.2. It is slightly alkaline, is sterile, and differs mainly from cow's milk in being sweeter and having less fat and casein. Its fat is more fluid, and the casein is more readily dissolved. Cow's milk is frequently acid, and its casein is often digested with difficulty. Experience shows that an infant should, if possible, be nursed during the earlier months of its life, for human milk is usually adapted to the digestive powers of infants. Its alkalinity, its temperature (98°-100° F.), its chemical constituents aid the development of the child. But poor health of the nurse, mental emotions, improper food, or deranged digestion of the infant may prevent natural feeding or require its cessation.

Milk-leg. See PHLEGMASIA.

Milk-sickness (sometimes called 'trembles'), a malignant fever attacking man and some of the lower animals, such as unweaned

MILK SNAKE—MILL

calves and their mothers, horses and colts, sheep and goats. Formerly it prevailed in the Western and Southwestern States, recently in North Carolina and Indiana. The cause is not known, though supposed to exist in poisonous herbs eaten by cattle. Man is supposed to be infected by the products of cattle—meat, milk, cheese, or butter. The disease belongs to the end of summer and the beginning of autumn. The symptoms are headache, loss of appetite, fatigue, nausea, vomiting, thirst, constipation; a foul breath, then a typhoid condition with coma or convulsions. The prognosis is generally favorable, but death may occur in a few days. The duration of the disease is from two or three days to as many weeks. The treatment is supportive and symptomatic.

Milk Snake. See **HOUSE-SNAKE**.

Milk Stone, or **Galalith**, an artificial substitute for horn, ivory, ebony, amber, etc., made of casein by the following process. Curds are dissolved in hot soapy water, and colored to the proper tint. A precipitate is obtained by a metallic salt; this is thinned and dried on a cloth-covered frame. The resulting mass is rendered insoluble by the addition of formaldehyde. Milk stone is cheaper than the natural materials for which it is a substitute, and is less odorous and inflammable than celluloid.

Milk-tree, any of various tropical trees yielding a milky, wholesome sap. See **COW-TREE**.

Milk-vetch, a pea-plant of the genus *Astragalus* (see **VETCH**), regarded as increasing the flow of milk when eaten by goats. Many species grow in the United States, especially on the Western plains, where they are useful fodder-plants, although including one baneful species, the locoweed (q.v.).

Milkweed. See **ASCLEPIAS**.

Milkweed, or **Monarch Butterfly**, a large, reddish-brown, black-veined nymphalid butterfly (*Danix plexippus*) of North America. Its black and green caterpillars, which have a pair of black filaments at each end of the body, are found upon milkweed almost throughout the world. The bright green, gold-dotted chrysalids hang from the under sides of the leaves in mid-summer. The adults which are among the strongest flyers of their order, migrate southward in the autumn and hibernate. In spring they fly northward even into Canada. They often form immense flocks in glades, even concealing the bark of trees upon which they alight in the lee of the wind. They are protected from their enemies by scent scales and are imitated by species not so protected, especially in the United States by the viceroy butterfly (*Easilorchia disippus*).

Milky Way, **The**, or **The Galaxy**, in astronomy a luminous band of irregular form, consisting of a great circle entirely surrounding the heavens. It contains myriads of stars, so crowded together that their united light only reaches the unaided eye; this band of stars can be seen on any dark, clear night. If we could stand where the earth is and have it removed, we could see this splendid circle completely surrounding us; it is thus reasoned that we are a part of the Milky Way, and that our sun is near the centre of it. The circumpolar constellations Cassiopeia and the Swan are always to be found in the Milky Way, while Sirius,

Capella, and Aquila may be seen on its edge when they are in sight. The formation of the Milky Way assumes the general appearance of a silvery ribbon, but in places it is divided into two great branches, which afterward reunite. Between these divisions are dark places comparatively devoid of stars; one of these, the Coal Sack, has become celebrated, and was so named by sailors because they could see no stars in this dark spot.

Mill, James, British economist, historian, and utilitarian philosopher: b. Northwater Bridge, Forfarshire, Scotland, 6 April 1773; d. Kensington 23 June 1836. His father was a cobbler, his mother a farmer's daughter, and his early abilities were so marked that great care was taken with his education, so that in 1790 he entered Edinburgh University. There he was carried away with Dugald Stewart's philosophy until he came to know Bentham's system, which he then adopted. But in the University he was better known as a remarkable Greek scholar than as a philosopher. In 1802 he went to London, where he was from 1803 to 1806 editor of the 'Literary Journal,' and then began the 'History of India,' which occupied him ten years. During this time he wrote much for periodicals and came to know Bentham personally; at the same time he was busied with the painstaking education of his children, notably John Stuart Mill (q.v.). The 'History of India,' a wonderfully scholarly and unpartisan work, marred only by his lack of personal knowledge of country and people and a consequent theorizing at times, was published in 1818 and immediately won for him a place in the India Office and relief from his long battle with penury. This position was the more flattering a tribute since he was now well known as a radical and a skeptic. He rose rapidly, becoming head of the Office in 1830. The 'Westminster Review' founded in 1824 as the organ of Bentham's followers contained many contributions by Mill; and several appeared in the 'London Review.' Both in ethics, where his position was strongly utilitarian, and in political economy, where he may still be reckoned as typical of the orthodox school so bitterly attacked by Ruskin, Mill is little more than a follower of Bentham, with greater force, perhaps, because of his comparatively larger knowledge of the world. In psychology, however, although largely a follower of Hartley, his work is more important, for he developed and gave to Hartley's principle of association a wider application, and thus was the founder of the school to which Spencer and Bain belong. Mill took part in politics and contributed largely to the success of the Reform Bill by introducing to England philosophical radicalism. His personal character was strangely unhuman and unlovable, though perfectly correct. His important works besides the 'History of India' are 'Elements of Political Economy,' the first great philosophic treatise on the subject (1821), and 'Analysis of the Phenomena of the Human Mind' (1829). Consult: Bain's biography (1882) and J. S. Mill's 'Autobiography' (1867).

Mill, John Stuart, English social and political reformer, philosopher, economist: b. London 20 May 1806; d. Avignon 3 May 1873. Few have combined so intimately a vital enthusiasm for human progress, with a keenly

critical and most scholarly temper. He presents in all his most important lines of work the interesting conflict which results when a candid, open mind, instinct with human interest, attempts to work with narrow conceptions and an inadequate method. The conceptions and method have in many respects been superseded, but the candor and sincerity, the scholarly, investigative temper, the deep interest in all things human, the democratic sympathy which manifest themselves in his works, give them permanent value.

Mill was the oldest son of James and Harriet (Burrow) Mill. His early education, conducted by his father, was extraordinary. He began Greek when about three years old, and Latin at seven, and read a great amount in both languages, especially in Greek, before he was twelve. He studied algebra, geometry and the differential calculus also in this period. History he read of his own accord and found amusement in books on natural science. At twelve Aristotle's 'Logic' began a more advanced course of instruction which included the more difficult classical authors, and ended, so far as his father's personal instruction was concerned, in his 14th year with a thorough study of Ricardo's 'Political Economy.' Mill himself says that it "was not an education of cram." "Anything which could be found out by thinking I never was told, until I had exhausted my efforts to find it out for myself." At the same time he declares that it "was in itself much more fitted for training me to know than to do." After a year in France, which had an important influence, the reading of Bentham made an epoch in his life. "I now had opinions; a creed, a doctrine, a philosophy; in one among the best senses of the word, a religion; the inculcation and diffusion of which could be made the principal outward purpose of a life." In the winter of 1822-3 he planned a society to which he gave the name of "Utilitarian," and thus brought the term into common use. In May 1823 he received an appointment from the East India Company as clerk in the office of the Examiner of India Correspondence. Here he remained 35 years, rising to be Examiner two years before the transfer of India to the British government in 1858, when he retired upon a pension of £1,500. He became a frequent contributor to the *Westminster Review* founded in 1823 as a Radical organ, and in 1834 became editor of a new Radical Review, the *London Review* (afterwards the *London and Westminster*). He was one of an ardent party of "philosophic radicals"; his object in life "to be a reformer of the world." Bentham, Malthus and Ricardo were influential upon the group. But several new influences now began to unsettle his political and social views. Coleridge, especially through Maurice and Mill's intimate friend Sterling, Carlyle, Goethe, Wordsworth, and the St. Simonians, gave broader views of human interests, and greater importance to feeling and sentiment than James Mill and Bentham. In Mill's own judgment, however, the most important influence, especially in leading "him to apply his abstract principles to the actual state of society and estimate their bearing upon human interests and sympathies more clearly and widely than he would otherwise have done,"

was that of Mrs. Taylor, to whom he was first introduced in 1830. He maintained with her for 20 years a friendship of increasing intimacy, and after the death of her husband married her in 1851. Mill loved his wife tenderly and spoke of her, notably in the 'Autobiography,' and in the dedication of the volume 'On Liberty' which was a joint production, in terms which seemed extravagant to his friends. A third period of Mill's mental progress fell at about the time between the first and third editions of his 'Political Economy' (1848-52). In the earlier period, he writes in his 'Autobiography,' "I was a Democrat, but not the least of a Socialist. We were now much less democrats than I had been, because so long as education continues to be so wretchedly imperfect, we dreaded the ignorance and especially the selfishness and brutality of the mass; but our ideal of ultimate improvement went far beyond Democracy, and would class us decidedly under the general designation of Socialists." In 1858 his wife died of congestion of the lungs in Avignon. When the civil war in America broke out he contributed a strong article on the side of the North. In 1865 he was elected a member of Parliament from Westminster, and took an active part in support of various reform measures, but was defeated for reelection in 1868. His later years were spent in literary labors until his death, which occurred at Avignon. He had then come to be generally regarded as the foremost living philosopher and economist of England.

Mill's published works are the following: 'System of Logic' (1843); 'Essays on some unsettled questions of Political Economy' (1844); 'Principles of Political Economy' (1848); 'Memorandum of the Improvements in the Administration of India' (1853); 'On Liberty' (1859); 'Thoughts on Parliamentary Reform' (1859); 'Dissertations and Discussions' (1859-75); 'Considerations on Representative Government' (1861); 'Utilitarianism' (1863); 'Examination of Sir William Hamilton's Philosophy' (1865); 'Auguste Comte and Positivism' (1865); 'England and Ireland' (1868); 'Subjection of Women' (1869); 'Autobiography' (1873); 'Nature, the Utility of Religion and Theism' (1874). In addition may be mentioned his edition, with notes, of James Mill's 'Analysis of the Phenomena of the Human Mind' (1869); his 'Inaugural Address delivered to the University of St. Andrew's,' (1 Feb. 1867); 'Speech in Favor of Women's Suffrage' 12 Jan. 1871 (1873); 'Speech on the Admission of Women to the Electoral Franchise,' 20 May 1867 (1867); H. D. Pym's 'Memories of Old Friends,' which contains 14 letters from J. S. Mill (1882); several articles in the *Westminster Review* and the *London and Westminster Review*, not reprinted in the 'Dissertations and Discussions.'

The keynote to Mill's method is found in the individualism which he inherited from the 18th century. This meant associationalism in logic and psychology, a metaphysical conception of reality as made up of separate phenomena, an ethical theory that made pleasure and pain the motives of action, *laissez faire* in political economy, and the political doctrine that the end of government is to protect each individual in the possession of the produce of his labor.

But in all these various fields he passed the bounds set by his inheritance. He was more concerned to find truth than to maintain a creed.

As *Logician*, Mill's greatest contribution was his treatment of induction. The four "methods" of agreement, difference, residues and concomitant variation had been mentioned by J. Herschel, but were by Mill first brought out clearly. In the part of his 'Logic' which deals with the nature and conditions of knowledge he attempts, with only partial success, to give logic a more vital relation to truth and fact than it had borne since Hobbes and Locke. He insists that propositions concern "things" not "ideas"; that there are "real kinds," not merely class names; that cause is not to be defined with Hume as "invariable antecedent" but as "unconditional antecedent" or "sum of conditions." But he does not see that this really implies a reconstructed view of nature, in which a conception of an interrelated system or whole should replace the conception of a mere sum of individuals or particulars. He remains true to his older presuppositions in holding that reasoning is from particular to particular, and that axioms owe their force to association. Matter, he holds, following Berkeley, is only permanent possibilities of sensation. In his view of the self, on the one hand, he considers that we can know only states of consciousness, that the law of association is the "governing principle," and that the conceptions by which knowledge is organized "are impressed upon the mind from without"; on the other hand he recognizes "the paradox, that something which, *ex hypothesi*, is but a series of feelings, can be aware of itself as a series." He therefore admits that "the mind, or ego, is something different from any series of feelings or possibilities of them." While, then, he holds to the doctrine of "circumstances" as determining character, he is careful to insist that this is not "necessity" in the ordinary sense; "our own desires can do much to shape those circumstances."

As *Economist*, Mill attempted to follow the general plan of Adam Smith and give the science a more concrete form than it had received at the hands of Ricardo; to treat it not merely as an abstract science of the "economic man," but as "branch of social philosophy, so interlinked with all the other branches that its conclusions are only true conditionally." The current economists had aroused the antagonism of the working classes. Malthusianism held out a grim prospect of increasing stress with increase of population. Ricardo's presentation of the laws of wages seemed to condemn as absolutely futile all effort to raise wages, whether by voluntary association or by political action. The repeal of the corn laws would, it was feared, ultimately benefit the employers instead of the employed. Mill retained the Malthusian doctrine as one of his cornerstones. He sees hope for the laboring classes only if they will restrict their offspring and thus diminish the supply of labor. He retains also the doctrine that labor is supported by capital, and in his 'Political Economy' speaks of a "wage fund." But as an ardent sympathizer with the working class Mill makes various concessions and suggestions which made his work far less a "diurnal sci-

ence." 'Political Economy' "has no pretension to the character of a practical guide, apart from other classes of consideration." While the laws of the production of wealth are "real laws of nature," the modes of its distribution, "subject to certain conditions, depend on human will." The "existing arrangements of society" have much to do with determining what shares fall to laborers, capitalists and landlords, and these arrangements may be altered "by the progress of social improvement." At first he thought only of getting rid of primogeniture and entails, and of promoting restraint of population by general education. He later came to look for a great advance in coöperation, and in the character which this implies. In 1869 he definitely retracted the "wage-fund doctrine, recognizing that there is a considerable range in the wage which economic conditions allow and hence that trades-unions may raise wages to a certain extent." In his last years he was especially impressed with the injustice of the places which the land owners occupy at "Malthus's feast." "Land alone has the privilege of steadily rising in value from natural causes." The "unearned increment" should be not for the private owner but for the nation. He differed from more complete Socialists in retaining competition in his scheme, and insisting that the associations for coöperation must be voluntary. He regarded the problem of the future to be "how to unite the greatest individual liberty of action, with a common ownership in the raw material of the globe, and an equal participation of all in the benefits of combined labor."

His moral and political theories are set forth in his 'Utilitarianism,' 'Liberty,' and 'Subjection of Women.' He always remained a Utilitarian in the sense that he believed "those actions right which promote the greatest happiness of the greatest number"; further, he attempted to prove this by the individualistic doctrine that since each one desires his own happiness, the general happiness must be a good, not noticing the possible conflict between such happiness-seeking in individuals, which would make a "sum" impossible. But elsewhere he breaks away decisively from Bentham's doctrine that happiness means only pleasure of varying intensity, length, certainty, etc., regardless of what objects produce it. "Higher pleasure," a "sense of dignity," will not be exchanged for any amount of the "lower" by the expert judge. It is "better to be Socrates dissatisfied than a pig satisfied." This is evidently abandoning pleasure pure and simple as standard, and setting up instead a "standard for pleasure," namely, the character of the man who judges. In the 'Liberty' he states that the utility which is the ultimate appeal "must be utility in the largest sense, grounded on the permanent interests of man as a progressive being." The motives on which he relies are not the external "sanctions" of Bentham; nor yet the association of private with public happiness which James Mill had regarded as the structure of conscience. These suddenly appeared to him artificial. Partly under the influence of Comte he came to hold, rather, that conscientious regard for others is supported by natural social instincts. His 'Liberty,' the most carefully written of his works,

contains a fresh and vigorous argument for the principle that only self-protection—to prevent harm to others—justifies society in interfering with the individual's liberty of action. "His own good is not a sufficient warrant." The positive reason for this is the great value of individuality in human welfare. The principle requires not only liberty from legal restraint, but from the coercion of public opinion. It comprises, first, liberty of thought and discussion, in order that truth may be reached; secondly, liberty of tastes and pursuits; thirdly, freedom to unite for any purpose, not involving harm to others. In the 'Subjection of Women' he argues for the complete legal equality of men and women, not only to remove injustice but because "the only school of genuine moral sentiment is society between equals." "We have had the morality of submission, and the morality of chivalry and generosity; the time is now come for the morality of justice." Moreover, a position of equality with its accompanying effects of enlarged interests, wider responsibility, greater dignity, and the possibility of individual development and satisfactions would add immeasurably to the well being of all other members of the family.

Mill's religious views are found chiefly in the 'Examination of Sir William Hamilton' and in the three essays published after his death. He found no warrant for making nature a standard of morals or for inferring from it perfect benevolence or justice. Indeed only by sacrificing the attribute of omnipotence can we reconcile nature with the existence of a moral deity. In all this he is considering the older deistic conceptions, nature, man, and God, as three separate beings. But there is much in his thought which is incompatible with such mechanical separation of nature and spirit, and of human and divine, notably in the famous passage from the 'Examination.' In reply to Dean Mansel's mode of reconciling supposed divine action with human conceptions of justice by the doctrine that God is Inconceivable, and therefore what is wrong by human standards may be right by divine standards, Mill replies, "I will call no being good, who is not what I mean when I apply that epithet to my fellow creatures; and if such a being can sentence me to hell for not so calling him, to hell I will go."

Bibliography.—W. L. Courtney, 'Life of J. S. Mill' contains full bibliography; A. Bain, 'J. S. Mill, A Criticism, with personal recollections'; Charles Douglas, 'J. S. Mill, A Study of his Philosophy'; same author, 'The Ethics of J. S. Mill'; W. L. Courtney, 'The Metaphysics of J. S. Mill'; Leslie Stephen, 'The Utilitarians' (Vol. III is devoted chiefly to review of Mill's work); Höffding, 'History of Modern Philosophy', Vol. II.; T. H. Green, 'The Logic of J. S. Mill' in 'Works', Vol. II.; John Grote, 'An Examination of the Utilitarian Philosophy'; W. Graham, 'English Political Philosophy'; John Morley, 'Critical Miscellanies' (Second Series); Recent Economists, for example, Marshall and Sidgwick, discuss Mill's economic theories.

JAMES H. TUFTS,

Professor of Philosophy, University of Chicago.

MILL, the general name of a machine for grinding, crushing, or pulverizing. Also a lapi-

dary's grinding wheel, known as roughing mill. Also a machine, or complication of engines or machinery, for working up raw material; as, a cotton mill, a spinning mill, a saw mill, an oil mill, etc. In die-sinking, the hardened steel roller having the design in cameo, and used for impressing in intaglio a plate, as in the bank-note system of engraving; or a copper cylinder, as in the process of engraving cylinders for calico printing.

Mill Springs, Ky., village in Wayne County; on the Cumberland River; about 90 miles south of Frankfort. It has steamer connections with places on the Cumberland and Ohio rivers. A battle was fought here on 19 Jan. 1862, between the Federal and Confederate forces. (See **MILL SPRINGS, BATTLE OF**.) A National cemetery located here contains 718 graves of soldiers.

Mill Springs, Battle of. The opening of the Kentucky-Tennessee campaign of 1862. At the close of 1861 the Confederate line extended from Columbus, Ky., on the Mississippi, through Fort Henry on the Tennessee, Fort Donelson on the Cumberland, Clarksville, Tenn., and Bowling Green, Ky., to Mill Springs on the Cumberland. Gen. A. S. Johnston was in chief command. Gen. D. C. Buell was the opposing Union commander. Gen. F. K. Zollicoffer established the Confederate right at Mill Springs early in December. Gen. Geo. B. Crittenden took general command there at the middle of the month, with the brigades of Zollicoffer and W. H. Carroll under him. Gen. Leonidas Polk held the Confederate left at Columbus, Gen. J. B. Floyd reached Fort Donelson 13 February, and had under him Gens. Pillow, Buckner, and Bushrod Johnson. Gen. A. S. Johnston was at Bowling Green, the centre. Gen. Geo. H. Thomas was on the Union left, with Gen. Schoepf immediately opposed to Zollicoffer, while Gen. Buell, with headquarters at Louisville, was in close communication with the Union centre, which threatened Bowling Green and Nashville.

Gen. Zollicoffer, having crossed from Mill Springs to the north bank of the Cumberland and intrenched his position, from which he threatened central Kentucky, Gen. Thomas was sent against his forces, now commanded by Gen. Crittenden, from the direction of Lebanon. On 18 January Gen. Thomas reached Logan's Cross Roads about 10 miles from Crittenden's intrenchments. The latter officer, with the purpose of attacking before Thomas could concentrate his forces, marched at midnight of the 18th with Zollicoffer's and Carroll's brigades, consisting of eight regiments of infantry, six guns, and four battalions of cavalry, and attacked Gen. Thomas soon after daylight of 19 January.

The Union troops, consisting of six infantry regiments, one battery, and a portion of a cavalry regiment, were brought rapidly into action, both sides fighting with spirit. Finally, when three fresh Union regiments fell on the Confederate right, and the 2d Minnesota was pouring a galling fire upon the centre, the 9th Ohio (German Turners) made a brilliant bayonet charge completely turning the Confederate left, resulting in the Confederate lines breaking and retiring in confusion. At this point Gen. Schoepf's brigade from Somerset reached the field, and the whole force continued in pursuit, reaching

the Confederate intrenchments during the night, and forming to assault them at daylight. During the night the Confederates succeeded in crossing their men, leaving artillery, cavalry, horses, mules, wagons, camp equipage and private baggage. The Confederate right wing was effectually broken and largely dispersed.

The overthrow of the Confederate right was followed 6 February by the capture by Admiral Foote, acting in co-operation with Gen. Grant, of Fort Henry on the Tennessee, and 16 February by the capture of Fort Donelson, with its artillery and garrison of about 15,000, by Gen. Grant.

On 8 February Gen. Johnston notified the Secretary of War that the loss of Fort Henry and the movement against Fort Donelson made the Bowling Green line untenable, and that he had directed Gen. Hardee at Bowling Green to prepare to fall back on Nashville. The evacuation was completed 14 February, and by the 17th Gen. Hardee had crossed the Cumberland at Nashville and proceeded toward Murfreesboro. Ten days later, all army supplies having been sent to Chattanooga, which place was held by troops sent by Gen. Bragg from Mobile, Johnston's army marched for the line of the Memphis & Charleston Railroad at Decatur, this line having been decided upon as the next for defense.

By the last of March Johnston's column had taken position at Corinth, Bragg's forces had reached him from Mobile, and a portion of Polk's from Columbus.

Meantime (15 February) Bowling Green was occupied by Union forces under O. M. Mitchell. Pressing on, he reached Edgefield opposite Nashville on the 14th. Nelson's division arrived by transports the next day, and soon after the first of March Buell's entire column, coming partly by land and in part by river, was concentrated at Nashville.

The Union movement to Pittsburg Landing began 10 March by the despatch of Gen. W. T. Sherman's division from Paducah up the Tennessee. It proceeded, under orders of Gen. C. F. Smith, to the vicinity of Eastport; but finding all streams inland at flood, the expedition dropped back to Pittsburg Landing, where it found Hurlbut's division. The latter took post $1\frac{1}{2}$ miles back 18 February, and Sherman's the next day about three miles back, at Shiloh Church. These were followed within a few days by the divisions of Prentiss, McClelland and W. H. H. Wallace, each selecting its own camp without special reference to a general line, the movement being regarded as a concentration preparatory to an advance on Corinth. Gen. Lew Wallace's division was halted at Crump's Landing, five miles below Pittsburg. Gen. Grant arrived and assumed command 17 March, establishing his headquarters at Savannah nine miles below, on the opposite side of the Tennessee.

Gen. Buell's advance left Nashville 15 March to join Gen. Grant at Savannah. After marching 130 miles in nine days he was stopped by high water in Duck River, necessitating bridging, and then marched the remaining 90 miles in six days. Gen. Grant had advised him that it was not necessary to hurry, as he would not be ready to cross his command over the river till 8 April. However, Buell pushed on and fortunately reached Savannah with the head of his column the night of the 5th. Gen. Johnston, with the

design of attacking Grant before Buell could join him, had marched from Corinth 3d April, with the expectation of attacking on the 5th, but heavy rains delayed his columns, and his unexpected attack was delivered soon after daylight of 6 April, thus opening the battle of Shiloh or Pittsburg Landing. See SHILOH, BATTLE OF.

H. V. BOYNTON.

Millais, mil-lä', Sir John Everett, English painter: b. Southampton, England, 8 June 1829; d. London 13 Aug. 1896. His earliest years were spent in Jersey and at Dinan in France, and at the age of eight, he was sent to study art under Mr. Sass. In 1840 he became a student in the Royal Academy, and in 1846 he exhibited his 'Pizarro seizing the Inca of Peru.' Next year the gold medal of the Academy was awarded to his 'Young Men of Benjamin seizing their Brides.' In 1848, along with Holman Hunt, Dante G. Rossetti, and others, he founded the Pre-Raphaelite Brotherhood. Among the chief works of this period are 'A Huguenot,' 'The Order of Release,' and the 'Proscribed Royalist.' In 1853 he was elected an associate of the Royal Academy, and ten years later Academician. For a few years thereafter his pictures were still influenced by the Pre-Raphaelite principles, which he gradually shook himself clear of. He developed into a splendid colorist, a master of technique, and altogether a great modern master. Numerous honors fell to him; he was decorated with the Legion of Honor in 1878, elected a member of the Académie des Beaux-Arts in 1882, created a baronet in 1885, and elected to succeed Lord Leighton as President of the Royal Academy in 1896; but he only held this last position about six months, dying on 13 August of the same year. He was most successful in figure-pieces and portraits, but he also produced a certain number of landscapes, one of the finest being 'Chill October' (1871). He painted portraits of some of the foremost men of the day, including Mr. Gladstone, Lord Beaconsfield, Lord Salisbury, Mr. Ruskin, Lord Tennyson, and others.

Millard, mil'ard, Evelyn, English actress: b. London. After a private education, she made her first appearance in 1891 in a stock company at Margate. Among her parts are Polly Fletcher in 'The Lost Paradise'; Princess Flavia in 'The Prisoner of Zenda'; Portia in Beerbohm Tree's production of 'Julius Caesar' in 1898; and Miss Hobbs in J. K. Jerome's comedy of that name.

Millbank Prison, or The Penitentiary, a famous London house of detention, demolished in 1891. It was situated in the parish of St. John's, Westminster, facing the Thames, and was erected at an enormous cost to carry out the plans of the philanthropists Howard and Bentham. The building was commenced in 1812, and completed in 1821. It had accommodation for 1,100 prisoners. The prison ceased to be a convict establishment in May 1886.

Millboard, in bookbinding, a pasteboard made of strong materials, used for the stiff portion of book covers. It is also used for packing between the flanges of pipes, being previously soaked in oil.

Millbury, mil'bū-ri, Mass., town in Worcester County: on the Blackstone River, and on the Boston & A. and the New York, N. H. & H. R.R.'s; about five miles southeast of Worcester.

MILLEDGE—MILLENNIUM

It was settled in 1743 and was called North Parish of Sutton until 1813 when it was incorporated. It is claimed as the place where the "Lyceum Lecture System" originated in 1820. It is a manufacturing town; the chief industrial establishments are foundries, machine-shops, linen cloth factory, woolen mills, thread factories, hosiery mills, lumber mills, weaving machinery, and cotton mills. Pop. (1890) 4,428; (1900) 4,460, (1910) 4,740.

Milledge, mil'ej, John, American soldier and politician: b. Savannah, Ga., 1757, d. 9 Feb. 1818. At the outbreak of the Revolution he was one of the party which, led by Joseph Habersham, made a prisoner of Wright, the royal governor, 17 June 1775, the first bold revolutionary act performed in Georgia. When Savannah was taken by the British, Milledge escaped to South Carolina, where he was captured by a party of Americans, and came near being hanged as a spy. In 1779 he was present at the unsuccessful siege of Savannah. He was also at the siege of Augusta, and in South Carolina and Georgia, at various places, did valuable service in the patriot army. In 1780 he was appointed attorney-general of Georgia, and afterward served frequently in the State legislature. In 1802 he was elected governor of Georgia, and served two terms. He was a representative in Congress from 1792 to 1802, except one term, and United States senator from 1806 to 1809. Milledge was the principal founder of the University of Georgia, and purchased and presented a tract of land which is the site of the university and of a part of Athens, its seat. See **MILLEDGEVILLE**.

Milledgeville, mil'ej-vil, Ga., city, county-seat of Baldwin County; on the Oconee River, and on the Georgia and the Central of G. R.R.'s; about 30 miles northeast of Macon. It is near the geographical centre of the State; and streams nearby furnish natural drainage and water-power. The dam on the Oconee increases the water-power. The place was settled in 1803, received its city charter in 1836, and was named in honor of John Milledge (q.v.). From 1807 to 1867 it was the capital of the State. It is in a fertile agricultural region in which cotton, corn, wheat, hay, and fruits are the chief products. In the vicinity are fine deposits of talc, kaolin, and fire-clay. Ornamental and building brick are manufactured extensively and quantities of clay are shipped to other places. The preparation of cotton for the markets is a most important industry. The building which was once the State capitol is now the Georgia Military College, a school which, in 1903, had in attendance 500 students. Other institutions are the Georgia Normal and Industrial College, a State School for Girls, and the State Sanitarium for the Insane. The State Prison farm is just outside the city limits. The government is administered under a charter of 1900 and is vested in a mayor who holds office two years, and a council. The mayor is a member of the council. Pop. (1910) 4,385.

Millenarians. See **MILLENNIUM**.

Millenary Petition, in English history, a petition named from the number of signatures appended to it presented by the Puritans to James I., in 1603. The petitioners desired to be relieved from the use of the sign of the cross in baptism, the ring in the marriage service, con-

firmation, and bowing at the name of Jesus. The petition in reality contained only 750 names, instead of 1,000.

Millennium (Lat. *mille*, 1,000, and *annus*, a year), a period of 1,000 years. Hence it is a term applied to the period during which, according to some, Jesus Christ will return to reign on earth before the end of the world. This pre-millennial appearance of Christ will be signalized by a first or particular resurrection of the just, who are to reign with Him on earth, and by the destruction of Antichrist. Those who hold such views are called millenarians or chiliasts, and their tenet chiliasm (Gr. *χίλιαι*, 1,000). It is admitted on all sides that these views were, if not general, at least very common in the ancient church. The belief was generally founded on Pa. xc. 4, according to which 1,000 years are before the Lord as one day, compared with the account of the creation as given by Moses. The six days of creation are taken as designating 6,000 years of toil, and the subsequent sabbath as designating 1,000 years of rest and happiness. The millennium was to be the sabbath rest of the new creation of mankind in Christ. Besides these passages, Rev. xxi. 1-6 is especially quoted by chiliasts in support of their views. Chiliasm prevailed chiefly among the Jewish Christians, who retained after their conversion the hope that they would rule over all other nations under a royal Messiah (q.v.). The Ebionites, the Nazarenes, and Cerinthians all advocated it; and Montanus, and the sect which was called after him, regarded it as a fundamental doctrine of the Christian religion. Some early fathers of the church also declared themselves generally in favor of the doctrine; Papias, Irenaeus, and Tertullian were chiliasts; and Papias appealed in support of his view to apostolic traditions. On the other hand, however, the epistles of Clement of Rome and Ignatius of Antioch, are silent about it. Justin Martyr who wrote in the second century was a believer in the millennium. "I and all Christians whose belief is in every respect correct," he says, "know that there will be both a resurrection of the flesh and a thousand years in Jerusalem, which will then be rebuilt, adorned and enlarged, as the prophets Ezekiel, Isaiah and others declare." This view was opposed by the whole Alexandrian school, especially by Origen, who believed in a spiritual supramundane interpretation of Revelations. Still it continued to find advocates during the 3d century, among whom Tertullian, Nepos, bishop of Arsinoe, and Methodius, bishop of Tyre, were prominent. In the 4th century, Jerome, who did not believe in it himself, did not dare to condemn it, in consideration of the many pious and learned advocates it had found in former centuries. Soon after it began to die out; it was temporarily revived toward the close of the 10th century, by the popular belief in the approaching end of the world, but it never regained great strength. The reformation of the 16th century gave a new impulse to chiliasm. Fanatical opinion identified the pope with Antichrist, and regarded the anticipated downfall of the Roman Catholic Church as foreshadowing the approach of the millennium. But when the Anabaptists undertook in 1534 to erect the new Zion, both the Lutheran and Reformed churches declared themselves against this reversion of the old doctrine. Yet it was preached by many

sectarians and theologians of the 16th and 17th centuries, among whom were Weigel and the Moravian bishop Comenius in Germany, Jurieu in France, the Labadists in the Netherlands, and Joseph Mede and Jane Lead (died 1704) in England. A third period in the history of chiliasm may be commenced with the writings of the esteemed exegete and New Testament commentator, Johann Albrecht Bengel. He practically reintroduced it into Protestant theology, where it has ever since been advocated by a number of prominent theologians. The ingenious prelate Oetinger (d. 1783) brought it into connection with his favorite theosophic views. Hahn (the founder of a pietistic sect in Württemberg), Stilling, Lavater, and Hass gave it a wide circulation among the lower classes of the people in Germany and Switzerland. In opposition to the "spiritualism" of modern exegesis, it was advocated, with exegetical arguments, by Hoffmann, Delitzsch, Kurtz, Hebart, and others; while Thiersch, Nitzsch, P. Lange, and Ebrard supported it from a dogmatical as well as an exegetical standpoint. Swedenborg taught that the last judgment took place in 1757, and that the New Church or church of the New Jerusalem had actually been formed both in heaven and on earth. After Germany, England and America have been the chief fields of modern chiliasm. The "Catholic Apostolic Church," organized by Edward Irving, laid great stress on the belief that the kingdom of glory was very near. Chiliasm lies at the foundation of Mormonism, whose adherents call themselves "Latter Day Saints" in reference to the near approach of the last day. In the United States great excitement was caused by the preaching of William Miller (q.v.), who sought to prove from the Scriptures that the second advent of Christ would take place about 1843. He not only met with numerous chiliasmists in most denominations, but he also founded the sect of Adventists (q.v.). Chiliasm has been seriously taken in declarations of doctrine formulated by several churches. The Augsburg Confession implicitly repudiates it, speaking of "the last days foreshown in Holy Scripture, in which the world is to become ever more and more degenerate and mankind more sinful and weak." The Council of Trent declares that "the Scriptures also inform us that the General Judgment shall be preceded by the preaching of the Gospel throughout the world, a defection from the faith and the coming of Antichrist." There is a sort of millennium also looked forward to by those who disbelieve in religion as the renovator of the world. According to these teachers there is a material millennium quite within the range of future possibilities. They teach that the race must look to its renewal and improvement by the non-propagation of disease and impotency of every nature, and to the persistent and joyous multiplication of the best elements of our race, in a continual progress toward the Hierarchy of Life. The millennium, according to this newly invented philosophy, will come by natural and not supernatural means.

Consult: Luthardt, 'Lehre von den letzten Dingen' (1870); Seiss, 'The Last Times' (1878); Salmond, 'Christian Doctrine of Immortality' (1897); Terry, 'Biblical Apocalypses' (1898). See ECHATOLOGY; JUDGMENT, FINAL; RESURRECTION.

Millepede, a myriapod of the *Chilognatha*, the second order of the class *Myriapoda*, in

which each segment of the body, except a few of the front joints, bears two pairs of legs—the joints in the nearly-related centipedes (q.v.) bearing each one pair only. The common species (genus *Julus*) are found in damp places, concealed under stones, or under the bark of trees. The body consists of from forty to fifty joints, protected by a horny skin, and when irritated or at rest, these animals coil up for protection. The mouth is provided with a pair of strong jaws or "mandibles"; and the antennae or feelers consist of six or seven joints. See MYRIAPODA.

Millepore, family (*Milleporidae*) of *Hydroses*, remarkable for secreting massive calcareous skeletons like corals, with which they were for a long time classed. The hydranths are of two kinds gastrozooids, or feeding polyps, which provide nourishment for the colony, and dactylozooids, which are elongated, mouthless, protective polyps provided with large numbers of nematocysts (q.v.). The generative cells are remarkable for their wanderings through the tissues of the polyps and colonies. The colonies are hermaphrodite, but the related family *Stylasteridae* has unisexual colonies. They live in warm seas and form reefs in shallow waters. *Millepora albicornis* is abundant near low water in the West Indies, where representatives of the *Stylasteridae* also occur in deep water.

Miller, Alfred Branshear, American Presbyterian clergyman and educator: b. Brownsville, Pa., 16 Oct. 1829; d. Waynesburg, Pa., 20 Jan. 1902. After obtaining his preparatory education in various schools, he graduated from Waynesburg College in 1853, becoming professor of mathematics there, and remaining in that position until 1858. In 1859 he became president of the college and served as such till 1899 when he became president emeritus. He was for 10 years pastor of the Cumberland Presbyterian church at Waynesburg and also edited the 'Cumberland Presbyterian' (1864-8). He published 'Doctrines and Genius of the Cumberland Presbyterian Church' (1892).

Miller, Anna Jenness, American author and lecturer: b. New Hampshire. She is most widely known as an advocate of correct principles of physical development and dress for women; she is also interested in the æsthetic side of life, and is a student of art and a collector of paintings and curios. She was for many years editor and proprietor of the 'Jenness Miller Monthly,' in which she advocated her views; and has given over 1,000 lectures in the United States and Canada on physical culture and dress. She has also designed a costume for women which she claims fulfils the requirements of both hygiene and art. She has published 'Barbara Thayer' (1884); 'Twixt Love and Law'; 'Mother and Babe' (1892); 'How to Finish and Furnish a Home' (1892); 'Creating a Home' (1896); 'Physical Beauty'; and 'Philosopher of Driftwood.'

Miller, Alfred Jacob, American painter: b. Baltimore, Md., 1810; d. 1874. He studied under Thomas Sully, and in Europe, where he made successful copies of the old masters. Accompanying Sir William Drummond Stewart to the Rocky Mountains, he painted many striking pictures of the scenery, which are now in Murthley Castle, Scotland. He also executed numerous portraits.

MILLER

Miller, Charles Henry, American landscape painter: b. New York 20 March 1842. He was educated in medicine at the New York Homoeopathic College and subsequently studied art at the Royal Academy of Bavaria in Munich. In 1873 he became an associate of the National Academy of Design and an Academician in 1875. He is especially noted for his studies of Long Island scenery and has exhibited at very many important national and international exhibitions. Among his works may be cited 'Autumn at Creedmoor Oaks'; 'A Grey Day on Long Island'; 'Moonlight near Great South Bay'; 'Long Island Meadows'; 'A Frosty Day on Long Island'; 'The Springfield Mill Pond.' He has published under the signature of 'Carl de Muldor,' 'The Philosophy of Art in America' (1885).

Miller, Charles Ransom, American journalist: b. Hanover, N. H., 17 Jan. 1849. He was graduated from Dartmouth College in 1872 and became a journalist. In 1872-5 he was with the *Springfield Republican* and since then has been on the staff of the *New York Times*, where he was editorial writer in 1881-3 and is now editor-in-chief.

Miller, Cincinnatus Heine, better known as "JOAQUIN MILLER," American poet, whose pseudonym is due to his defense of Joaquin Murietta, a Mexican bandit: b. Wabash district, Ind., 10 Nov. 1841. His father took him to Oregon in 1854. He got a little schooling but soon ran away from home; went to the California gold mines; accompanied Walker on the Nicaragua filibustering expedition; lived familiarly among the Indians and the Spaniards of the Pacific slope; studied law for a few years, having graduated at Columbia College, Oregon, in 1858; practised law unsuccessfully in Idaho, where he soon turned express messenger, and in 1863 settled in Oregon for a short time, becoming editor of the *Eugene City Democratic Register*, which was suppressed in the same year because of its treasonable character. In 1864 he began to practise law in Cañon City, Ore., made himself popular by his services against the warlike Snake Indians, and from 1866 to 1870 was judge of Grant County. His writings collected under the title 'Songs of the Sierras' he could not sell in the East, and so took them to London, where they were published and brought him great fame. He visited London again in 1873; lived in Washington, D. C.; and in 1887 returned to California, settling near Oakland. His life sums up the adventure of the Pacific slope, and his verse and fiction are to be prized especially on this account as being real "documents" of certain phases of American life. They are, moreover, fresh, vigorous, and original in style; his metre is free and powerful; and his narrative forcible. He excels, perhaps, in his pictures of Nature. In a few short lyrics there is a quiet melancholy, bred of communion with solitary wood and mountain. But on the whole he is not a great artist, although his work has a distinct value as descriptive of various American types. Hence his fame has been much greater in England, where he was even styled 'the American Byron,' than in America. Miller's verse includes: 'Songs of the Sunlands' (1873); 'Songs of the Desert' (1875); 'Songs of Italy' (1878); 'Collected Poems' (1882); and 'Songs of Mexican Seas' (1887). His

prose works are: 'The Baroness of New York' (1877); 'The Danites in the Sierras' (1881; later in the form of a play); and '49, or the Gold-Seekers of the Sierras' (1884).

Miller, Emily Huntington, American author and educator: b. Brooklyn, Conn., 22 Oct. 1833. She was graduated from Oberlin College, Ohio, in 1857, and was married to J. E. Miller (d. 1882) in 1860. She was editor of a juvenile magazine, 'The Little Corporal,' afterward merged in 'St. Nicholas,' and in 1891-8 was dean of the Woman's College of Northwestern University. She has written: 'From Avalon and Other Poems' (1896); 'Fighting the Enemy'; 'Helps and Hindrances'; 'Songs from the Just'; etc.

Miller, Florence Fenwick, English doctor, lecturer and author: b. 5 Nov. 1854. She entered the Ladies' Medical College, London, in 1871; gained a wide practice and did much charity work; was thrice a member of the London school board; and is a prominent advocate of women's suffrage. She married Frederick A. Ford in 1877, but kept her maiden name. She wrote: 'The House of Life' (1879); 'Physiology for Schools' (1880); 'Atlas of Anatomy' (1880); 'Readings in Social Economy' (1883); 'Life of Harriet Martineau' (1884); and 'In Ladies' Company' (1892), as well as letters over the signature 'Filomena' for the *London News* and for various provincial papers.

Miller, Harriet Mann ("OLIVE THORNE MILLER"), American ornithological writer: b. Auburn, N. Y., 25 June 1831. Her earliest writings were signed 'Olive Thorne,' and after her marriage to W. T. Miller in 1849 she added her husband's name to her signature. She began her study of birds in 1880 and has published for young people's reading: 'Little Folks in Feathers and Fur' (1879); 'Little People of Asia' (1882); 'In Nesting Time' (1888); 'Little Brothers of the Air' (1892); 'A Bird-Lover in the West' (1894); 'Our Home Pets' (1894); 'Four Handed Folk' (1896); 'Under the Tree Tops' (1897); 'The First Book of Birds' (1899); etc.

Miller, Hugh, Scottish geologist and author: b. Cromarty 10 Oct. 1802; d. Portobello, near Edinburgh, 23 Dec. 1856. When five years old he lost his father, a seaman, and thus came under the care of his mother and her two brothers, who were unable to keep him in school, so fond was he of out-door life, of unrestrained reading, and of composition. That he might have the winter months free to write in, it is said, he became a stonemason. At this trade he worked from 1819 to 1834; gained some literary repute in the meantime, especially by letters to the 'Inverness Courier' on the herring fishery; in 1834 became accountant in the bank at Cromarty; wrote 'Scenes and Legends of the North of Scotland' (1836); and gradually became known for his knowledge of geology, to which he had first been drawn by noting the ripple marks on a block he was handling in the stonecutters' yard. 'Old Red Sandstone or New Walks in Old Fields' (1842) made Miller famous, and the Old Red Sandstone became freshly important to the geologist. Miller was a devout Christian, a promoter of the 'Free Church,' and intensely orthodox in his

MILLER

opinions. Hence he opposed the doctrine of development advanced in the anonymous 'Vestiges of Creation,' and in 1847 published 'Footprints of the Creator,' to which 'The Testimony of the Rocks' (1857) formed a sort of sequel. In these books Miller held that, while the Bible is not a scientific text-book and should not be so regarded, yet it is not contradicted by science. In particular he urged that the narrative of a six-day creation was entirely consonant with modern geological discovery; indeed he divided into six eras, to correspond with these six 'days,' all of geological history. His interest in the Free Church movement prompted him in 1839 to write 'A Letter to Lord Brougham' and 'The Whiggism of the Old School,' in which he protested against forcing clergy on the Scotch churches. Both pamphlets were so forceful that their author in 1840 was made editor of the 'Witness,' an Edinburgh bi-weekly devoted to ecclesiastical independence. This post he held for nearly 17 years, while his health gradually broke under the stonemason's disease contracted years before; at the same time his mind suddenly failed, and in a moment of aberration he shot himself. Miller's present vogue is due to his admirable, simple and fascinating style. As a scientist he did, it is true, urge the doctrine of specific creation, and emphasize the complete definiteness of demarcation between strata of various geological series and the catastrophic nature of the change from one era to another; but these views were not reactionary at the time, being held by other scientists with far wider and deeper training than Miller. His common sense and native sagacity led him to the correct solution of many minor concrete problems in geology; and his books popularized the study of that science. Consult: Miller's famous autobiography, 'My Schools and Schoolmasters' (1852); Bayne, 'Life and Letters of Hugh Miller' (1871); a memoir by Agassiz in the later American editions of 'Footprints of the Creator'; and Brown, 'Labour and Triumph' (1858).

Miller, James, American soldier and politician: b. Peterboro, N. H., 25 April 1776; d. Temple, N. H., 7 July 1851. He was educated for the bar, but entered the army as major in 1808, and distinguished himself on the northern frontier. In 1812 he was brevetted colonel for gallantry as commander at Brownstown, and in the following year participated with credit in the capture of Fort George. In 1814, as colonel of the 21st infantry, he accompanied the invading army into Canada, and fought with gallantry at the battles of Chippewa and Lundy's Lane (qq.v.), the success of the Americans in the latter conflict being mainly due to his capture of a British battery. For these services he was made brigadier-general, and received from Congress a gold medal. In 1819 he resigned his commission in the army, and from that year until 1825 served as governor of the Territory of Arkansas. He was collector of the port of Salem, Mass., from 1825 to 1849, when he retired to private life.

Miller, James Russell, American Presbyterian clergyman and author: b. Harshaville, Pa., 20 March 1840. He was graduated from Westminster College, New Wilmington, Pa., in 1866 and has held several important pastorates.

He is editor of the Presbyterian Board of Publication and among his very numerous books are: 'Week-Day Religion' (1880); 'The Marriage Altar' (1888); 'Building of Character' (1894); 'To-day and To-morrow' (1902); 'In Perfect Peace' (1902); etc.

Miller, Joaquin. See MILLER, CINCINNATUS HEINE.

Miller, John Franklin, American soldier: b. South Bend, Ind., 21 Nov. 1831; d. Washington, D. C., 8 March 1886. He was graduated from the New York State Law School in 1852 and established a practice at South Bend, and took a leading part in State politics. In 1860 he was elected State senator, but resigned to enter the army the next year. He was in active service from almost the beginning, and in the battle at Stone River he performed services which led to his promotion to the rank of brigadier-general. He resigned at the close of the war though offered a commission as colonel in the regular army, and removed to California, where he for a time practised law and then entered a business life. He continued an active interest in politics, and from 1881 until his death was United States Senator.

Miller, Joseph. See JOE MILLER.

Miller, Joseph Nelson, American naval officer: b. Ohio 22 Nov. 1836; d. Brick Church, N. J., 26 April 1909. He entered the navy in 1851, in 1861 had risen to the rank of lieutenant, and was promoted lieutenant commander in 1862. As executive officer of the Passaic he had part in the attack upon Fort McAllister and Fort Sumter, and in the two attacks upon Fort Fisher as executive officer of the Monadnock; and received commendation from his commanding officers for bravery and skill in these engagements. In 1870 he was promoted to the rank of commander, and in 1875 was assigned to the Tuscarora, and had charge of the deep sea soundings between the Hawaiian and the Fiji Islands. He obtained the rank of captain in 1881, commodore in 1894, and rear-admiral in 1897. In the latter year as commander-in-chief of the Pacific stations he hoisted the American flag at Honolulu, and in 1898 again raised the flag there, when American sovereignty of Hawaii was established. In 1897 he was the representative of the United States Navy at Queen Victoria's Jubilee, with the Brooklyn as flagship; and during the Spanish War (1898) he organized the naval reserves on the Pacific coast. He was retired from active service in November 1898.

Miller, Lewis, American inventor and philanthropist: b. Greentown, Ohio, 1829; d. New York 17 Feb. 1899. He was a machinist, settled at Canton, Ohio, where he made agricultural tools, many of them after his own designs, notably the first successful reapers and binders; and later had factories at Akron and Mansfield. In Akron he built a model Sunday School, and he gave much money for Sunday School work throughout the country. He planned the Chautauqua Assembly and was its president from 1874 until his death.

Miller, Merrill, American naval officer: b. Ohio. He was appointed to the United States Naval Academy in 1859 and upon the outbreak of the Civil War was assigned to active duty. He was in the Mississippi squad-

MILLER—MILLERAND

ron in 1866-3, was at the battles of Arkansas Post, Haines' Bluff, the siege of Vicksburg, and in 1864-5 was with the North Atlantic squadron. He continued in the navy after the war in different stations, was promoted captain in 1893, and since 1897 has been in command of United States receiving-ship Vermont.

Miller, Olive Thorne. See **MILLER, HARRIET (MANN).**

Miller, Patrick, Scottish pioneer in steam navigation: b. Glasgow 1731; d. Dalswinton, Dumfriesshire, 9 Dec. 1815. He was engaged in business as a banker in Edinburgh, and was a leading stockholder in the Carron Iron Company, in whose shops cannonades were first manufactured and from which they derived their name. In 1785 he purchased the estate of Dalswinton in Dumfriesshire, and here spent the latter part of his life, devoting his attention to agriculture (he introduced forin grass, or white bent, into Scotland, and wrote a treatise on it), and to experiments in ship-building. On 14 Oct. 1788 he first demonstrated the possibility of steam navigation by sailing a steam-propelled boat, 25 feet long and 7 broad, on the lake near his house. Miller had Robert Burns at one time as his tenant and correspondent. Consult: Woodcroft, 'Steam Navigation' (1848).

Miller, Warner, American manufacturer and politician: b. Oswego County, N. Y., 12 Aug. 1838. He was graduated from Union College in 1860; and for a year was professor of Greek and Latin at the Fort Edward Collegiate Institute. In the Civil War he served in the Fifth New York cavalry, enlisting as a private, and attaining the rank of lieutenant; he fought under Sheridan, and was taken prisoner at the battle of Winchester, was paroled on the field, and afterward honorably discharged. After the war he established a paper manufacturing business, in which he has continued to hold large interests. He has also been an active member of the Republican party, was delegate to the National Convention in 1872, and was elected to the New York legislature in 1874; and was a member of Congress from 1879 to 1881. In 1881, when T. C. Platt (q.v.) resigned from the United States Senate, Miller was elected to fill the vacancy, serving as Senator till 1887; in 1888 he was nominated for governor of New York by the Republicans, but failed of election. Later he has been interested in the Nicaragua Canal project, and was president of the Nicaragua Canal Company.

Miller, William, American religious leader: b. Pittsfield, Mass., 5 Feb. 1782; d. Low Hampton, Washington County, N. Y., 20 Dec. 1849. Most of his education he obtained through books procured by wood-chopping. He became a farmer at Poultny, Vt., in 1803, and in 1816 removed to Low Hampton, N. Y. In the War of 1812 he was captain of a company organized to protect the northern frontier. He was at first a student of Hume, Voltaire, Thomas Paine, and Ethan Allen, and an avowed deist; but afterward became a member of the Baptist Church at Low Hampton. After a prolonged study of the Bible, enlightened by no help excepting that of a concordance, he began in 1831 to preach the second advent of Christ. He was licensed as a preacher by the Church at Low Hampton, but was never

ordained. For a time all pulpits except the Roman Catholic and Episcopalian welcomed him. He first set the time of the second coming as somewhere between 21 March 1843 and 21 March 1844, and on 14 March 1844 proclaimed it as near at hand. Months intervened, and then, in October, the faithful gathered in their assemblies. At the end of November they dispersed. Many of the Second Adventists, or Millerites, as they were sometimes called, affiliated with other sects, but about 50,000 remained under the direction of Miller, who, on 25 April 1845, called a convention by which a declaration of faith was adopted, and the name of "Adventist" selected for the sect, which increased in numbers, and is to-day divided among six branches. Miller assisted in establishing, in 1840, 'The Signs of the Times and Exposition of Prophecy,' later called the 'Advent Herald.' He published 'Evidence from Scripture and History of the Second Coming of Christ about the Year 1843' in a Course of Lectures' (1842); a widely circulated 'Dream of the Last Day,' and other writings. Consult the biographies by Bliss (1853) and White (1875). See **ADVENTISTS**; **MILLENNIUM**.

Miller, William, English line engraver: b. Edinburgh 28 May 1796; d. Sheffield 20 Jan. 1882. He was educated in England and at the University of Edinburgh, and studied engraving at Edinburgh and also under George Cooke during a residence in London, after which he returned and settled in his native city. His work was much commended by R. W. Turner, and he engraved many plates after and in accordance with the suggestions of that painter. Of these the most important are: 'The Bass Rock in a Storm' (1826); 'Great Yarmouth' (1829); 'The Grand Canal, Venice' (1837); 'Modern Italy' (1839); 'The Bell Rock Lighthouse in a Storm' (1864); 'St. Michael's Mount' (1866). The chief features in his engravings are the remarkable skill with which he gives the tone and value of color effects in black and white; the boldness and freedom with the line is employed in expressing the movement and gloom of storm clouds, the transparent fluidity of tossing waves, and the glassy surface of still rivers.

Miller, William, Scottish poet: b. Bridgegate, Glasgow, August 1810; d. Glasgow 20 Aug. 1872. Uncertain health preventing his becoming a physician, he adopted the trade of wood-turning. He published 'Scottish Nursery Songs and Other Poems' (1863). One of his most popular poems is 'Wee Willie Winkie.'

Miller, William Henry Harrison, American jurist: b. Augusta, N. Y., 6 Sept. 1840. He was graduated from Hamilton College, Clinton, N. Y., in 1861 and in 1862 entered the army, serving through the war. He engaged in law practice in Fort Wayne, Ind., 1866-74; in 1874 removed to Indianapolis and formed a partnership with Benjamin Harrison, and under the latter's administration (1889-93) was attorney-general of the United States.

Miller, Fort, a former fortification on the site of the present village of Fort Miller, Washington County, N. Y.; on the Hudson River, 40 miles north of Albany.

Millerand, mèl-è-rân, Alexander, French Socialist: b. Paris 10 Feb. 1859. He was edu-

MILLER'S TALE OF THE CARPENTER — MILLET

ented at the Lycée Vanves and the Lycée Henri IV., was admitted to the bar in 1881, and in 1885 was elected to the Chamber of Deputies as a radical Socialist. Frequently re-elected, he became a leader of the parliamentary or opportunist Socialists, and in 1899 received the portfolio of commerce in the Waldeck-Rousseau cabinet. In this post he secured the passage of important laws for the benefit of workmen. He became proprietor (1889) of *La Voix*, which journal he made largely a vehicle for his own opinions.

Miller's Tale of the Carpenter, The, one of Chaucer's 'Canterbury Tales' (1475). The source of the tale is unknown.

Miller's-thumb, the English name for a small spiny fresh-water goby (*Cottus gobio*), of which many species occur in Europe and elsewhere. They are frequently called "bullheads" (q.v.), but are different from the small American catfish so called.

Millersburg, mill'ez-bérg, Ohio, village, county-seat of Holmes County; on Killbuck Creek, and on the Cleveland, A. & C. railroad; about 70 miles northeast of Columbus. It is a manufacturing village; its principal industrial establishments are flour and lumber mills, foundry, brick-yards, and machine-shops. In the vicinity are deposits of iron ore and bituminous coal. Pop. 2,000.

Millet, Aimé, à-mâ mè-lâ, French sculptor: b. Paris 1816; d. there 14 Jan. 1891. He studied art under David d'Angers (see **DAVID**, **PIXAR** **JEAN**), and the architect Viollet-le-Duc (q.v.), applied himself first to painting, and exhibited a picture in the exhibition of 1842, toiling at the easel for 10 years with no success. He meanwhile had turned his attention to the plastic arts, and exhibited his first statue, a 'Bacchante,' in 1845. This was followed by his 'Ariadne,' now in the Luxembourg, a 'Mercury' and a statue of 'Civic Justice' for the mairie of the First Arrondissement, Paris; the statue of a 'Young Girl' for a monument in the cemetery of Montmartre, an 'Apollo' for the façade of the New Opera House, and a bronze statue of 'Vercingetorix' (1865). Among his portrait and personal works are the statues of Chateaubriand at St. Malo; of Denis Papin, at Blois; and numerous busts. His style has all the realism of modern French sculpture, combined with a certain theatrical demonstrativeness, a vividness of expression, pathetic, tragic or passionate. Consult Dumesnil, 'Aimé Millet, Souvenirs Intimes' (1891).

Millet, Francis Davis, American artist: b. Mattapoiset, Mass., 3 Nov. 1846; d. 15 April 1912. He was graduated at Harvard 1869, and subsequently studied at the Royal Academy of Antwerp (1871-2). He became member of the National Academy of Design (1885). He designed the decorations of Trinity Church, Boston, and those in many important buildings in New York, Chicago, and elsewhere. Among his best known paintings are: 'At the Inn' (Union League Club); 'A Cozy Corner' (Metropolitan Museum of Art); and 'Between Two Fires' (National Gallery of British Art, London). He served as newspaper correspondent for the *London Times* and 'Harper's Weekly' at Manila (1898); and has translated Tolstoi's 'Sebastopol.'

Millet, Jean François, zhôn frân-swâ mè-lâ, French painter: b. Gruchy, near Cherbourg, 4 Oct. 1814; d. Barbizon 20 Jan. 1874. He was educated in the Academy of Design at Cherbourg, and received a bursary from that city which enabled him, in 1837, to proceed to Paris, where he entered the studio of Delaroche. This does not seem to have been a congenial home for his early art life, yet at first he struggled to comply with his surroundings and painted genres in the style of Watteau (q.v.) and Boucher (see **BOUCHER**, **FRANÇOIS**), as well as Biblical and mythological incidents, with landscape backgrounds. It was in 1848 that he really found himself, and hit upon the line of art in which he could give utterance to the sincere feelings of his heart. This turning point in his career was marked by the appearance of his genre painting, taken from country life, 'The Winnowers.' Henceforth his days were to be spent far from the glitter of Paris, the competition and jealousies of the studios; settling in Barbizon, on the edge of the forest of Fontainebleau, he devoted himself to the study and portrayal of peasant life. The hardship, toil and privation of the farm laborers he sympathized with acutely, and some have even accused him of being a social revolutionist, but he professed no views of this tendency, though his interpretation of the peasant's lot may be too gloomy and pessimistic, and his ironical bitterness of spirit such that it infected his canvas and clouded the beauty of external nature as depicted there. He himself was almost all his life battling with that poverty whose privations had early robbed him of his young wife. There is a profound pathos in his conception of the rural isolation and hardship of soil slavery, with all its stolid but unrequited patience, and this he has portrayed with a certain broad and impressionistic treatment which is both sincere and original. At first, his works were passed by or misunderstood, but gradually they were recognized at their true value, and he was hailed as the greatest painter of modern France. Since his death his pictures have been sold at enormous prices and are looked upon as the most precious pieces in private or public collections. His greatest picture, the 'Angelus' (1859), was bought at auction for \$32,000. Millet himself sold his picture 'The Woman with the Lamp' for \$2,800 in 1872. Shortly after it was sold for \$4,600, and again for \$7,000. In 1883 it fetched \$18,000. The most important of his other works are: 'The Sower' (1850); 'Man Spreading Manure' (1852); 'The Reapers' (1853); 'The Gleaners' (1857, in the Louvre); 'Death and the Woodcutter'; 'La Becquée' (Feeding Her Birds)—a mother feeding her three children from the same bowl. These all belong to his early period when he was tortured with sickness and harassed by debt. After the appearance of the 'Angelus' his reputation was established and he had reached smooth waters. In 1860 he produced his wonderful picture, the 'Sheep-Shearing,' in which he seems to express as much pity for the dumb beast as for the patience of the human toiler who is bent over it. In 1862 appeared the 'Potato Planters'; in 1863 'The Wool Carder,' and 'The Man with the Hoe.' In 1867 he was awarded at the Paris Exposition a medal of the 1st class. He took refuge in Cherbourg during the Franco-Prussian war, but returned to Barbizon in 1871, where he con-

MILLET—MILLIKEN'S BEND

tinued in broken health, though still working with untiring brush, until the end came.

Among the paintings of this artist now in the United States are: 'The Sower'; 'The Water Carrier' (Vanderbilt collection); 'A Peasant Grafting a Tree' (Rockefeller collection); 'The Turkey Tender' (C. A. Dana collection); 'The Buckwheat Threshers' and the 'Potato Planters' (Quincy Shaw collection); 'The Churners' (F. L. Ames collection); 'Potato Diggers' and 'Breaking Flax' (Walters collection).

The drawings, etchings, and pastels of Millet are eagerly sought after and always bring a high price at auctions or private sale. The most familiar is his own portrait, a sketch often reproduced. His 'Woman Feeding Chickens'; 'Flock of Sheep with Shepherd', the 'Newborn Lamb'; 'Laundresses on the Shore' are best known. Among his pastels are 'The Vine Dresser' and 'Butter Making.' All his works show masterly drawing, and the landscapes which appear in many of them are put in with an ease and atmosphere worthy of the best periods of French art. His coloring may be sombre, and he disregards the power of the human countenance as giving expression to the sentiment of his conception. But the life of each picture is to be found in the mimtable pose of the figures, and the suggestiveness of the background. The hands, shoulders, and feet of these figures, as they move in harmony with forms cumbrous, almost grotesque, are made to suggest the dull torture in which stolid and half bestial creatures are held under the yoke of toil and poverty. The light reflected upon these figures from religious sentiment or natural affection only serves to intensify the profound melancholy by which the story of their lives is clouded.

Consult: Sensier, 'La Vie et l'Œuvre de Jean François Millet' (1881); and its abridged English translation, Boston (1896).

Millet, a popular name for many grasses grown in the Old World as cereals, but in the New almost wholly as forage. The principal ones are: True or broomcorn millet (*Panicum miliaceum*); foxtail millet (*Setaria italica*); barnyard or Japanese (*Panicum crus-galli*); pearl or cat-tail millet (*Pennisetum typhoides*), and the African, Chinese, Indian, black and erroneously-called "pearl millet" (*Sorghum vulgare*). Sometimes *Echinochloa crus-galli* is called African millet. In general they constitute one of the most important groups of food-plants, since they are the staple diet of about one third of the world's population, the annual plantation in India alone being estimated at approximately 35,000,000 acres. The first three mentioned are the most important groups grown in the United States. The plants all thrive well upon rather light, well-drained soils, which should be prepared as for other cereal crops. In order to make a millet harvest succeed the harvest of other cereals, the seed is sown late in the spring. Broadcasting and drilling are both practised, the latter more extensively. Just after blossoming, the crop may be cut and cured for hay; for seed, just before the seed becomes fully mature to prevent loss from shattering. The hay makes valuable fodder, but some stockmen attribute various animal ailments to its excessive or exclusive use; others experience no such difficulties. The seed may be ground for stock food, but it is little used. For poultry, especially for young chicks, it is widely employed. Consult:

Farmers' Bulletin No. 101, United States Department of Agriculture, and the 'Year Book' of the Department for 1898. See GRASSES IN THE UNITED STATES.

Milligan, mil'igan, William, Scottish Presbyterian clergyman and commentator: b. Edinburgh 15 March 1821; d. Aberdeen 11 Dec. 1893. He was educated at the University of St. Andrews, entered the ministry of the Established Church of Scotland, held pastorates at Cameron and Kilconquhar, and was professor of Biblical criticism in the University of Aberdeen from 1860. He was one of the revisers of the New Testament and the author of 'The Higher Education of Women' (1878); 'Commentary on the Revelation' (1883); 'The Resurrection of the Dead' (1890); etc. He visited the United States in 1873 as a delegate to the Presbyterian General Assembly from the General Assembly of the Scottish Church.

Milligan College, in Milligan, Tenn.; a coeducational institution founded in 1882 under the auspices of the Disciples of Christ. It has a preparatory department and a college department; the courses lead to the degrees of A.B., B.S., and Ph.D. In 1910 there were connected with the school 16 professors and over 271 students. The library contained about 3,000 volumes. The grounds and buildings were valued at \$16,300, and the income was about \$37,000.

Milligan Decision, The, an important ruling of the United States Supreme Court in 1866. In 1864 an Indiana man named Milligan was arrested by a United States officer on charges of conspiracy, inciting insurrection, and giving aid to the enemy. He was tried by a military commission, found guilty, and sentenced to be hanged. His counsel filed in the circuit court a petition for a writ of habeas corpus, claiming that the plaintiff was a civilian in no way connected with the military service, and that he was not in a rebel State. The case was carried to the Supreme Court, where it was held that a military commission organized during the war in a State not invaded or in rebellion, and where the Federal courts were open and unobstructed, had no jurisdiction to try, convict or sentence for a criminal offense a citizen who was neither a resident of a State in rebellion nor a prisoner of war.

Milligram, the thousandth part of a gram. See WEIGHTS AND MEASURES.

Milliken's Bend, Engagement at. Milliken's Bend, La., on the west bank of the Mississippi, about 15 miles above Vicksburg, was the base of some of the military operations against that place and the lower Mississippi. Early in June 1863, when Grant was besieging Vicksburg from the east, Gen. E. Kirby Smith, commanding the Confederate department of the Trans-Mississippi, sent Gen. J. G. Walker's division of 4,000 men to seize the place and other points on the river, and open communication with General Pemberton, in Vicksburg, with the object of furnishing him supplies, or, failing in that, to cover his escape across the river. Walker moved to Alexandria, La., and reported to Gen. R. Taylor, commanding in West Louisiana, and was sent in transports up the Washita and Tensas rivers, until abreast of Vicksburg, when he landed and marched across to Richmond. At this time Milliken's Bend was held by Gen. E. S. Dennis,

MILLIKIN—MILLS

with about 1400 men, mostly colored troops. A reconnoitering party sent out by Dennis was driven back by the Confederates. Walker arrived at Richmond at 10 A. M. of the 6th, and was ordered by Taylor to send one brigade to Young's Point and one to Milliken's Bend, distant respectively 20 and 10 miles, and to hold a third brigade in reserve six miles in advance of Richmond. Harris' brigade moved at night on Young's Point, was delayed, and accomplished nothing. Gen. H. E. McCulloch, with a Texas brigade of 1,600 men and 200 cavalry, marched from Richmond at 6 P. M. of the 6th, and at 3 A. M. of the 7th, when, within one and a half miles of Milliken's Bend, the Union skirmishers were encountered and the Confederate advance driven back in some disorder; but McCulloch rallied his men and pushed on, driving the Union troops back slowly to their main line, carrying the Union breastworks and driving the Union troops back to the bank of the river, where two gunboats came to their assistance and, pouring shells into the ranks of the Confederates, obliged them to withdraw and return to Richmond. The Union loss was 127 killed, 287 wounded, and 266 missing; the Confederates lost 44 killed, 131 wounded, and 10 missing. Consult 'Official Records,' Vol. XXIV.

E. A. CARMAN.

Millikin, James, American banker and philanthropist: b. Pennsylvania 2 Aug. 1830; d. Orlando, Fla., 2 March 1909. In 1860 he engaged in banking, later founded the firm of Millikin & Company at Decatur, Ill., now the Millikin National Bank, of which he was the president. He is also president of the Union Works. Mr. Millikin was long known for his philanthropic and benevolent enterprises; for his generous liberality to charities and churches, irrespective of denominations, and for his ready recognition of able and deserving young men, to many of whom he has given valuable assistance in accumulating wealth. He founded the Anna B. Millikin Home, an institution for the care of aged women and children, built and supported mostly by him, and named by the board of directors after his wife, Anna B. Millikin. He founded also the James Millikin University, dedicated in 1904 by President Roosevelt.

Mills, John, American military engineer: b. Wheatland, Mich., 31 Dec. 1858. He was graduated from West Point in 1881 and served in the engineering corps until 1893, after which he performed various engineering duties under the government, and in 1894-8 was chief-engineer of the United States Lighthouse Board at Washington. In 1898-1900 he was on duty with the engineers' battalion at Willet's Point, N. Y., and in Cuba. He was sent as delegate to various engineering conferences in Paris in 1900, and visited Egypt on inspecting duty. Since 1900 he has been on duty at Puget Sound, engaged in river and harbor improvements and fortifications.

Mills, Albert Leopold, American military officer: b. New York city 7 May 1854. He was graduated from West Point in 1879 and was commissioned in the cavalry. He served in several campaigns against the Indians and in 1894-8 was instructor in the United States military school at Fort Leavenworth, Kan. Upon the opening of the war with Spain he was ordered

to the front, where he rendered distinguished service at the battles of Las Guasimas and Santiago and was brevetted major and lieutenant-colonel. From 1898-1906 he was superintendent at West Point, with the rank of colonel and regimental captain.

Mills, Benjamin Fay, American Unitarian clergyman: b. Rahway, N. J., 4 June 1837. He was graduated from Lake Forest University (Ill.) in 1879, was ordained to the Congregational ministry in 1878, held a pastorate at Rutland, Vt., was a prominent evangelist in 1886-97. In 1897 he withdrew from the Congregational denomination owing to his liberal views, and in 1897-9 conducted independent religious meetings in Boston. In October 1899 he became pastor of the First Unitarian Church at Oakland, Cal. Among his books are: 'Power from on High' (1889); 'Victory through Surrender' (1892); 'God's World' (1893).

Mills, Clark, American sculptor: b. Onondaga County 1 Dec. 1815; d. Washington, D. C., 12 Jan. 1883. He went south, learned the millwright's trade, worked at New Orleans, and later at Charleston, where he was employed by a plasterer, and discovered a method for taking a cast from the living face which enabled him to make plaster busts cheaply. In 1845 he completed a bust in marble of Calhoun, which was placed in the Charleston city-hall in 1846. In 1848 he was appointed by the government to execute an equestrian statue of Andrew Jackson. This was the first large statue cast in metal in the United States. Mills was obliged to learn casting, since there was then no foundry in the country adequate to the work, and when the statue was at last completed it was at a loss to himself of \$7,000. This was later repaid to him by Congress in an appropriation of \$20,000 for a replica at New Orleans. His colossal equestrian statue of Washington, depicting the general at the battle of Princeton, was unveiled at Washington on 22 Feb. 1860. He also cast from designs by Thomas Crawford (q.v.) the statue of 'Freedom' which was placed surmounting the dome of the Capitol in 1863, and took a life-mask of President Lincoln shortly before the latter's death.

Mills, Darius Ogden, American banker and capitalist: b. North Salem, Westchester Co., N. Y., 25 Sept. 1825; d. 3 Jan. 1910. He was educated in the North Salem Academy and the Mount Pleasant Academy, Sing Sing, N. Y., later becoming cashier of the Merchants Bank of Erie Co., Buffalo, N. Y. In 1849 he went to California where he founded the banking house of D. O. Mills and Co.; from 1864-7 was president of the Bank of California, San Francisco, and after the failure of the institution again taking charge of it until 1878. After 1880 he was largely interested in New York real estate; also prominent in philanthropic enterprises, the Mills Hotels (q.v.) being the most noted examples of his generosity.

Mills, David, Canadian jurist: b. Oxford, Ontario, 18 March 1831. He was educated at the University of Michigan and entered early upon a public life. He served in the Dominion House of Commons 1867-96 and was editor of the *Canada Daily Advertiser*, London, Ont., 1880-7. In 1876-8 he was minister of the in-

MILLS—MILLSAPS COLLEGE

terior and was minister of justice 1897-1901, since when he has been justice of the Supreme Court of Canada. He has contributed to the magazines many articles on public questions and has published 'The English in Africa' (1900).

Mills, Job Smith, American United Brethren bishop: b. near Portsmouth, Ohio, 28 Feb. 1848. He was graduated from the Illinois Wesleyan University and studied for the ministry. In 1874-80, 1885-7 he was pastor of Otterbein University, Watertown, Ohio, and in 1887-93 was professor in various branches and then president of Western College, Toledo. He was made bishop in 1893 and has since visited the principal universities of Europe. He has written: 'Mission Work in West Africa' (1898); 'Holiness' (1902); etc.

Mills, Lawrence Heyworth, American philologist: b. New York 1837. He was graduated at New York University in 1857, and at Fairfax Episcopal Theological Seminary, Va.; and entered the Episcopal ministry in 1861. He was stationed in Brooklyn for six years; retired from the ministry in 1867; studied Gnosticism and the Avesta in Europe 1872-87; and in the last named year, having established his reputation as an authority on the Zend-Avesta, went on Max Müller's invitation to Oxford, where he became professor of Zend philology in 1898. He contributed largely to Oriental journals various papers on the Gāthās and early Zoroastrianism; translated 'Zend-Avesta' (Part III. in 'Sacred Books of the East,' 1887); and wrote: 'Study of the Five Zarathustrian Gāthās' (1894); 'Gāthās of Zarathustra in Metre and Rhythm' (1900); 'Dictionary of the Gāthic Language of the Zend-Avesta' (1902); and 'Zoroaster, Philo, and Israel' (1903).

Mills, Robert, American architect and engineer: b. Charleston, S. C., 1781; d. Washington, D. C., March 1855. He was a pupil of the architect Benjamin Latrobe (q.v.), and beside designing important structures in Philadelphia, including the single-arch bridge across the Schuylkill, erected custom-houses and marine hospitals in various parts of the United States and the Washington Monument in Baltimore. In 1837 he was appointed architect of the general government at Washington, where he built the Treasury, General Post-Office, and Patent Office, and designed the Washington Monument. He published 'Statistics of South Carolina' (1826); 'American Pharos, or Lighthouse Guide' (1832); etc.

Mills, Roger Quarles, American lawyer and politician: b. Todd County, Ky., 30 March 1832. He moved to Texas in 1849, and studied law; was admitted to the bar at 20, the Texan legislature removing the disability of minority; and began practice at Corsicana. In 1859 he was elected to the Texas legislature. On the outbreak of the Civil War he joined the Confederate service, and fought throughout the war. In 1872 he was elected to Congress as a Democrat, serving till 1892; he was chairman of the House committee on ways and means, and drafted the Mills Tariff Bill, which, however, failed to become a law. In 1892 he was elected to the Senate to fill an unexpired term, and in 1893 was re-elected for the full term of six years.

Mills, Samuel John, American Congrega-

tionalist clergyman: b. Torrington, Conn., 21 April 1783; d. at sea 16 June 1818. He was graduated from Williams College in 1809, where he had as an undergraduate organized the first society of foreign missionaries in America, and he afterward studied at Yale and at Andover Seminary. In 1810 he founded the American Board of Commissioners for Foreign Missions. He was licensed to preach in 1812 and at once went on a missionary tour through the Southern States, and made a second tour in 1814, succeeding in organizing various religious societies. He was ordained to the ministry in 1815 and in 1817 was sent to Africa to select a site for a colony. He died on the way home.

Mills, Walter Thomas, American Socialist lecturer: b. Duane, N. Y., 1856. He was graduated from Wooster University in 1885. He was one of the editors of the 'New Voice' (1885-7); and editor of the 'Statesman Magazine,' Chicago (1887-90). He was the first delegate sent by the American Federation of Labor to the British Trades Congress in 1892; and was general chairman on Labor Congresses for the World's Fair at Chicago. In 1893-1900 he was engaged in trying to establish a self-supporting farm scheme; in 1900 he allied himself with the Socialist party, and established the International School of Social Economy, of which he has been principal. This school had, in 1903, 2,800 correspondence students, and held four sessions of special training school courses. He has written 'Science of Politics' (1887), 'Social Economy' (1903); etc.

MILLS BILL. See **TARIFF**.

Mills College, at Mills College (P. O.) in Alameda County, Cal., was founded in 1871 as Mills Seminary for Young Women. It was chartered as a college in 1885. It has preparatory and business departments and a college department, the courses of which lead to the degrees of A.B. and B.L. In 1910 there were connected with the college 35 instructors and 135 students. The property was valued at over \$400,000.

Mills Hotels, the philanthropic enterprise of D. O. Mills (q.v.) inaugurated in 1897. There are three hotels situated in the tenement districts of New York City and built and operated for the purpose of housing and feeding the unemployed or small-salaried man. The Bleeker Street Hotel has 1,554 rooms, the Rivington Street Hotel 600, and the Seventh Avenue Hotel 2,000, the majority of which rent for 20 cents per night. These bedrooms are all separate, about 7½ x 6 feet in size, and containing a single iron bedstead, one chair and a closet. There are large reading, writing and smoking rooms, a well stocked library, free shower baths, custom laundry, news-stand, etc., conducted as in other first-class hotels. The restaurant is conducted so as to give good food, nutritious, well cooked, and at a price remarkable for cheapness. The average cost of living in the hotels has been from \$3.50 to \$4 per week, making them a haven for respectable poor men.

Millsaps College, in Jackson, Miss., founded in 1892 by the M. E. Church South. The courses of study lead to the degrees of A.B., B.S., and Ph.D. In 1910 there were connected with the school 13 professors and instructors and 250 students. There were about 5,000 bound volumes and 3,000 pamphlets in the library, valued at \$11,000. The grounds.

MILLSAUGH — MILNE

buildings, and apparatus were valued at \$90,000; the productive funds were \$300,000; and the total annual income was \$21,000. In 1910 the benefactions were \$2,400.

Millsaugh, mil'spā, Charles Frederic, American botanist: b. Ithaca, N. Y., 20 June 1854. He studied a year at Cornell; was graduated at the New York Homoeopathic Medical College in 1881; practised medicine for 10 years; and became botanist of West Virginia University in 1891, professor of medical botany in the Chicago Homoeopathic Medical College in 1897, having been curator of the department of botany in the Field Columbian Museum since 1894. He traveled in Mexico, in Brazil, and in the West Indies, and is the author of 'American Medical Plants' (1887); 'Flora of St. Croix, D. W. I.' (1902); 'Plantae Yucatane' (1903); etc.

Millsaugh, Frank Rosebrook, American Protestant Episcopal bishop: b. Nichols, N. Y. He was graduated from the Shattuck School, Faribault, Minn., in 1870, and from the Seabury Divinity School there in 1873. He entered the Episcopal ministry in the year last named, served as missionary in Minnesota 1873-6, was subsequently dean of the Omaha (Neb.) Cathedral, rector of St. Paul's, Minneapolis, and dean of Topeka (Kan.) Cathedral. In 1895 he was consecrated bishop of Kansas.

Millstone, one of the two cylindrical stones used to grind grain into flour (q.v.). The best foreign stones are the German basaltic lava quarried near Cologne, and the French burstone; both are imported into the United States in small pieces from which the cylindrical stone is built up. The native stone is commonly used in the single piece; a sandstone found in Ulster County, N. Y., and in Lancaster County, Pa., and a burstone much like the French, are the best materials, being hard and tough and having a cellular structure, which in the burstone is due to the presence of fossil casts. The lower stone is usually fixed; the upper stone is the "runner." Each stone is deeply scored with furrows, which lead the milled grist away from the centre; the intervals are styled "land"; and the hole in the centre is called the "eye." A depression about the eye is the "bosom." The scheme for scoring the stone varies greatly. The roller process (described under *Flour*) has relegated the millstone to the minor grist mills.

Millvale, Pa., borough, in Allegheny County; on the Allegheny River, and on the Pittsburg & W., the Buffalo, R. & P., and the Pennsylvania R.R.'s; opposite Pittsburg. It is really an industrial suburb of Pittsburg; its chief manufactures are lumber, iron products, saws, dressed stone, and steel products. The government is administered by a burgess, who holds office three years, and a council. The borough owns and operates the electric light plant and the waterworks. Pop. (1890) 3,809; (1900) 6,736; (1910) 7,861.

Millville, mil'vil, N. J., city in Cumberland County; on the Maurice River, and on the Pennsylvania railroad; about 43 miles south of Philadelphia. In 1801 Millville was incorporated as a town, and in 1866 received its city charter. It is a manufacturing city; its chief industrial establishments are foundries, glass factories, dye works, blancheries, cotton mills, and ma-

chine shops. It has a fine high school, two libraries, several good church buildings, a large park in which is Union Lake, a body of water about three miles long and three fourths of a mile wide, and a number of fine private residences. The government is administered under a charter of 1873, which provides for a mayor, who holds office three years, and a common council, 12 of whose members are elected from wards, and one at large. Pop. (1890) 10,002; (1900) 10,583; (1910) 14,451.

Mil'man, Henry Hart, English historian and poet: b. London 10 Feb. 1791; d. near Ascot 24 Sept. 1868. He was graduated from Brasenose College, Oxford, in 1814, became a fellow of the college in that year, took orders in 1816, was appointed incumbent of St. Mary's, Reading, in 1818, and was professor of poetry at Oxford in 1821-31. In 1835 he became rector of St. Margaret's, Westminster, and in 1849 dean of St. Paul's. His best-known works are his 'Fazio,' a poetical drama (1815), first presented at London in 1818 with great success; 'History of the Jews' (1830); and his 'Latin Christianity' (1855), an excellent general survey written with admirable candor and breadth. Among his other publications are: 'The Fall of Jerusalem' (1820), a dramatic poem; 'History of Christianity under the Empire' (1840). Consult A. Milman, 'Henry Hart Milman' (1900).

Mil'more, Martin, American sculptor: b. Sligo, Ireland, 14 Sept. 1844; d. Roxbury Highlands, Boston, Mass., 21 July 1883. He studied at Boston with Thomas Ball, and established there his own studio. In 1863 he executed for the Sanitary fair the statuette 'Devotion,' later studied for a time in Rome, where he made busts of Pius IX., Charles Sumner, Wendell Phillips, Emerson, and others of prominence, and designed the soldiers' and sailors' monument on Boston Common, for which he had been commissioned by the city. This monument, generally regarded as his greatest work, was dedicated in 1877. He executed also the soldiers' monument at Charlestown, Mass., a mediocre composition 'America' at Fitchburg, Mass., and the 'Weeping Lion' at Colby University, Waterville, Me. His bust of Sumner is in the Metropolitan Museum, New York; that of Ticknor in the Boston Public Library; and a bronze copy of that of Phillips is also in the Boston Library, to which it was presented by the Phillips Memorial Association in 1900. One of his best known works is the huge granite Sphinx in Mount Auburn cemetery, Cambridge, Mass.

Miln, Louise Jordan, English journalist and author: b. 5 March 1864. After extensive travel she contributed to various London journals, such as the *Pall Mall Gazette*, the *Morning Post*, the *Times*, and particularly the *British Realm*, edited by her husband, G. C. Miln. Among her publications are: 'When We Were Strolling Players in the East' (1894); 'Quaint Korea' (1895); 'An Actor's Wooing' (1896); and 'Little Folk of Many Lands' (1899).

Milne, miln, John, English geologist: b. Liverpool, 1850. After study at the Royal School of Mines, London, he traveled in Iceland, mined in Newfoundland (1873-4), and in 1875 became professor of mining and geology under the Japanese government. He is a recog-

sized authority on seismology, published a volume on 'Earthquakes' ('Natural Science' series), and established the Japanese Seismological Society (1886).

Milne-Edwards, Henri, ôñ-rê mèl-nâ-dwâr, French zoologist: b. Bruges 23 Oct. 1800; d. Paris 29 July 1885. His father was an Englishman, but the son was born and educated on the Continent, became M.D. at Paris in 1823; then began to study the zoology of lower animals; made two dredging expeditions near Granville in 1826 and 1828, describing his finds in a paper entitled 'Récherches anatomiques sur les Crustacés' (1828); was elected to the Academy of Sciences in 1838, succeeding Cuvier; in 1841 became professor of entomology in the Museum; held professorial chairs in the scientific faculty of the University of Paris; and in 1864 became director of the Museum. From 1837 he was an assistant editor of the 'Annales des Sciences Naturelles.' He established the idea of the division of physiological labor and was not in accord with modern theories of evolution, as is to be seen from his 'Introduction à la Zoologie générale' (1853). He also wrote 'Éléments de Zoologie' (1834); 'Histoire naturelle des Crustacés' (1837-41); 'Histoire naturelle des Coralliaires' (1858-60); and an unfinished work, 'Leçons sur la Physiologie et l'Anatomie comparées de l'Homme et des Animaux' (1855-84).

Mil'ner, Sir Alfred, Viscount Milner, English administrator: b. Bonn, Germany, 1854. He studied in Germany, where his father had been instructor in English at the University of Tübingen, then at King's College, London, and at Balliol, Oxford; was fellow of New College, Oxford; studied law; and after several years in journalism, part of the time on the *Pall Mall Gazette*, became private secretary to Mr. Goschen, chancellor of the exchequer, in 1887. From 1889 to 1892 he was under-secretary of state for finance in Egypt; in 1892 became chairman of the Board of Inland Revenue; and in 1897 was appointed to the double post of high commissioner for South Africa and governor of Cape Colony. He still holds the former post. In 1900 he became administrator of the Transvaal and Orange River colonies, of which he was made governor in 1902. He took a prominent part in all negotiations with the Boers before, during, and after the war. He was made G.C.B. and baron in 1901 and viscount in 1902, is a man of much culture, and wrote 'England in Egypt' (1892).

Milnes, mîlz, Richard Monckton. See HOUGHTON, RICHARD MONCKTON MILNES.

Milo, mî'lo (MÎLOW), ancient Greek athlete. He was a native of Crotona, in Magna Græcia, Italy, and celebrated for his great strength. He bore off the prize six times in the Olympic games, and on an equal number of occasions at the Pythian. He was appointed to command an army against the Sybarites, and at the battle at the Crathus, 511 B.C., his great strength is said by Diodorus to have given the victory to the Crotonians. Many anecdotes are related of him. He once carried a heifer of four years to the sacrifice on his shoulders, killed it with a blow of his fist, and afterward, it is added, ate the whole of it on one day. His death is characteristically related. When enfeebled by age he attempted to rend open the

trunk of a tree partially split by wood-cutters, but the wood closing on his hands, held him fast, and he was attacked and devoured by wolves.

Milo, Titus Annius, Roman tribune and political leader: b. Lanuvium in early part 1st century B.C.; d. district of Thurii 48 B.C. In 57 B.C., when tribune of the plebs, his quarrel with Publius Clodius began. Seeking preferment in the state, he became the ally of Cneius Pompey, urging the recall of Cicero from exile, whither he had been sent at the instance of Clodius, as a pretext for their acts. Bands of gladiators in the employ of Milo and of Clodius kept Rome in constant terror by their skirmishes. Finally, in a clash at Boville, on the Appian Way, Clodius was murdered 20 Jan. 52 B.C. Milo was impeached for acts of violence in occupying public places and going about under arms; and for bribery in his canvass for the consulship. His trial began 4 April 52 B.C. Cicero undertook his defense, but found opinion such that the speech was not made. In a revised and enlarged form it was sent by Cicero to Milo at Massilia (Marseilles), whither he had gone into exile upon his condemnation under the first count.

Milo, or Milos. See MILOS.

Mil'osh, prince of Servia. See SERVIA; OBRÉNOVITCH.

Milouna (mî-loo'nâ) Pass, Greece, a frontier-pass of the Olympian Mountains in Thessaly, a few miles north of Tyrnavos. On 18 April 1897 it was the scene of a fierce battle between the Turks and Greeks during the Græco-Turkish war of that year. About 50,000 men were engaged on both sides, and the Greeks were defeated with heavy loss.

Milreis, mîl'rês, or Milrei, a Portuguese coin and the unit of account in Portugal. A thousand reis is one milrei, equal to \$1.06. In enumeration the figure \$ is used to denote the thousandth place, thus one milrei is written \$1000. The colon marks the place of centos (one million reis), the period the place of thousands of millions.

Mil'roy, Robert Huston, American soldier: b. Washington County, Ind., 11 June 1816; d. 1890. He was graduated from Norwich University, Vt., in 1843 and served in the Mexican War, after which he studied law and was admitted to the bar in 1849. In 1851 he was appointed justice of the 8th judicial circuit court of Indiana. When the Civil War broke out he organized a company of volunteers and was mustered into service as colonel, later receiving the rank of brigadier-general, and in 1862 was made major-general. In 1863 he was engaged in battle with a superior force under General Lee and after a gallant fight of three days' duration was compelled to retreat. An investigation of his conduct followed, which resulted favorably for Milroy, who, however, resigned in 1865. He was trustee of the Wabash & Erie railroad in 1868, in 1868-74 was superintendent of Indian matters in Washington Territory and in 1874-85 Indian agent.

Miltiades, mîl-tî'a-dêz, Athenian general: d. 489 B.C. He was a descendant of the Philaides, and, after being archon at Athens in 524, inherited a minor principality in the Chersonesus in 518. He governed well there; accompanied Darius against the Scythians in 515; and being left at the bridge across the Danube urged the

destruction in order that Greece might thus be rid of a possible Persian enemy. This plan was vetoed by Histieus, another Greek tyrant. In 493 he left his kingdom for fear of the Persians, and upon their invasion of Greece in 490 became one of the ten generals of the Athenian army. Each of the other generals retired in Miltiades' favor, but he refused to lead the army until his own day of command came. Then he won the great battle of Marathon, routing the Persian land forces. The victorious general in the next year asked the state of Athens for a fleet of 70 ships, got his request, but did not explain that he wished to punish the people of Paros, and, when his expedition failed and its purpose was known, he was impeached, fined 50 talents, and imprisoned for lack of ability to pay. He died in prison of a wound got at Paros.

Miltiades, also called Melchides, Pope or bishop of Rome from 2 July 310 to 10 or 11 Jan. 314. He is best known as having sat as presiding officer at a synod consisting at first of five bishops, then of 20 bishops, held at Rome in 313, by desire of the Emperor Constantine, to hear a petition from the Traditores or Catholics in North Africa who had, on demand of the Emperor Diocletian, given up their sacred books and thus, in the opinion of those who resisted the demand, forfeited the rights and privileges of church membership. The action of the Traditores split the Church into two bitter factions, a condition that was not suppressed until several synods and other courts, of which the Roman synod was one, had effectually quelled the movement by denying the pleas of the Traditores on every occasion. Nothing is known of the early history of Miltiades, except that he was born in Africa, and the date of his death is uncertain.

Miltitz, Karl Von, German ecclesiastic: b. about 1490; d. about 1529. He was the son of a nobleman of Saxony, entered upon a clerical career as priest and subsequently entered the Church as Canon of Mainz, Treves and Meissen. By favor of Pope Leo X, after appointment as a papal notary in 1515, he was chosen by that pontiff to confer with Luther, then very troublesome to the Church authorities, also with Frederick, the Wise, of Saxony, Luther's protector. The sale of indulgences had been condemned by Luther and Miltitz was dispatched to the scene of Luther's activity with a view to pacification. The whole subject was earnestly discussed and as an outcome of the conference, Luther promised to submit and possibly recant his heretical opinions. Later meetings between the Saxon priest and Miltitz took place at Altenberg, Liebenwerda and Nichtenberg, but the triumph of the Pope's envoy was annulled by the receipt of a Papal bull of denunciation before the conference came to an ending. Miltitz was subsequently sent to discipline Tetzel, the priest who had aroused Luther's ire and denounced him as being both indiscreet and unclerical. Miltitz died, it is supposed, by drowning when on his way back to the Vatican.

Milton, John, English poet: b. London 9 Dec. 1608; d. London 8 Nov. 1674. He was the son of John Milton (d. 1647), a prosperous and cultivated scrivener with marked leanings to Puritanism, and Sarah Jeffrey (d. 1637), of

whom little is known. The pair had six children, three of whom came to maturity. The eldest of these was Anne, mother of the infant girl upon whom Milton wrote his elegy, 'O fairest flower, no sooner blown than blasted,' of Edward Phillips, author of 'Theatrum Poetarum,' and of the hack-writer, John Phillips, both of whom Milton taught. She married for her second husband Thomas Agar. John, the poet, was the second of the Miltons' surviving children. The youngest was Christopher (1615-1693), who became a loyalist and a Roman Catholic, and was knighted and made a judge by James II.

Milton was born in Bread street, Cheapside, at the sign of the Spread Eagle, where his father conducted his business. The elder Milton was a talented organist and composer, who is said to have taught his son to play the organ, and to have made his house the resort of the best musicians of the day. John was beautiful in childhood, and soon showed literary and scholarly proclivities. He was at first taught at home by Thomas Young, afterward a noted Puritan clergyman, to whom he addressed his fourth Latin elegy. Then he attended Saint Paul's school under the two Alexander Gills, profiting from the classical acquirements of the elder. Here he formed the most memorable of his friendships, that with Charles Diodati, the son of an Italian Protestant who had settled in London as a physician. He spent between four and five years at this school, straining his eyes with study, learning five languages, and reading much poetry, especially that of Spenser, whom he later acknowledged as a master, and Joshua Sylvester's (q. v.) uncouth translation of Du-Bartas, which had a slightly deleterious influence upon his own early poetical compositions. Metrical paraphrases of Psalms CXIV and CXXXVI, preserved by Milton, furnish specimens of his juvenile accomplishments.

On 9 April 1625 he matriculated as a pensioner of Christ's College, Cambridge, his tutor being William Chappell, a religious controversialist, afterward Bishop of Cork. With this tutor Milton had some unexplained trouble, which apparently led to a short rustication and to his transfer to another tutor. The interlineation in the manuscript of Aubrey's sketch of the poet to the effect that Chappell "whipt" his most famous pupil may refer to some sort of personal encounter, or else may represent anti-Puritan gossip.

It is abundantly clear from later references to Cambridge in his writings, that Milton, although he was honored for his character and his scholarship, and was several times selected to represent his college as a public speaker, had no great respect for the university's methods and ideals. His beauty of person and his chaste life gained him the nickname of "the lady," and he seems to have formed no special friendships with such promising undergraduates of other colleges as Thomas Randolph (q. v.) and Edmund Waller (q. v.), his seniors, or with John Cleveland (q. v.), the satirist, and Henry More (q. v.), the Platonist, junior members of his own college. This aloofness from his fellows and his apparent inability to find inspiring personalities among his instructors probably increased his absorption in his studies and encouraged him to correspond in Latin with Dio-

dati, then at Oxford, as well as to compose poetry, in both Latin and English, not inconsiderable in quantity and extraordinarily good in quality. 'On the Morning of Christ's Nativity' (1629) is the crowning performance of this period and, despite some youthful defects of fantastic extravagance, is one of the few really great odes in our literature. Less excellent but still memorable are the lines on Shakespeare (1630), the sonnet 'On his Having Arrived at the Age of Twenty-Three,' and 'An Epitaph on the Marchioness of Winchester.'

Milton, whose brother Christopher had followed him to Christ's, took his bachelor's degree 26 March 1629, and his master's 3 July 1632. He tells us that the college authorities would have been glad if he could have continued to reside with them—probably as a fellow. His design had been to take orders in the church; but the high-church reaction, which Archbishop Laud was fostering, was obnoxious to him, and he was unwilling to come under the control of that masterful prelate. Theological difficulties and objections to an elaborate ritual do not seem to have weighed greatly with him at this time—certainly not to such a degree as the natural aversion of a proud and liberty-loving spirit to submit to the restraints imposed by an ecclesiastical organization dominated by a zealot. No other profession specially attracting him—though there are hints that he thought of the law—he gave himself up to reading and study, with the hope that he might later compose something the world "would not willingly let die." As this meant that for several years he must be a charge upon his father, the latter surely deserved the thanks conveyed to him in the Latin poem entitled 'Ad Patrem,' and he should be considered one of the most farseeing of parents.

From July 1632 to April 1638 Milton lived at his father's semi-suburban residence at Horton, in Buckinghamshire. He visited London to purchase books and to take lessons in mathematics and music; but he doubtless found his chief interest at home in studying the classics and French and Italian literature, and in enjoying the beauties of the country around him. His occupations and ideals seem to be described in the companion poems 'L'Allegro' and 'Il Penseroso,' which are generally assigned to the second half of 1632; unless, indeed, these idyllic pieces, contrasting as they do two varieties of temperament and modes of life, represent the perplexed state of his mind when he was choosing between a secular and an ecclesiastical career, and belong to a slightly earlier period. To the Horton epoch we certainly owe three of the most notable of his so-called 'Minor Poems'—the songs and rhymed speech entitled 'Arcades,' the masque 'Comus,' and the pastoral elegy 'Lycidas.' The first named was part of an entertainment given before the Countess-dowager of Derby at Harefield in 1633 or 1634. The music for this was furnished by the composer Henry Lawes (q.v.), a friend of Milton's family, and their copartnership in the slighter performance probably led to their association in providing a masque for the celebration of the entrance of the Earl of Bridgewater upon his duties as president of the council of Wales. 'Comus,' as the masque has been called without Milton's authorization, was probably performed

in the great hall of Ludlow Castle on Michaelmas-night (29 September) 1634. So many of Lawes's friends asked afterward to be allowed to read it that the composer had an edition published anonymously in 1637. From that day to this it has been one of the most admired of English poems, and whatever its defects of construction, it is unsurpassed as an idealistic presentation of the power and charm of personal purity. The year that 'Comus' was printed saw also the writing of 'Lycidas,' which has been pronounced by Tennyson to be a "touchstone of poetic taste" and by Dr. Johnson to be a poem which no man would pretend to enjoy if he did not know that Milton was its author. This elegy was first published in 1638 in a volume of academic tributes to Edward King, a successful rival of Milton's for a fellowship, who was drowned in the Irish channel in August 1647. The apparent absence of great personal interest on the part of the poet in his subject, and the decreased toleration of the conventions of pastoral poetry, probably account for much of the adverse criticism 'Lycidas' has received; but it should be remembered that Milton could have attained the requisite sincerity of utterance by centering his thoughts and emotions upon the loss sustained by the church in the death of so promising a clergyman, and that such consummate art of versification and diction as 'Lycidas' displays and such a felicitous adaptation of a time-honored form of poetry to comparatively modern uses should render a poem, which a series of competent judges has pronounced a masterpiece, unamenable to the censure of the catholic reader. On the other hand, it may be remarked that it seems somewhat uncritical to rank, as is often done, these poems of the young poet of Horton, admirable but still not magnificent in scope above the sublime masterpieces which gave Milton his place among the supreme poets of the world. It is scarcely conceivable that if Milton had died immediately after writing 'Lycidas,' his name would now be widely known outside the English-speaking nations.

In 1638, after his mother's death, Milton, through his father's generosity, was enabled to take a foreign tour in a style befitting a gentleman. At Paris he met Grotius (q.v.), but he did not like the city and passed soon into Italy, going by sea from Nice to Leghorn. He spent about a year on the peninsula, two visits of some two months each being given to Florence, where he made friends among men of culture, and impressed them by his accomplishments, both in the classics and in Italian. In Rome his outspoken protestantism almost got him into trouble. At Naples he formed an acquaintance with the aged Marquis Manso, the protector of Tasso and Marini, to whom he addressed some Latin verses important as showing that he was planning an epic upon King Arthur. Here he abandoned his intention of visiting Sicily and Greece, since the political news from England was too disturbing to allow a patriot to wander far from home. He made a leisurely return, was in Geneva early in July 1639, where he probably heard of the death of Diodati, and landed in England toward the end of the month.

The literary memorials of the tour consist of a few fluent Italian sonnets and a canzone (which afford shadowy evidence of a love affair with a young lady of Bologna), and some Latin

JOHN MILTON

verses, including three epigrams to the noted singer, Leonora Baroni. Milton does not seem to have profited greatly from what he saw of the treasures of plastic art, but his contact with historic places and with the natural beauties of Italy, and his association with great men, of whom Galileo, whom he met at Florence, is the most illustrious, must have broadened and deepened his capacities of thought and feeling. With the close of his journey and the composition of what is practically his last, and plainly his best, Latin poem, the touching pastoral elegy on Charles Diodati, entitled 'Epitaphium Damonis,' Milton's first period ends. The comely, accomplished young man, who blends the grace of the Cavalier with the serious purpose of the Puritan, gives place to the strenuous controversialist, the zealous reformer in Church and State, the idealistic partisan. The poet is not entirely swallowed up in the prose man, but he is nearly submerged.

On his return to England Milton took lodgings in Saint Bride's Churchyard and began to tutor the two children of his sister by her first marriage, Edward and John Phillips. Then he moved to a house in Aldersgate street, where his nephews boarded with him. Here he lived the life of an abstemious student and developed and practised the stimulating, though rather visionary, educational theories later outlined in his letter to Hartlib (June 1644). In 1643 he received a few more pupils, and he continued to play the part of schoolmaster until the autumn of 1647, when his father's death apparently left him in fairly comfortable circumstances.

Meanwhile he had been giving earnest of his literary and scholarly ambitions and of his interest in public affairs, which were rapidly approaching chaos. He planned to write some poem on a noble scale, whether a tragedy or an epic, and he made a list of nearly a hundred possible subjects, chosen from sacred and early English history. At the head of this were four entries which show that the theme of 'Paradise Lost,' to be treated in the form of a Greek tragedy, was then uppermost in his mind. There were also two entries dealing with the story of Samson, one of which later bore fruit in 'Samson Agonistes.' But the times were not propitious to poetical composition, and for nearly 20 years Milton wrote only occasional sonnets and scraps of verse, besides some rather astonishingly doggerel versions of Psalms. In 1645, however, he collected his somewhat scanty tale of English and Latin poems into a volume, which was published by Humphrey Moseley, the Tonson or the Moxon of the day. It seems to have made much less impression on readers than the collection of Waller's poems issued the same year. He also worked upon tasks in keeping with his duties as schoolmaster, such as his 'History of Britain,' to the Norman conquest, not published until 1670, and, probably, his 'Accidence commens' Grammar' (1669) and 'Artis Logicae Plenior Institutio ad P. Remi Methodum concinnata' (1670).

His prose writings practically began in the summer of 1641 with his 'Of Reformation Touching Church Discipline in England.' Attacks had been made in the Long Parliament upon the episcopal system, and the Bishop of Exeter (later of Norwich), Joseph Hall (q. v.), long since famous as a satirist, had published

a defense of his order and a remonstrance to Parliament, which had drawn forth a reply from five Puritan divines under the pen-name 'Smectymnuus' formed from their initials. The 't' and the 'y' of this uncouth compound were furnished by Milton's former tutor, Thomas Young, who is probably responsible for his pupil's throwing himself into the fray. Hall replied to 'Smectymnuus' and secured the support of the learned Archbishop Usher (q. v.), and the five Puritans vindicated themselves. Milton's was the sixth pamphlet of the series and between May 1641 and April 1642 he contributed four others — 'Prelatical Episcopacy' (June 1641, a reply to Usher); 'Animadversions upon the Remonstrant's Defense against Smectymnuus' (July 1641, a bitter, point by point answer to Hall's reply to 'Smectymnuus'); 'The Reason of Church-government urged against Prelaty' (about February 1641-42, his most weighty and dignified argument against the episcopal system); and 'Apology against a Pamphlet called A Modest Confutation of Animadversions upon the Remonstrant against Smectymnuus' (March 1641-42, a reply to the pamphlet, whose title is included in his own title, which was apparently the work of Hall and his son, and was certainly a personal attack, the grossness of which largely extenuated the fierceness of Milton's retort).

Of these five anti-prelatical tracts, none of which is of great length, the first and third have most value in themselves, because they have a broad basis in history, philosophy, and theology, and thus afford proofs of Milton's learning and of his powers as an idealistic controversialist. The three others too frequently give unpleasant evidence that Milton was an almost unrivalled master of personal invective. The chief value of the entire series lies in the fact that they contain much nobly conceived and expressed autobiographical information, as well as some of the most sonorously harmonious prose to be found in any literature — for example, the closing paragraphs of the first tract. In general, their cumbersome style, their involved arguments, and their antiquated subject-matter make them difficult reading to all save professed Miltonians; but, when their many merits are duly weighed and the standards of 17th century controversy are borne in mind, it seems scarcely an exaggeration to say that they combine with Milton's other works in prose and verse to give his fame a broader foundation than is probably possessed by any other English writer.

The pamphleteer and poet appears to have determined deliberately that he could do his country more good by writing on subjects of public concern than by entering the army. It was doubtless a wise decision. This can hardly be said of his resolve to marry. In the spring of 1643 he took a mysterious journey into Oxfordshire — possibly to collect a debt owed him by a cavalier named Richard Powell. A few weeks later he returned to London with this gentleman's 17-year-old daughter Mary as his bride. Of the wooing and the reasons for the marriage nothing is known. The bride is said to have remained with Milton a month and then, finding her life dull, to have gone back to her father with the promise that she would return to her husband by the end of September. She failed to keep her promise and Milton sent a

messenger for her, who was unpleasantly treated by her family. Then the irate husband declared he would never receive her, and wrote his first tract on divorce. Such is the story given by Edward Phillips. There is an extant copy of the divorce tract, however, which is marked 1 Aug. 1643—and, unless this is a mistake, we are forced to believe that Milton was pleading for liberty to break the chains of matrimony at a time when, according to precedent, he should have regarded them as strings of roses. Such an idealist might have expressed such views without reference to his own experiences and desires, but it is hard to divest one's self of the belief that in this instance the wish was the father of the theory. It is almost certain that, whether or not there was between the pair a suddenly discovered incompatibility of temperament, each had reason to regret the alliance, Milton because he had too young and flighty a partner, his wife because her Puritan husband, twice as old as herself, was too serious and self-absorbed. In the absence of evidence it is idle to discuss the suggestion that the bride resolved to be one in name only.

In 'The Doctrine and Discipline of Divorce Restored, to the Good of Both Sexes,' Milton took the advanced stand that "obstinate incompatibility of mind or temper between husband and wife is as lawful a ground for divorce as infidelity" (Masson). He argued with his usual idealistic fervor and showed plainly that no man could have a higher conception of true marriage than he; but he was singularly blind to the weight of the sociological objections to his theory. His views naturally met with adverse criticism and he expanded them in a second edition under his own name (Feb. 1643-44). In July 1644 he published a less interesting, but far from feeble, tract entitled 'The Judgment of Martin Bucer on Divorce.' Then he was denounced before Parliament, which decreed that a licensing ordinance be prepared and that Milton and his printers be sought for. Nothing further happened, so far as the bold pamphleteer was concerned, save that later he came near being examined by the House of Lords, and that he was given the occasion to write the best known and most uniformly excellent of his prose works, his eloquent 'Areopagitica, or Speech for the Liberty of Unlicensed Printing' (Nov. 1644). It is needless to say that the Parliament he addressed so boldly with arguments, not absolutely liberal, but far in advance of his times, had no opportunity to listen to Milton's own voice, which, however, in a metaphorical sense has since echoed in every legislative hall of every free people. It is probable that he had friends in Parliament who blocked the measures taken to call him to account, and that in a less turbulent period he might have paid dearly for his rashness. As it was, he had the dubious honor of having a group of adherents named after him, and he published without molestation two more tracts on divorce—'Tetrachordon, or Expositions upon the four chief places in Scripture which treat of marriage' (March 1644-45), and 'Colasterion: a Reply to a Nameless Answer Against the Doctrine and Discipline of Divorce,' (March 1644-45). The temper displayed in the latter pamphlet was not calculated to allay the hostile criticism that assailed him, nor was the rumor that he was courting the at-

tractive daughter of a Dr. Davis particularly to his credit. This rumor and the financial distress of her royalist family seem to have brought Mrs. Milton to terms. She suddenly appeared before her husband while he was visiting at a neighbor's, begged his pardon, and was taken back.

The united couple took a larger house in the Barbican, and the school was somewhat enlarged. Between July 1646 and May 1652 three daughters and a son were born to them, the boy dying in infancy. The mother died not long after the birth of her last child. Meanwhile her father and mother, with some of their children, had been obliged to live with Milton, and money troubles had arisen, scarcely to be wondered at. Another house had also been taken—in High Holborn—and the school had been given up.

During these years Milton seems to have grown as radical in his ecclesiastical and political views as he apparently was in his educational theories and in his domestic economy. He sympathized with the army against the Parliament, with the Independents against the Presbyterians, and was one of the first to approve the execution of Charles I. His loosely reasoned 'Tenure of Kings and Magistrates' appeared within two weeks of that event and was probably the cause of his speedy appointment as Latin Secretary to the Council of State at a salary of about £290 (March 1649-50). His main task was the translation of despatches intended for foreign governments, but he had also to answer attacks made on the home government, and, ironically enough, to act as a sort of censor of the press. He was given official apartments in Scotland Yard, was expected to be present at audiences of foreign envoys, in short, held a post of considerable dignity and importance.

The first of his official publications was his 'Observations' on the Articles of Peace between Ormonde and the Irish rebels (May 1649). The second was 'Eikonoklastes,' a point for point answer to the popular 'Eikon Basilike,' supposed to be the last meditations of Charles I., but really, it would seem, the work of John Gauden (q. v.). Milton's answer, which appeared in October 1649, is perhaps the strongest of his controversial pamphlets, but it is now mainly known for its exposure of a plagiarism by Gauden from Sidney's 'Arcadia' and for the over-emphasized evidence it affords of Milton's increasing Puritanism in matters of taste. Another answer to a more important book was the 'Defensio Pro Populo Anglicano,' published in or about March 1650 to counteract the effect produced by the 'Defensio Regia pro Carolo I.,' which the learned Salmasius (Claude de Saumaise, professor at Leyden) had written at the instigation of Charles II. Milton's book gave him a continental reputation, for it was generally felt that he had shown himself to be a match for Salmasius (q. v.) as a writer of Latin, and more than a match as a scurrilous controversialist. Such a reputation was, however, but a slight recompense for the loss of his sight, which was partly due to his persisting to labor on this book as a patriotic task despite the warnings of his physicians. The glaucoma, from which he seems to have suffered, would probably have ended in blindness in any event, but the sublimity of the poet's patriotic self-sacrifice is scarcely lessened by this fact.

Milton's next book was his 'Defensio Secunda' (May 1654), a reply to an invective by Peter Du Moulin which had been edited by a professor in Holland, one Alexander Mornus or More, "a Frenchman of Scottish descent." Milton mistook the editor for the writer and overwhelmed him with abuse, not disdaining to rake up charges of sexual misconduct. Mornus naturally but unluckily attempted a reply and was again violently assailed by Milton in his 'Pro Se Defensio' (August 1655). Even the most devoted Miltonian must regret the writing of these gross tracts, although the former does contain interesting passages illustrative of its author's life and political ideals.

Meanwhile Milton at the close of 1651 had removed to a house in Petty France, Westminster. By the middle of 1652 he was wholly blind, but he continued with the help of assistants to do the work of his office at a reduced salary. The most important despatches, such as those of Cromwell protesting against the persecution of the *Quakers*, were still intrusted to him. On 12 Nov. 1656 he married his second wife, Katherine Woodcock, who died 15 months later in childbirth. Milton wrote in her memory a fine sonnet, imitated from an Italian one, but beyond this testimony to her worth little is known of her. We are equally ignorant of the way his house—with a blind father and three small daughters—was conducted during his two periods of widowhood. He had a small circle of friends, including two of his old pupils, Cyriac Skinner and Henry Lawrence, Lady Ranelagh, and Andrew Marvell (q. v.), the last named of whom from 1657 to 1660 assisted him in his duties as secretary. Toward the close of the Protectorate his literary work declined to the writing of a few sonnets and the publication of two or three ecclesiastical and political pamphlets, which are important chiefly as showing that he resisted steadfastly the drift toward monarchy and an established church. It is pathetic to find him at the end of Richard Cromwell's short régime willing to preserve republicanism in name only provided liberty of conscience could be secured. His projects were chimerical and were much ridiculed, the nobility of his idealism making but a slight appeal in such tumultuous times. The dashing of his hopes as a reformer probably led his thoughts back, however, to the channel from which they had been diverted throughout the period of strife. From about 1658 he seems to have meditated an epic poem on the theme of 'Paradise Lost.' The Stuarts were restored to their kingdom and Milton to his; but, while we may be grateful for this, we need scarcely, with Mark Pattison, view Milton's controversial period as so many lost years. It seems better to agree with Dr. Garnett that 'Paradise Lost' would not be the poem it is if Milton had not been allowed to develop his powers through his contact with men and affairs.

At the Restoration Milton went into hiding in a friend's house. Two of his books were burned by the hangman, but in some unexplained way, partly no doubt through the influence of Marvell, he was not exempted from the benefits of the Act of Indemnity (29 Aug. 1660). Later he was arrested, but he was soon released and he had influence enough to protest vigorously against being required to pay excessive fees to

the sergeant-at-arms of the House of Commons. His immunity from punishment caused much comment, and stories like that of a mock funeral and that of the intervention of Sir William D'Avenant (q. v.) in return for a previous similar intervention by Milton, were probably invented to account for what seemed to be an extraordinary case of leniency or of forgetfulness. When he was out of danger, Milton took a house in Holborn and then in Jewin street. The loss of his salary and of some investments doubtless forced him to lower his scale of living and also prompted him to look out for a third wife who would manage his home better than his eldest daughter did. In February 1662-63 he married Elizabeth Minshull, who seems to have made his last years comfortable in a house in Artillery Walk, Bunhill Fields.

Not long after this last marriage he appears to have finished 'Paradise Lost' and, with some trouble, to have secured a license for it from Thomas Tomkyns, chaplain to the Archbishop of Canterbury. During the plague of 1665 he retired to Chalfont St. Giles in Buckinghamshire, and there he loaned his Quaker friend, Thomas Ellwood (q. v.), the complete manuscript of the great epic. Ellwood on returning it made the famous remark which led to the writing of 'Paradise Regained': "Thou hast said much here of Paradise Lost, but what hast thou to say of Paradise Found?" It was not until April 1667, partly, perhaps, in consequence of the fire of 1666, that Milton secured a publisher for 'Paradise Lost.' Then he signed a contract with Samuel Symmons by which the latter was to pay £5 down and £5 more on the sale of each of the first three editions, which were not to exceed 1,500 copies apiece. This is usually referred to as a hard bargain, but in view of Milton's unpopularity, the length and theme of his poem, and his innovation in the use of blank verse, it seems unfair to blame Symmons. It is equally unfair to Milton's contemporaries to maintain that Addison's criticisms in 'The Spectator' first showed Englishmen that they possessed an epic poet worthy to rank with Homer and Virgil. Six editions had been published before the close of the 17th century, an elaborate Latin commentary had been written upon it, and Dryden and Marvell had extolled it. The religious nature of its theme has always, of course, given it a standing somewhat independent of its consummate poetic merits; but these, especially its sublimity and its unrivalled harmonies, have rarely been denied by competent critics of any nationality, and efforts to show Milton's excessive indebtedness to other poets, such as Andreini and Vondel, have not met with great success. That 'Paradise Lost' is a popular poem or Milton a poet whose genius is ungrudgingly acknowledged by all cannot be maintained; but the supreme and isolated greatness of both seems likely to escape serious challenge. When 'Paradise Regained' was finished and when 'Samson Agonistes' was written cannot be accurately determined. They appeared in one volume in 1671, and probably represent Milton's last creative literary labors. It is said that he could not bear to have 'Paradise Regained' pronounced inferior to 'Paradise Lost,' a fact, if fact it be, which has been twisted into the statement that he preferred the

poem which the public most systematically neglects. This is scarcely credible since the theme, scope, and style of the two poems are so different as to render comparison rather meaningless save with regard to interest and to the level kept by the poet's imagination, points in which the superiority of 'Paradise Lost' is manifest. On the other hand, 'Paradise Regained' in its poised nobility and its artistic use of the materials furnished by the Gospel narratives of the Temptation is so perfect of its kind that Milton's indignation at hearing it undervalued is easily comprehended. 'Samson Agonistes' has fared better at the hands of critics and readers. It is probably the most successful tragedy of the Greek type ever written by an English, if not a modern, poet, and it is certainly full of the unquenchable spirit of its author. Samson blind, in the midst of his enemies, the victim of his own infatuation for a woman, was a hero with whom Milton, of all men, could thoroughly sympathize.

The poet's health was now undermined by the gout, and he devoted his closing years to setting his miscellaneous writings before the world in a proper shape. Besides the academic publications already mentioned, he revised his early poems in 1673, adding to them a few youthful pieces and some of his later sonnets, and the next year he collected his Familiar Epistles, with his College Exercises. On 8 Nov. 1674 he died peacefully, and four days later he was buried in Saint Giles, Cripplegate, beside his father. It may be inferred that some of the obloquy once heaped upon him had been dissipated, since his funeral was well attended. His daughters, who had not made his life pleasant, and whom he had employed as readers in languages they could not understand, and had not educated or perhaps appreciated as a schoolmaster and man of such refinement might have been expected to do, disputed with his widow the terms of his nuncupative will, but the matter was finally compromised. The widow survived till 1727, a date at which all trace of the poet's descendants through certain Clarks in India seems to have been lost. The granddaughter for whose benefit 'Comus' was performed in 1750 had buried her seven children in infancy. Nor was the poet's progeny short-lived only; it appears to have sunk decidedly in the social scale.

From the portraits and descriptions of Milton it may be gathered that he was somewhat short and well made, with light hair and clear-cut features. He was stately in his manners, dressed neatly, was temperate and methodical in his habits, which were those of the student rather than of the artist, although he kept up his music to the end of his life. He was on pleasant terms with a small group of friends, and was accessible to foreigners of distinction. He took regular exercise and indulged in an occasional pipe. Perhaps his only striking eccentricity—for in such an age of confusion his religious and political radicalism should not excite surprise—was his adoption of the notion that his creative genius worked freely only from the "Autumnal Equinoctial to the Vernal." It is at least fairly certain that his poetical powers were not so distinguished for affluence as for felicity and strength. When he was in the mood for composing (in his latter years) he seems to

have stored up passages in his memory and to have dictated them by batches of 20 and 30 lines to any chance amanuensis he could secure.

Milton's position in English literature, as settled by popular consent, would seem to be not far below Shakespeare and well above all other authors. He has had and has adverse critics, however, while a few persons would place him at least on an equality with Shakespeare in greatness. As a conscious poet artist he has not been clearly surpassed in the literature of the world; he is doubtless the consummate master of the sublime; and he has few equals as a writer of erudite and sonorous prose. As an exponent of idealism in conduct he is almost as memorable as he is in his function of poet; as an inspired and inspiring patriot of liberal mould he is practically unparalleled. In total range of appeal as poet, scholar, patriot, and man his closest students are seldom willing to admit his inferiority to any other mortal.

The titles and dates of the main works published by Milton during his life have already been given. To these should be added, as posthumous publications, a surreptitious collection of 'Letters of State' (1676, translated by Phillips, 1694); 'A Brief History of Moscovia' (1682), and 'J. Miltoni Angli de Doctrina Christiana Libri duo posthumæ' (edited by Sumner, 1825). This treatise on 'Christian Doctrine,' the manuscript of which went through curious adventures, gives formal justification to the idea that Milton developed a sort of semi-Arianism, traces of which have been discerned in 'Paradise Lost.' Milton's 'Commonplace Book,' edited in 1876 and 1877 (for the Camden Society), seems to include nothing original. The MSS. now in the library of Trinity College, Cambridge, which contain the lists of subjects for a long poem and copies of several early poems, including 'Comus' and 'Lycidas,' were published in facsimile in 1899. Several productions have been attributed to Milton on but slight grounds, the latest being a romance in Latin, 'Novæ Solymæ Libri Sex' (1648), resuscitated by the Rev. Walter Begley and translated and published by him in 1902. Mr. Begley's defense of his attribution of the romance to Milton may be found in his long introduction and his appendices; for a good destructive criticism of his arguments see an article by Prof. W. A. Neilson in 'Modern Philology,' April 1904.

Bibliography.—Among the most important editions of Milton's poetical works are those of Newton (1749-52), Todd (1801, 1809), Sir Edgerton Brydges (1833), R. C. Browne (1870—the English Poems), Masson (1874, 1877, 1880), Bradshaw (1892—the New Aldine), W. V. Moody (1899), H. C. Beeching (1900), and W. Aldis Wright (1903). The Aldine edition of 1832, with a life by John Mitford, should also be mentioned, as well as Bentley's curious edition of 'Paradise Lost' (1732), and Thomas Warton's excellent edition of the so-called Minor Poems (1785, 1791). Editions of separate poems, especially for school purposes, are very numerous. Of the prose works the following editions may be noted:—Of John Toland (1698), T. Birch (1738), T. Birch and R. Barron (1753), C. Symmons (1806), R. Fletcher (1833), R. W. Griswold (1847), J. A. St. John (Bohn's Standard Library, 5 vols. 1848-1853, including the 'Christian Doctrine'), J. Mitford

MILTON—MILWAUKEE

(1851, 8 vols., including the Poems, but not the 'Christian Doctrine'). There is no thoroughly good modern edition of the complete works. There are concordances to the Poems by C. D. Cleveland (1867), and John Bradshaw (1894).

The standard biography of Milton is the monumental work of Professor Masson (6 vols., 1859-80). Most of the editions mentioned above contain memoirs, which in some cases are very elaborate, e. g., that by Mitford in the edition of 1851. Of the early memoirs, that by Milton's nephew, Edward Phillips, was prefixed to his translation of the Letters of State (1694), and that by Toland to his edition of the prose works (1698). Later lives are by Thomas Keightley (1855), Alfred Stern ('Milton und Seine Zeit,' 1877-9), Mark Pattison (1879, in the English Men of Letters), Stopford Brooke (1879, in Classical Writers), and Richard Garnett (1890, in Great Writers, with a bibliography). Dr. Johnson's famous life in the 'Lives of the Poets' influenced public opinion against Milton until the tables were somewhat turned by Macaulay's enthusiastic essay in the 'Edinburgh Review' (1825). The number of essays and monographs and books dealing with special topics connected with Milton's life and works is, of course, very large, e. g., 'Milton's Prosody' (1893, 1901), by the poet Robert Bridges, and Edmundson's 'Milton and Vondel' (1885). Important critical discussions of moderate length may be found in the collected works of Matthew Arnold, Walter Bagehot, the elder William E. Channing, S. T. Coleridge, De Quincey, Emerson, Lowell, and Macaulay. To these critics may be added Augustine Birrell, Edward Dowden, Edmund Scherer, and Sir Leslie Stephen. Recent volumes dealing with the poet are Hiram Corson's 'Introduction to the Works of Milton' (1899), W. P. Trent's 'John Milton: a Short Study of his Life and Works' (1899), and Walter Raleigh's 'Milton' (1900). The chief histories of English literature, such as Taine's and that by Garnett and Gosse, as well as Saintsbury's 'Elizabethan Literature,' should also be consulted. An excellent edition of Johnson's life, the merits of which should not be underrated, is now provided in Dr. Birkbeck Hill's edition of the 'Lives of the Poets,' in three volumes (1905). WILLIAM P. TRENT, *Professor of Literature, Columbia University.*

Milton, Fla., town, county-seat of Santa Rosa County; at the head of Blackwater Bay, which opens into Pensacola Bay, and on the Louisville & Nashville railroad; about 18 miles north by east of Pensacola. The industries of the town are chiefly connected with ship-building and lumbering. It is the seat of Santa Rosa Academy and it has a public library which contains about 5,500 volumes. Pop. (1910) 831.

Milton, Mass., town in Norfolk County; on the Neponset River, and on the New York, N. H. & H. railroad; about six miles south of Boston. The first permanent settlement was made in 1637, but Milton was at first a part of Dochester; it became a separate town in 1664. Within the town limits are the villages of East Milton, Blue Hill, Matapan, and Lower Mills. The chief industrial establishments are the chocolate factory, which has 500 employees; the paper factory, 100 employees; the bakeries

100 employees; and in the granite works about 400 employees. Other industries are connected with manufacturing crackers, cement, rubber goods, and the raising and marketing of garden stuff. Milton is a residential suburb of Boston and the seat of the Milton Academy. The town has one public library, the Milton Convalescent Home, the Leopold Morse Home, and seven fine church edifices. It has also a station of the United States Meteorological Bureau and an Observatory located on the crest of Blue Hills. The one bank has a capital of \$100,000, and its business amounts to about \$700,000. The town is governed by town meetings. It has been the home of two colonial governors of Massachusetts; one Thomas Hutchinson, the historian, the other Jonathan Belcher, who was also colonial governor of New Jersey. Pop. (1890) 4,278; (1900) 6,578; (1910) 7,924. Consult Teale, 'History of Milton, Mass.'

F. A. LOWELL,
Editor 'Milton Leader.'

Milton, Pa., borough in Northumberland County; on the Susquehanna River and the Pennsylvania Canal, and on the Philadelphia & Reading and Philadelphia & Erie division of the Pennsylvania R.R.'s; about 66 miles north of Harrisburg. It was settled in 1768 by Marcus Hulings, and laid out in 1792 by Andrew Straub. It was incorporated as a borough in 1816. Milton is a manufacturing place; the chief industrial establishments are car works, which have 525 employees; iron mills, with 950 employees; machine-shops, 175; knitting and spinning mills, 320; bamboo furniture factories, 80; nail mill, 100; and other manufactories employing about 450 persons. The industries are all of home development; the report of the factory inspector shows that Milton has the largest per cent of population wage earners in the State. There are 11 churches and good public schools. The three banks have a combined capital of \$400,000. The government is vested in a burgess and a council of 15 members elected for three years. About 90 per cent of the population are Americans. Pop. (1900) 6,175; (1910) 7,460.

WM. P. HASTINGS,
Editor 'Evening Standard.'

Milton College, in Milton, Wis., a coeducational institution, founded in 1844 by the Seventh Day Adventists as Du Lac Academy; in 1848 the name was changed to Milton Academy, and in 1867 it was incorporated as a college. In 1910 there were reported 14 professors and instructors; 147 students; about 7,425 volumes in the library; grounds, buildings, and apparatus valued at \$36,000, productive funds, \$135,000; total income about \$16,800 per year. In 1910 the benefactions were nearly \$3,000. The number of graduates was (1910) about 350.

Milwaukee, mil-wā'ke, Wis., capital of Milwaukee County and the metropolis of the State; on the west shore of Lake Michigan, at the confluence of three rivers—Milwaukee, Menomonee and Kinnickinnic. The converging streams flow into a bay of great natural beauty, which extends nearly three miles inland and affords excellent harborage for vessels within the shelter of two miles of breakwater constructed by the Federal government.

MILWAUKEE

Topography.—A distance of six miles separates the high north and south headlands that mark the extremes of the bay. The intervening shore, except around the deltas formed by the disambiguating streams, is a series of bold bluffs that overlook the harbor from an altitude varying from 85 to nearly 300 feet above Lake Michigan, thence sloping gradually to the lower levels of the rivers that enter the city from the north, south and west respectively. The river bottoms were, half a century ago, stretches of wild-rice marshes and tamarack swamps, but the leveling processes prompted by business necessities have transformed them into solid ground whereon the chief business section has been built. The residence districts are located on the higher altitudes above the three valleys formed by the streams that trisect the city.

Trade and Industries.—Its harbor facilities have made Milwaukee a manufacturing city chiefly. All of the rivers being navigable, and the present channels supplying a dockage of 25 miles available to vessels, hundreds of manufacturing establishments are located on the upper reaches of the streams, with slips for additional vessel facilities. The Milwaukee and Menomonee rivers are each provided with turning basins that can be used by the largest lake vessels, and a large turning basin in the Kinnickinnic River, a mile from the harbor entrance, will soon be constructed. The deepest draft vessels can navigate the rivers and canals. The fleets of six independent steamship lines, and a fleet of car-ferries that is operated uninterruptedly all the year, furnish the water transportation to Milwaukee manufacturers. Iron and copper ore and lumber from the Great Lakes districts, and coal from the mines of the Middle States are thus transported cheaply. Three great railroad systems and their connections supply rail transportation facilities. The chief industries of the city, in the order of their importance as regards annual product, are these: Metal, \$79,776,837; clothing, \$26,763,376; leather, \$24,233,307; beer, \$20,730,200; other industries, \$78,810,642. From 1880 to 1890 the total product of the city's industries increased 147 per cent. From 1890 to 1900, 28.6 per cent; 1904 to 1909, 16 per cent. The manufacturing statistics in 1909 were as follows: Persons employed, 67,461; paid in wages, \$40,842,000; capital employed, \$219,391,000; value of products, \$208,324,000; the value of products increased 51 per cent from 1904 to 1909; wages, 53 per cent; cost of materials, 69 per cent.

Population.—Within the city's corporate limits are comprised 23½ square miles, a smaller area than that of any other city of considerable population in the United States. The first enumeration, in 1838, revealed a population of 700, which had increased to 9,666 by the date of the incorporation of the city in February, 1845. The number of inhabitants according to the Federal census of 1900 was 285,370. During the next decade (1910) it increased to 373,587. The great bulk of the residents are workmen, and it is estimated that fully 80 per cent of them own their own homes. Local banking statistics show that in the seven savings deposit institutions 35,570 wage earners have aggregate deposits of \$10,517,123. This is an increase of 74.52 per cent in the number of depositors and of 93.65 in the aggregate deposits in a period of five years. There has been no considerable

strike in Milwaukee since the general labor disturbance of 1885, except a walk-out of street car employees in 1896. The population of the city is polyglot. A map of the city with division lines determined by the predominating nationalities inhabiting certain districts would bear much resemblance to that of Europe as to nomenclature. For many years the population was largely of German birth, and Milwaukee acquired the title of the "German Athens of America." The first German settlers came in 1838, but it was not until 1845 that large numbers of Germans began to make the young city their home. For nearly half a century their customs found expression in the chief social life of the city. At one time the number of daily newspapers printed in German was nearly twice the number printed in the English language. A theatre was built expressly for performances in German, with stock companies drawn from Germany. A German market hall was constructed. Six turner halls were erected, and a seminary for students of physical training was established. During the Civil War, one company of volunteers was composed wholly of German turners. German instruction has been part of the daily programme in every public school since 1857. The tide of German immigration was followed, beginning 30 years ago, by a stream of Poles, Dutch, Scandinavians and Bohemians, and more recently Italians and Syrians have established colonies in certain sections of the city. The preponderance of German population has now disappeared, although certain wards remain solidly German, and a German theatre, a German market place, flourishing organizations of turners, German musical societies, and places of amusement and recreation distinctively German attest the perpetuity of customs brought from the fatherland. The foreign-born inhabitants are grouped in various sections of the city. German, Polish, Bohemian and Scandinavian papers and periodicals are published in Milwaukee, including two dailies in the Polish and two in the German language. The first Polish daily paper established in the United States was printed here.

Churches.—In 82 of the 162 churches, sermons are preached in foreign languages, including German, Polish, Dutch, Scandinavian, Welsh, Bohemian, Russian and Italian. The seat of a Catholic archbishopric and of a Protestant Episcopal bishopric are located in Milwaukee. The 162 churches are distributed among the following faiths and creeds: Adventist, 1; Baptist, 9; Catholic, 31; Christian, 1; Christian Science, 4; Congregational, 8; Episcopal, 12; Evangelical, 7; Evangelical Association, 6; Jewish, 6; Lutheran, 38; Free Methodist, 2; Methodist Episcopal, 18; Mormon, 1; Presbyterian, 11; Reformed, 2; Spiritualistic, 2; Unitarian, 1; Theosophist, 1; Salvation Army barracks, 1; People's pulpit, 1. The property of the religious organizations is valued by the tax commissioner's department at \$6,411,040. Some of the church edifices are architecturally beautiful, notably Saint Paul's Church, in the Norman style; Saint Josaphat's, Byzantine; Gesu, Immanuel and Saint James, Gothic. The convent of Notre Dame, which occupies a square in the heart of the city, is the mother house of the Order in the United States. In the suburb of St. Francis, the Catholic seminary of Pio Nono is surrounded by a magnificent tract

MILWAUKEE

of 200 acres. Marquette College (Catholic) and Concordia College (Lutheran) are located on the West Side.

Government.—The elective city officers are a mayor, treasurer, comptroller, attorney and a common council consisting of two aldermen from each of the 23 wards, chosen biennially. The administrative functions are vested in appointive boards whose titles indicate their duties: Board of school directors (23), board of public works (4), public debt (3), city service commission (4), fire and police commission (4), school commission (4), public library board (9), public museum board (9), park board (5), emergency hospital board (9). All of the boards and commissions with a membership of four are required by law to be bi-partisan. Certain features of their administration and organization are peculiar to Milwaukee. The total number of persons in city service is 3,111, and 2,923 of these are under civil service rules with tenure of office during good behavior, leaving but 188 persons, including elective and honorary officers, not subject to such rules. The city service employees affected by city service laws are in the following departments: Under the board of city service commissioners, 1,312; under the board of fire and police commissioners, 659; under the board of school directors, 952. The firemen and policemen were prior to 1885, when a bi-partisan board was created, removable for political causes; the official and labor service was placed within the shelter of a bi-partisan board's rulings in 1895; the school department has not been affected by politics since 1897. The school board organization is peculiar to Milwaukee. The school commission is bi-partisan, the mayor appointing one member of the four annually. Their sole duty is to select one third the membership of the board of school directors annually on a strictly non-partisan basis. The library and public museum boards are composed of three aldermen and six "citizen members" each, the library board electing its members as terms expire, except the aldermanic contingent, whom the mayor appoints.

Public Works.—Some advanced theories in municipal ownership and administration have found a footing. The waterworks property, valued at \$5,154,617, is owned by the city, the entire cost of construction and maintenance having been paid out of its proceeds, and its large surplus revenues now aid in defraying other municipal expenditures. A crematory for consuming garbage, which is collected by the health department, is also owned by the city. A free emergency hospital, originally a private benefaction, is maintained at public expense, likewise three large natatoriums all the year through, and in the summer free public bath houses on the lake beach and swimming schools on the upper Milwaukee River. In many of the public parks, of which there are 21, partly with boulevard connections, free public concerts are given semi-weekly. The total acreage of these parks is 571. Ten of them vary from 20 to 150 acres in extent, the others being small breathing spots distributed in various parts of the city. During six winter months, free public evening lectures for adults are given in public school halls, the expense being borne by the school fund. The city owns exposition grounds, though the building located upon them is the property of a

quasi-private corporation. A city-hall was completed in 1896 at a cost of \$1,200,000, and a library and museum building is valued at \$1,168,000, with contents. The library comprises 150,000 volumes. There are 239,291 specimens in the museum, including a remarkable collection of 5,244 different kinds of birds' eggs and nests, and of 2,529 arms and military accoutrements representing all nations and eras. Among the notable public works is a flushing tunnel connecting the Milwaukee River with the Lake, water being pumped from the Lake into the stream in such quantities (17,412,735,371 gallons last year) as to cleanse the channel whenever required to prevent offensive conditions. A system of intercepting sewers paralleling the streams has been partly constructed.

Education.—There are 54 public schools, including a school for the deaf-mutes and four high schools. The total enrolment is 36,000. A State Normal school, with an enrolment of 300 students, is the main source of supply for the teaching corps. Every primary and district school in the city, with two exceptions, has a kindergarten department, Milwaukee having been the pioneer city in the United States, a quarter of a century ago, to institute kindergarten instruction as part of the regular work in every school building below the high school grade. There are 71 parochial and private schools with a total enrolment of nearly 22,000. In addition to the institutions heretofore mentioned, the Milwaukee-Downer College for young women is located here, in a group of buildings recently completed in the northern suburban district near Lake Michigan. Part of its endowment is obtained from an organization of 600 women known as the College Endowment Association, who conduct annually series of University Extension lectures for their own members in the Athenaeum building. The Athenaeum is owned by the Woman's Club, was built by them and is maintained as a successful business venture by them. The Layton Art Gallery, managed through a board of trustees, is open to the public without admission charge, and is the gift of Frederick Layton. The Johnston Emergency Hospital building was given to the city by John Johnston.

History.—The first permanent settlement of Milwaukee is usually dated from 1818, when Solomon Juneau erected his little log cabin on the east side of the Milwaukee River. French and English traders had been here before that date, and a procession of Jesuit priests and French voyageurs had preceded them. The first recorded visit of a white man on the site of the future city is in the journal of Father Zenobe Membré, a Recollet missionary priest who accompanied Robert Cavalier de la Salle on his memorable exploratory trip from Lake Erie to the Illinois country in 1679. He notes that both Mascoutens and Foxes were dwellers "on the banks of the river called Melleoki." John François Buisson de Saint Cosme journeyed in 1699 along the west shore of Lake Michigan from Michilimackinac to the Mississippi. "On the seventh," he wrote, "we arrived at Melwarik (Milwaukee). This is a river where there is a village which has been considerable and inhabited by the Mascoutens and Foxes, and even some Pottawattamias." The word Melleoki and its numerous variants which by a process of evolu-

tion has become Milwaukee, is of Pottawattami origin and signifies "good land." Another definition accepted by some historians is "council place," this having been regarded as neutral territory by different tribes of Indians. The dwellers in the old Indian village were evidently a turbulent set, for Colonel Arent de Peyster, commandant at Michilimackinac, wrote of them in the early years of the Revolutionary War as "runagates—a horrid set of refractory Indians." Lieutenant James Gorrell, whose British regulars occupied the stockade at Green Bay in 1762 and gave it the high-sounding title of Fort Edward Augustus, wrote the name of the place as "Milwacky." An English trader lived among the Indians at this place in that year. Fur traders made brief stays in the village from time to time. Alexander Laframboise and his brother were located as traders here in 1785, with a large stock of goods. In 1795 Jean Baptiste Mirandau, a Canadian blacksmith who had married an Indian woman, built a cabin and made himself useful to the Indians by mending their firearms. He received as compensation game and furs. He died in 1819, being survived by a family of 10 children, who joined the Indians when the Milwaukee band was removed. Thomas Gummersall Anderson, the son of a Loyalist, was a resident upon the site of the future city of Milwaukee from 1803 till 1806. He took an active part in the capture of Prairie du Chien by the British during the War of 1812. When Solomon Juneau arrived in 1818, he found a Pottawattami village. He settled on the east side of the Milwaukee River, which later was called Juneautown; the west side of the river became Kilbourn town, after Byron Kilbourn (1834), and George H. Walker gave the name of Walker's Point (1834) to the region south of the Menomonee River. Each of the three natural geographical divisions became the nucleus of a little community, and acrimonious rivalry was a natural resultant. The different names of streets on opposite sides of the rivers, now connected by 28 bridges, are a survival of the bitter feelings then engendered. The village of Milwaukee, now the East Side, was organized 27 Feb. 1837; Kilbourn town, now the West Side, was annexed 11 March 1839; and Walker's Point, now the South Side, 5 Feb. 1845. The city was incorporated 5 Feb. 1845, and Solomon Juneau chosen the first mayor.

HOWARD E. LAMSON,
Secretary Parkman Club.

Mime, a dramatic entertainment, native to Sicily and Magna Græcia, and appealing to popular taste by its scurrilous caricatures of low life. Originally performed in public squares on festival days, it was later developed into artistic form by Sophron Syracuse in the fifth century B.C. The newly discovered *Mimiambi* of Herondas (q.v.), a Greek poet of perhaps the latter half of the third century B.C., representing the every-day life of the common people, give us probably a trustworthy idea of these literary mimes. The Romans adopted the mime in its unliterary form as early as the third century B.C., but it was not until Cicero's time that it received a place in literature at the hands of Decimus Laberius and Pubilius Syrus, of whose works we have fragments. As an after-piece, and under the Empire as an independent performance, it was as popular as it was indecent in words and action.

Mimicry, in Nature. Mimicry is a technical term in the language of the exponents of organic evolution (q.v.) to indicate the gradually assumed and unconscious resemblance of given animals to others, due to the fact that by such a disguise, or resemblance to the former in shape, color, markings, mode of motion or other characteristics, the latter secure certain advantages in the struggle for existence. Such a gradually assumed resemblance, regarded as the result of a process of natural selection, is called "mimicry" or "imitation," although of course it is wholly unintentional on the part of the creatures themselves. Many animals, particularly among the insects, are imitated, because by reason of an unpleasant taste or odor, or of their excessively hard shells, they are rejected by insectivorous birds, reptiles, and mammals. On this account they are generally adorned with gay colors or are luminous at night, to make themselves recognizable even at some distance; and such display themselves leisurely, boldly and openly, before all eyes. To them belong entire families,—for example, among butterflies the danais (q.v.) and heliconids, and among beetles the fireflies; which, accordingly, are imitated even in their frequently brilliant colors and markings by butterflies and beetles of other classes, whose kindred otherwise are subjected to a bitter persecution. Sometimes one particular prototype is followed by several imitators of wholly different classes, which associate themselves in a swarm with the former. Another category of animals often imitated is that of those provided with a formidable weapon, for example, wasps and ants, as well as individual poisonous snakes.

The phenomenon is most striking when animals of wholly different orders take part in the same imitations, for example, wasps and bees are imitated by butterflies, beetles, flies, orthopterans, and hemipterans, or ants by beetles, locusts and chinch-bugs. Poisonous snakes are not only mimicked by harmless snakes, but also by large caterpillars. In individual instances parasitic insects also appear to imitate their hosts, and then creep unrecognized into their nests; and even among plants it is believed that analogous phenomena can be demonstrated, for example, the imitation by so-called dead-nettles of the nettle avoided by cattle in pasture.

In an expanded sense, to mimicry is commonly assigned also the imitation of unrelish-

MIMIR — MIND READING

able, inanimate objects, as, for example, that of withered, gnawed and mold-covered leaves by butterflies or locusts, of bits of twig, particles of dung, cocoons whose contents are breaking out; or even the imitation, serving the mere purpose of concealment, of objects under and upon which an animal seeks refuge, for example, of green twigs and leaves, lichen-grown stones, barks, etc. This phase of the matter is coming to be more often distinguished, however, as "protective resemblance." A comprehension of the factors by which these imitations, frequently carried out to the most minute details and leading to the most complete deception, are produced, first became possible through Darwin's theory of natural selection; and above all it was the naturalists Bates and Fritz Müller who first furnished suitable explanations of the relations and processes concerned. It should be added, however, that the most recent study has discredited some of the conclusions of the earlier enthusiasts and has attributed many observed resemblances and parallelisms to other causes and influences.

Consult the writings of Fritz Müller, Darwin, Wallace, Bates, Belt, and the volumes of the 'Cambridge Natural History' (1895-1903).

Mimir, mē'mir, in Scandinavian mythology, the god of wisdom, and most celebrated of the giants.

Mimnermus, the earliest writer of Greek erotic elegy, was born in Colophon or Smyrna, and lived in the last half of the seventh century B.C. His collection of love-poems, called 'Nanno' from the name of a flute-player whom in his old age he courted in vain, survives only in fragments which may be read in a separate edition by N. Bach (Leipzig 1826) or in Bergk's *Poetae Lyrici Graeci*.

Mimosa, a genus of herbs, shrubs, trees, and a few climbing species of the natural order *Leguminosae*. The species, of which more than 200 have been described, are natives principally of the American tropics. They have pinnate leaves, usually spicate clusters of small flowers, followed by flat, oblong or linear pods which when ripe break into one-seeded joints. Many of the species are noted for their sensitive leaves which at nightfall close and droop. Others respond to a touch. Of these the humble or sensitive plant (*M. pudica*) is perhaps the best known.

Mina, an ancient Greek denomination of money. The Attic mina contained 100 drachmae, and was valued at about \$16.

Mina-bird, or **Myna**, a starling or grackle (*Eulabes religiosa*), very familiar throughout India and eastward, nestling confidently in gardens. Its color is a deep velvety black, with a white mark on the base of the quills of the wing. The bill and feet are yellow, and there are two yellow wattles on the back of the head. The Hindus regard it as sacred to Ram Deo. Certain other similar species are also called *myna* in some localities.

Mina'ana. See **SABANA**.

Min'aret (Arabic, *minarat*, a lantern), a tower generally surrounded with balconies, and erected in connection with the mosques in Mohammedan countries, from which the muezzin summons the people to prayer and announces the hours, bells not being used by the Moslems. See **Mosque**.

Minas, mē'nās, or **Bello Horizonte**, Brazil, the capital of the state of Minas Geraes, 60 miles northwest by rail of Ouro Preto, which it replaced as the administrative seat in 1894. It is a modern town with wide streets, electrically lighted, and adorned with handsome public buildings, elegant residences, and fine parks. Pop. 29,000.

Minas, Uruguay, the capital of the department of Minas, 56 miles by rail northeast of Montevideo. It carries on a trade in the produce of the surrounding agricultural region, and in the marble and granite of the neighboring quarries. Pop. 4,700.

Minas Geraes, mē'nās zhā'ris, Brazil, a southeastern state bounded north by Bahia, east by Bahia and Espirito Santo, south by Rio de Janeiro, and São Paulo, southwest by São Paulo, and west by Goyaz; area, estimated at 222,160 square miles. The surface is mostly mountainous, and though lying within the tropics its elevation renders the climate temperate and healthful; but the low tracts are periodically flooded, and contain extensive swamps and pools. It is rich in minerals, gold, silver, platinum, copper, lead, diamonds, rubies, and other precious stones being found. Extensive iron-works have been erected in the neighborhood of Ouro Preto. Sugarcane, cotton, millet, tobacco, and coffee are cultivated. The cultivation of cereals is extensive, and the finest European fruits have been introduced. Vast herds of cattle and swine feed in the pastures and forests. Timber and dye-woods of the most valuable kind, together with numerous varieties of gums, balsams, and medicinal plants, grow freely in the latter. Some trade in home manufactures, and an extensive foreign commerce, have been established. For administrative purposes Minas Geraes is divided into fourteen comarcas. It sends twenty members to the general assembly, and ten to the senate. The provincial assembly is composed of 36 members. It sits at Mipás (q.v.) since 1894 when the administrative seat was removed from Ouro Preto. Pop. about 3,300,000.

Minch, The, Scotland, the channel off the northwest coast between the mainland and the island of Lewis; it is above 30 miles wide, and on either side are numerous lochs or sea-arms penetrating inland. It is connected with the Sea of the Hebrides on the south by the Little Minch, the channel between the island of Skye and Long Island; its narrowest part is about 15 miles wide.

Mincio, min'chō, Italy, a river, the ancient Mincius, which flows from the south extremity of Lake Garda, near Peacheria, and after forming the lake and marshes that surround Mantua, falls into the Po eight miles below the city. Its banks are remarkably fertile, and celebrated for their beauty by Virgil, who was a native of this country. It formed an important base of operations in the wars between France and Austria. The length of its course is over 100 miles.

MINDANAO — MINDORO

Mindanao, mên-dâ-now', Philippines, the most southeastern and largest island of the archipelago, lying between lat. 5° 35' and 9° 50' N. and between lon. 121° 53' and 126° 28' E., northeast of Borneo. It is bounded on the east by the Pacific Ocean and on the west by the Sulu Sea; area 45,356 square miles; with its dependent islands 46,521 square miles.

Topography and Climate.—The outline of the island is very irregular, and the coast is uneven and much indented with deep bays and inlets; the shore line is 1,592 miles, and the width of the island from east to west 386 miles. The island is very mountainous particularly in the interior, the mountain system consisting of a number of irregular ranges extending generally north and south, and as a rule approaching near the coast. The mountain formation shows the effect of earthquake and volcanic action, and there are many volcanoes, some of which are active. The principal peaks are Apo (10,312 feet), near the southeastern coast, and Malindang (8,560 feet) in the northwest. The island is drained chiefly by two large rivers, the Grande de Mindanao (q.v.), flowing southwest and west, on the western side of the central mountain range, and the Butuan or Agusan, flowing northwest, on the eastern side of the same range. There are numerous other smaller streams and nine large mountain lakes. There are iron springs at Placer, in the province of Surigao; sulphur springs at Mainit, Surigao, and Balingasag, Misamis, and medicinal thermal springs at Malibato. As the island is within 10° of the equator, the climate is hot and humid, but more equable than that of Luzon; rains are frequent and heavy.

Forests and Fauna.—The island is covered with forests of valuable woods for ship- and house-building and furniture making; among these are the molave narra, (similar to the yellow pine), teak, ebony and cypress; the gum and resin producing trees and medicinal and dye plants also grow abundantly. Animal life is abundant in these forests; over 200 species of birds have been classified of which 17 species are peculiar to Mindanao and Basilan; deer, wild hogs, monkeys, and the haguang or colugo (q.v.) are numerous. Reptiles, including the giant lizard, iguana, and large snakes, particularly the boa, also infest the forests and crocodiles the river.

Industrial Resources.—The staple agricultural products are rice, sugar, cotton, corn, tobacco, indigo, coffee, and hemp; in 1899 Mindanao ranked fifth among the hemp-producing sections of the Philippines; other products of special value are cloves, nutmegs, cinnamon, and other spices, betel nuts and betel peppers. The most important industry is the cultivation and shipment of hemp, and forest products; large herds of cattle and horses are raised; and there is a little weaving of hemp and cotton fabrics for home use. Edible birds' nests are also gathered and exported. Communication is largely by water, as there are few roads except in the immediate vicinity of the chief towns, and the towns and villages are situated on the coast or on the large lakes and rivers. Gold is obtained in small quantities by the natives, and is doubtless abundant; coal, sulphur, copper and platinum are also reported.

People and Government.—Mindanao is peopled mostly by tribes of the Moro race, among

whom the Mohammedan religion is dominant; Visayan peoples inhabit the provinces of Misamis and Surigao. The island was first occupied by United States troops in 1899, and since that time numerous garrisons have been established, and operations carried on with a view of regulating intercourse between the Filipinos and Moros, and of gaining the confidence of the people. The provinces of Misamis and Surigao were placed under civil government in 1901, the rest of the island remained under military control until June 1903, when a law was passed by the Philippine Commission, providing civil government for Mindanao (exclusive of the two provinces mentioned above) and its adjacent islands, under the name of the Moro Province. Pop. 495,660. See PHILIPPINE ISLANDS; MOROS.

Mindanao, Grande de, grân'dâ dâ mên-dâ-now', a large river of the island of Mindanao, Philippines. It rises in the Rangayan Mountains, flows south to the Lake of Liguasan, and passing through this lake flows northwest to Ilana Bay. About 25 miles from its mouth it divides into two branches, which enter the bay about five miles apart, with a large delta between them; the north arm is the larger and more navigable; the south arm is narrow and only five feet in depth. The river is navigable for 70 miles for small vessels not drawing over four feet. Its course is mostly through a very fertile region, and it drains an extensive plain with several large lakes; in length and volume it is the largest river of the Philippines. In the upper part of its course it is known also as the Pulangui.

Min'den, Neb., city, county-seat of Kearney County; on the Chicago, Burlington & Quincy railroad; about 120 miles west by south of Lincoln. It is in a fertile agricultural region in which stock raising is also a prominent industry. It has considerable trade in wheat, corn, hay, and live-stock. There are 3,500 volumes in the public school library. The population in 1910, 1,559.

Minden, Prussia, a town of Westphalia, on the left bank of the Weser, 35 miles southwest of Hanover. It is one of the oldest towns in Germany, and the streets in the ancient parts are narrow and crooked. It has a fine cathedral of the 13th century, in the early pointed Gothic style, a gymnasium, and an orphan hospital; manufactures of tobacco, chicory, chemicals, soap, lamps, machinery, etc., and an important transit and general trade. In 1750 the French were defeated here by an Anglo-Hanoverian army during the Seven Years' war. Pop. about 28,000.

Mindoro, mên-dô'rô, Philippines, an island lying south of Luzon, a little north of the centre of the archipelago; length northwest to southeast, 110 miles; width, northeast to southwest, 56 miles; area, 4,050 square miles, with dependent islands, 4,101.

The island is mountainous, the general topographical features consisting of several high broken ranges forming an elevated plain in the interior; and from this plain sierras extend in different directions toward the coast, which is mostly low and marshy, especially on the north and east; on the west coast along Mindoro Strait is prairie land. The culminating point of the mountain system is Halcón Mountain in the

MINE GAS—MINE RUN

north (8,000 feet). There are numerous small rivers, but no general river system of main stream and tributaries. The climate is variable; the rainfall heavy and monsoons frequent; the western coast is temperate and healthy, but the northern and eastern coasts are hot.

At one time, before the decay of the Spanish monarchy, the rice yield was so abundant that Mindoro was called "the granary of the Philippines"; but the frequent attacks of Moro pirates destroyed the prosperity of the island, and the agricultural products are now unimportant, being almost entirely for home consumption. Rice, sugarcane, coconuts, tobacco, hemp, cotton, etc., are raised; the cultivation of hemp is increasing, and a small amount of cotton is exported to the island of Iloilo. In the time of the early Spanish explorers reports of great mineral wealth, especially gold, were circulated; the real mineral resources are but little known, though as far as modern exploration has gone copper, gold, and coal have been found. The island is heavily wooded, and its chief commercial wealth is in forest products; the trees include cedar, ebony, mahogany, gum trees, gutta-percha, palms and dye woods. Near the principal towns wood-cutting and rattan splitting for the Manila market is the chief industry; rattan, buri, honey, forest gums, balao oil, pitch, and other forest products are the chief articles of export; tortoise-shell, obtained from the small neighboring islands, and canoes cut from a single piece of wood are also exported; and there is a considerable production of sago. There are only a few roads, access to inland villages being by mountain trails or by river-canoes; the local trade between coast towns is carried on mostly by native sailing craft; all exports for Manila and other islands are concentrated at ports of call for steamers.

In June 1902 civil government was extended to Mindoro and adjacent islands, and it was detached from the province of Cavite and made a sub-province of Marinduque (q.v.). The inhabitants of the interior are wild tribes, among whom the Mangianes predominate, the people of the north coast are mostly Tagalogs, those of the south coast, Visayans. Pop., estimated to include wild tribes of interior, 100,000.

Mine Gas, the same as fire-damp (q.v.).

Mine Run, Campaign of. On 7 and 8 Nov. 1863 Gen. Meade crossed the Rappahannock at Kelley's Ford and Rappahannock Station (q.v.), and concentrated his army of 70,000 men in the vicinity of Brandy Station, Gen. Lee, with 50,000 men, withdrawing beyond the Rapidan to an entrenched line, the left of which covered some of the fords of the river, the right being perpendicular to it and extending to Bartlett's Mill on Mine Run. On 26 November Meade began the Mine Run campaign by sending the First, Fifth, and Second corps to cross the Rapidan at Culpeper Mine and Germanna fords, and the Third and Sixth corps to cross at Jacob's Mill, all five corps to converge upon the old turnpike and the plank-road near Robertson's Tavern, both leading to Orange Court House, and turn the right of Lee's position. An early start was made on the 26th, but owing to delay in some of the columns, all were halted for the night but a short distance beyond the river. The march was resumed at daylight of the 27th. The Second corps reached Robertson's Tav-

ern at 10 A.M., to find itself in the presence of a considerable body of Ewell's corps which Lee had hastened there, and it was ordered to remain on the defensive, until the Third corps, followed by the Sixth, came up on the right. But the Third corps was delayed. Lee, on discovering Meade's movement, had promptly ordered Early, commanding Ewell's corps, to move to the right. Part of his command had reached Robertson's Tavern and confronted the Second corps, and Johnson's division was moving in the same direction when it came into collision with the Third corps, on Payne's Farm, and a battle ensued, lasting until dark. Both sides claimed the advantage, but the engagement resulted in a delay to Meade's operations, and, as he claims, the failure of his campaign. The Union loss was 125 killed, 757 wounded, and 71 missing. Lee reported a Confederate loss of 545. The Second corps was severely engaged during the day, and advanced some distance beyond Robertson's Tavern. At night the First corps moved up to the support of the Second. The Fifth corps, which had supported Gregg's cavalry division in an engagement at Parker's store, on the Orange plank-road, was brought over to support the Second, and next morning the Third and Sixth corps came up on the right of the Second. On the 28th Meade advanced to the attack, but on driving in the Confederate pickets it was found that Ewell's corps had fallen back. Pursuit was made, the Second corps in advance, and after a march of two miles Ewell was found in position on the west side of Mine Run. A P. Hill had come up and formed on Ewell's right, covering the Orange plank-road. The line was very strong, and on it were 150 guns. It was after dark when the Second, Sixth, and First corps, with part of the Third, fronted this position. An examination of Lee's position convinced Meade that there was no probability of success in an attack in his immediate front, and he determined to send Gen. Warren, with his Second corps and a division of the Sixth, to feel for Lee's right flank and turn it if practicable. The 29th was spent in reconnoitering and demonstrations, while waiting for Warren's movement. Early in the morning of the 30th Warren started from Robertson's Tavern, crossed over to the plank-road, drove in the skirmishers of A. P. Hill's corps, and late in the day came upon Hill's position across the road. Warren reported to Meade that the conditions were favorable for an attack, and personally assured him that he could carry everything before him. Meanwhile some of Sedgwick's division commanders had discovered weak points on Lee's left, no works being thrown up, and Meade ordered an attack for the morning of the 30th, the right and centre to open with artillery at 8 o'clock, at which time Warren was to make the main attack, and at 9 o'clock Sedgwick was to assault Lee's left with five divisions of the Fifth and Sixth corps. Two divisions of the Third corps were sent to Warren, thus increasing his command to six divisions of 26,000 men. The batteries on the right and centre opened a furious fire at 8 A.M. The skirmishers of the First and Third corps advanced across Mine Run and drove in those of the enemy, and Sedgwick was about to assault when Meade ordered him to desist. He had received a despatch from Warren advising against an at-

MINE SURVEYING—MINERAL COLORS

tack on Lee's right, as it could not succeed. During the night of the 30th Warren had made dispositions for an overwhelming assault, but on the morning of the 30th he saw on the heights before him a line of strong works thrown up over night, well filled with infantry, and heavy batteries covering the slope up which it was necessary to charge, and therefore he deemed successful attack impossible. Meade rode over to Warren, who proved unchangeable in opinion, and Meade tried to arrange for an attack later in the day, but found it impracticable. The armies remained confronting each other that day and the next, and on the night of 1 December Meade withdrew to his former position beyond the Rapidan. Lee followed part way on the 2d. The Union loss in the Mine Run campaign, 26 November–2 December, was 173 killed, 1,099 wounded, and 381 missing. The Confederate loss was 110 killed, 570 wounded, and 65 missing. Consult: 'Official Records,' Vol. XXIX.; Humphreys, 'From Gettysburg to the Rapidan'; Pennypacker, 'Life of General Meade'; Wather, 'History of the Second Army Corps'; Powell, 'History of the Fifth Army Corps'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

Mine Surveying. See SURVEYING.

Mine Workers of America, United, an American labor organization, formed 25 Jan. 1890, to 'unite mine employees that produce or handle coal or coke . . . and ameliorate their condition by means of conciliation, arbitration, or strikes.' Its executive officers are president, vice-president, and secretary-treasurer; a National Executive Board is made up of these officers and of 25 delegates, one each from the various district divisions. The United Mine Workers made great gains in membership by its bituminous strike in 1897, and by the famous anthracite strikes of 1900 and 1902; the two last mentioned strikes were under the leadership of President John Mitchell (q.v.). The policy is typically aggressive and almost the entire funds of the union are used to support strikes and spread the organization. The organ is 'The United Mine Worker.' John P. White was chosen president 25 Jan. 1911.

Miner, Alonso Ames, American Universalist clergyman: b. Lempster, N. H., 17 Aug. 1814; d. Boston, Mass., 14 June 1895. He was educated in secondary schools, taught for a time, was ordained to the Universalist ministry in June 1839, was pastor at Methuen, Mass. (1839–42) and at Lowell (1842–8), was colleague of Hosea Ballou at Boston (1848–52), and full pastor (1852–62; 1874–95). In 1862–74 he was president of Tufts College (Medford Mass.). He originated the Universalist publishing house, Boston; was chairman of the American Peace Society, which he represented at the international congress, Paris, 1889; was Prohibition candidate for governor of Massachusetts in 1878 and for mayor of Boston in 1893; and was also once known as a lecturer on anti-slavery. He edited the 'Star of Bethlehem' at Lowell, and published: 'Bible Exercises' (1854–84) and 'Old Forts Taken' (1878–85).

Miner, Thomas, American physician: b. Middletown, Conn., 15 Oct. 1777; d. Worcester, Mass., 23 April 1841. He was graduated at Yale

College in 1796. The next six years were passed in teaching, and in the study of law, which in 1803 he abandoned for medicine, and in 1807 he commenced practice at Middletown. There prevailed about 1809 in the Connecticut Valley a malignant epidemic fever, for which Dr. Miner and his friend Dr. William Tully pursued a new mode of treatment, the former making careful notes of his cases, and numerous autopsies of those which proved fatal. In 1819 he was compelled by disease of the heart to withdraw from active life, and confined himself to a consulting practice and writing. In 1823 he published, in connection with Dr. Tully, 'Essays on Fevers and Other Subjects,' and in 1825 a treatise on 'Typhus Syncopalis.' Both works enjoyed a wide circulation.

Miner, William Harvey, American journalist and author: b. New Haven, Conn., 5 March 1877. He was graduated from Columbian University in 1899, was for a time on the staff of the Lowell (Mass.) *Mail*, and published: 'George Catlin: A Memoir' (1900); 'Daniel Boone' (1900); 'The Lewis and Clark Expedition' (1901); 'The Rowfant Club' (1903).

Mineral Acids, Toxicology of. Ingestion of sulphuric acid causes pain in mouth, nose, throat, and epigastrium; bloody saliva; vomiting; bloody diarrhoea; feeble pulse; cold, damp surface; and collapse. Ulceration of stomach and larynx may occur and if the patient survives a form of Bright's disease follows quickly. The antidote is any available alkali, as soap, chalk, magnesia, or whitewash, scraped, perhaps, from a wall. Hydrochloric acid (q.v.) causes similar though possibly less severe symptoms, and recovery is more often possible. The antidotes are the same. Nitric acid (q.v.) exceeds sulphuric in the violence of the symptoms caused, with sudden death. Instead of black sloughs in the mouth, œsophagus, and stomach, such as occur in sulphuric-acid poisoning, in nitric-acid intoxication yellow sloughs and stains are found after death. Nitromuriatic-acid poisoning resembles poisoning by nitric acid in symptoms and pathological results. Similar yellow staining is found. The antidotes are alkalis. Phosphoric acid (q.v.) is not corrosive to animal tissues, though the glacial acid coagulates albumen. Its antidote is any alkali at hand, but it is probably not dangerous.

Mineral Colors, inorganic materials in the making of paint. They date as far back (or farther) in the history of coloring materials as organic materials, the paints used by primitive peoples for personal decoration being more commonly of this class. In Greek painting the main sources of coloring matters were: carbonate of chalk for whites; red and yellow ochres; and carbon. Apparently these same colors were used in Egyptian wall-painting. The range was much widened at the beginning of the Christian era at Rome, and the chemical activity of the last century has added largely to the mineral sources of colors. These may be roughly classified as follows: whites from calcium, for example, carbonate and sulphate; from barium, for example, sulphate (natural and artificial) and tungstate; from lead, for example, carbonate, hydrocarbonate, sulphate, antimonite, tungstate; from zinc, the oxide, oxychlorine, etc.; from silicon and talc; from antimony; and

MINERAL PRODUCTION OF THE UNITED STATES

from the hyponitrate of bismuth. Reds are based on iron, as sesquioxide and red ochre; on mercury; on lead, as minium; on arsenic, as arseniate of cobalt; on antimony and on gold. The greatest source of yellows is chromic acid derivatives; next the lead colors; and then the ochres, and other minor sources. Blues are derived from copper (hydrate, arseniate, carbonate), from cobalt (aluminates and silicates), and from iron (phosphates, etc.);

greens from chrome (notably sesquioxide), copper, manganese, etc.; and blacks mostly from carbons. An excellent hand-book of the subject is Perret, 'Couleurs Minérales' (1902).

Mineral Production of the United States. The mineral wealth of the United States has steadily increased in the value of the annual product so that it has for several years exceeded \$1,500,000,000 a year. The figures for 1908 and 1909 are as follows:

MINERAL PRODUCTION OF THE UNITED STATES. (First Products.)

PRODUCTS	1908		1909	
	Quantity	Value	Quantity	Value
Arsenious oxide.....			2,426,000 pounds	\$52,946
Asbestos.....	936 short tons	\$19,624	3,085 short tons	62,603
Asphalt.....	161,011 short tons	1,911,060	233,379 short tons	1,933,527
Bituminous rock.....	37,371 short tons	146,891	55,376 short tons	205,756

Mineral Tallow (Hatchettin, Hatchettite, or Adipocere Mineral), a fatty mineral, 86 per cent carbon, and 14 per cent hydrogen, discovered by Charles Hatchett, English chemist, in the clay ironstone of Merthyr Tydvil. It looks like wax, is greenish yellow in color, and has a pitchy or bituminous smell when heated.

Mineral Waters, a commercial and medicinal name applied to all spring waters which possess qualities in relation to the animal body different from ordinary water. Mineral waters have been used as remedial agents from the earliest days of Greece and Rome. There were sulphurous thermal springs at Tiberius, which are still used by invalids from all parts of Syria, in cases of tumor, rheumatism, gout and other diseases. There are also warm springs at Calirrhoe, near the Red Sea, which are mentioned by Josephus as having been tried by Herod in his sickness. The Romans discovered the thermal springs in Italy, and the springs in other parts of Europe; Baden-Baden, Aix-la-Chapelle, the Spa in Belgium, and others.

Pliny mentions mineral springs in various parts of Europe.

Classification.—No classification of mineral waters based upon their chemical composition can be strictly exact, because many springs are intermediate between well characterized groups. The following classification is regarded as the most convenient: (1) Alkaline waters; (2) Bitter waters; (3) Muriated waters; (4) Earthy waters; (5) Indifferent thermal waters; (6) Chalybeates; (7) Sulphurous waters. The therapeutic action of mineral waters depends chiefly upon their chemical composition and their temperature, though other circumstances, as situation, elevation, climate, geological formation and mean temperature have an important bearing upon the success of the treatment.

Temperature.—The best time for undergoing a course of mineral waters is, in the majority of cases, the months of June, July, August and September. There are, however, exceptions depending upon climate. Early rising is usually advisable during a course of mineral waters,

MINERAL WATERS

and, as a general rule, the water should be drunk before breakfast, at intervals of about a quarter of an hour between each tumbler, moderate exercise being taken in the intervals. In many cases bathing is of even greater importance as a remedial agent than drinking. Baths are generally between breakfast and dinner, and should never be taken soon after a full meal. The time during which the patient should remain in the bath varies very much at different springs, and the directions of the local physician should be strictly attended to on this point. As a general rule, the treatment should not be protracted beyond the space of six weeks or two months, but on this point the patient must be solely guided by the physician resident at the springs. Indulgence in the pleasures of the table, and excesses of any kind, frequently counteract the salutary effects of the waters, while perfect mental relaxation is an important auxiliary to the treatment. As regards temperature, if the waters are between 70° and 98° they are called tepid, while all exceeding the latter are classified as hot springs. The following examples give the degrees of temperature found in different thermal springs: Sweet Springs, W. Va., 74°; Warm Springs, French River, Tenn., 95°; Washita, Ark., 140° to 156°; San Bernardino Hot Springs, Cal., 108° to 172°; Las Vegas, N. Mex., 110° to 140°; Sulphur Springs, Aix-les-Bains, France, 108°; Kaiserquelle, Aix-la-Chapelle, Prussia, 131°; Carlsbad, Bohemia, 162°.

American Springs.—In the United States the Rock Spring was known at Saratoga, N. Y., among the Indians as early as 1767, and over 40 springs have since been discovered there. In 1830, springs were well and popularly known in West Virginia, and of these the Bath mineral spring, now known as the Berkeley Spring, was visited as early as 1777, while the White Sulphur Springs were used by the Indians in 1778. In these American springs, like those in Europe, the geologists agree that dissolved mineral substances are obtained from the rocks through which the water has flowed. The majority of waters contain carbonic acid which greatly increases their solvent powers in the presence of lime, magnesia and iron. If the waters are alkaline they may take up substances which are ordinarily rather insoluble, such as silica. There is, undoubtedly, more or less relation between hot springs and the geological structure of a region.

Alkaline Waters.—Simple alkaline acidulous waters are composed of carbonic acid and bicarbonate of soda. The most important springs of this class are the thermal springs of Las Vegas, N. Mex., and the cold springs at Sharon, N. Y. These waters are useful in certain forms of indigestion, jaundice, gallstones, gravel, gout, and chronic catarrh of the respiratory organs. Muriated alkaline acidulous waters, which differ from the preceding, containing a considerable quantity of chloride of sodium. The most important springs of this kind are the thermal springs of Ems, and the cold springs of Selters and Salzbrunn. They are useful in chronic catarrhal affections of the bronchial tubes, the stomach and intestines. Alkaline saline waters contain sulphate and bicarbonate of soda, such as the warm springs of Carlsbad, serviceable to patients suffering from abdominal plethora, if unconnected with diseases of the heart or lungs. These waters afford an excellent remedy for habitual constipation.

Bitter Waters.—The chief contents of these waters are the sulphates of magnesia and soda. The best known springs of this class are those of Sedlitz and Kissingen; English examples are in the bitter waters of Cherry Rock, in Gloucestershire, and the Purton Spa, in Wiltshire, and in America the springs at Mt. Clemens, Mich. These waters act as purgatives and diuretics.

Muriated Waters.—Simple muriated waters contain a moderate quantity of chloride of sodium or common salt. The chief springs of this class are Wiesbaden and Baden-Baden, which are hot; and those of Kissingen, Homburg, and Cheltenham, which are cold. The muriated saline springs of Saratoga, in the United States, are some of them chalybeate, others sulphurous or iodinous; all of them being rich in carbonic acid gas. The Ballston saline springs near Saratoga have a very high proportion of carbonic acid. They are chiefly employed in cases of gout, rheumatism and scrofula. Muriated lithia waters contain chlorides of sodium and lithium. In gout they first aggravate the pain, but then give relief; and in periodic headache they have been found serviceable.

Earthy Waters.—These contain sulphate and carbonate of lime. The Wildungen water is a diuretic, and not only promotes the elimination of gravel, but by its tonic action on the mucous membrane of the urinary passages, serves to prevent the formation of fresh concretions. It is also much used for chronic catarrh of the bladder. The baths of Leuk, in which many patients remain nine hours daily, until an eruption appears, are chiefly used in chronic skin diseases.

Indifferent Thermal Waters contain a small amount of saline constituents. Of the springs of this class the most important are Hot Springs, Ark., and Roanoke, Va. Their most striking effects are to stimulate the skin and excite the nervous system. They are especially used in chronic rheumatism and chronic gout and in diseases of the skin.

Chalybeate Waters.—Simple acidulous chalybeates contain carbonic acid and bicarbonate of protoxide of iron. Saline acidulous chalybeates, contain sulphate of soda and bicarbonate of protoxide of iron. The quantity of iron present is very small—from .08 to .15 in 1,000 parts. Many of the chalybeate springs, especially in Germany, contain also much carbonic acid; carbonate, sulphate, and chloride of sodium are frequently present, and may help in the cure. The Putnam Spring at Saratoga and the springs of Maine and Massachusetts are examples of chalybeate wells which are very seldom thermal. Maine has both chalybeate and sulphurous springs. Chalybeate waters are valuable in anemia.

Sulphurous Waters.—These waters contain sulphuretted hydrogen or metallic sulphides (sulphurets), or both. The most important sulphurous thermals are those of Aix-la-Chapelle, Baden, Barèges, and Bagnères de Luchon, in Europe. There are hundreds of these sulphurous springs in the United States, including those at Mt. Clemens, Mich., Bath, Va., and Warm Springs, Va. They are extensively used in chronic diseases of the skin, and are of service in many cases in which exudations require to be absorbed, as in swellings of the joints, in old gun-shot wounds, and in chronic gout and rheumatism. The sulphurous waters are employed

MINERAL WOOL—MINERALOGY

externally and internally, and mineral mud-baths are believed by many physicians to form a valuable auxiliary.

Production.—The commercial output of mineral waters in the United States in 1909 amounted to 64,674,486 gallons, valued at \$6,894,134. The imports in the same year amounted to 3,464,524 gallons, valued at \$1,085,177. These figures are based on 760 springs as against 695 springs in 1908. Minnesota, New York, Wisconsin, Massachusetts, Michigan, Ohio, and California are the largest producing States in the order given. A number of foreign mineral waters are imported in the United States and find a large sale. Chief among these is the Apollinaris water which comes from Ahrweiler, Germany. The majority of the commercial springs of the United States are found east of the Mississippi. In the South, Kentucky, Tennessee, and Arkansas are the chief producers of mineral waters. The Hot Springs of Arkansas are among the most important thermal springs in the entire country. The Texas springs are peculiar from the fact that many of them show free sulphuric acid. In Wisconsin the springs of Waukesha are widely known. In New Mexico, the Las Vegas Hot Springs are often visited. There are no hot springs in the New England States.

Bibliography.—Althaus, 'Spas of Europe' (1862); Glover, 'Mineral Waters' (1857); Tichbourne, 'Mineral Waters of Europe' (1883); Walton, 'The Mineral Waters of the United States and Canada' (1890).

Mineral Wool, a product of molten slag, or rock under air or steam-jet, also called slag wool, rock wool, silicate cotton, cotton fibre. The result of this process is a thin vitreous fibre, useful as a non-conductor. It was first manufactured in Germany in the early 70's. In 1875 a little was made at the Greenwood iron furnace, Orange County, N. Y.; the industry was firmly established by 1885; then because of the entry into the field of rock wool, that is, a fibre made directly from the rocks and not from slag, the slag wool industry fell off. In 1909 11,626 tons of mineral wool, valued at \$201,621, was the product of the United States, a gain of more than 35 per cent over the preceding year when the product weighed 9,197 tons and was valued at \$77,228. These figures included rock and slag wools; the former command a price 50 per cent higher than the latter. The slag wools have a small percentage of sulphur, unless especially desulphurized after the slag has been re-melted, and thus sulphuric acid may be formed if water gets access to the wool and acts on the calcium sulphide in it. The sulphuric acid thus formed is injurious to the pipes. Hence rock wool is substituted for slag wool, or the slag wool is carefully desulphurized. Mineral wool of either sort, if of good grade, is one of the best practical non-inflammable coatings; as a lining for floors it has the double advantage of being sound-proof and non-conducting.

Mineralogy, the science which treats of minerals, or those inorganic portions of the earth's crust and the celestial bodies, either solid or liquid, which are homogeneous and whose composition may, therefore, be expressed by a definite chemical formula.

Scope and Utility of Mineralogy.—The researches of the mineralogist unfold to him all of

the beauties of inorganic nature; he climbs the loftiest mountain peaks to gather there the pellucid rock crystals which the ancients believed were permanently solidified ice; he descends with the miner into the depths of the earth to bring forth her precious metals; he visits the dark caverns and from beneath the slowly dropping mineral-laden waters he chisels the delicately veined and clouded Mexican onyx; in the "blue ground" in the interior of the dark continent he uncovers the sparkling diamond, while on the shores of Brazil he finds the wonderful monazite sands which the chemist has transformed into light. The mineralogist impartially records the composition and all of the properties of every mineral and thus makes available for the chemist, the inventor and the manufacturer a host of suggestive facts. It is not surprising, therefore, that new uses for minerals are constantly being discovered, indeed few are the arts to which mineralogy does not make some important contribution. The student of mineralogy is instantly charmed with the external beauties of form and color in crystallized minerals. He is soon brought to consider the still more interesting phenomena and problems connected with their internal structure. Many of the physical properties of minerals are exceedingly interesting, while chemical mineralogy opens up a wide and most attractive field for research.

History.—The mention of the precious stones in the breast-plate of the Hebrew high priest (Ex. xxviii. 17) shows that the beauties of the mineral kingdom were appreciated as long ago as 1491 B.C. There is still extant part of a work, 'On Stones,' written by Theophrastus, who died 286 B.C., while Pliny in his great work on natural history, published 77 A.D., devotes much attention to ores, metals, stones and gems. The birth of mineralogy as a science took place in the publication by Wallerius in 1747 of his systematic work on mineralogy. Steady progress has since been made, and it would be a long list indeed which would enumerate the names of even the prominent investigators each of whom has made important contributions to the science. J. D. Dana, in the various editions of his great 'System of Mineralogy,' succeeded in reviewing, revising and systematizing the work of others and adding to it the results of much original research, until now, under the no less capable authorship of his son, E. S. Dana, this work is the accepted standard all over the world. Much valuable work has recently been done, chiefly by German investigators, in physical mineralogy, especially in connection with the optical properties of minerals. The present great activity in mining and the growing appreciation of gems and decorative stones, stimulates and often rewards the search for new and interesting minerals. The introduction of the study of elementary mineralogy into many public and private schools is evidence that educators are beginning to appreciate the mental training which it brings, as well as the far-reaching importance of the mineral industry which now enters so largely into every-day life.

Mineralogy is usually considered under the following divisions: (1) Crystallography. (2) Physical Mineralogy. (3) Chemical Mineralogy. (4) Descriptive Mineralogy.

MINERALOGY

cess of solidifying from the liquid or gaseous state, or from solutions, assume certain characteristic forms, with definite molecular structure. These are called crystals. It is the present theory that a crystal is the result of an attraction between its molecules exerted in certain fixed directions. (See *MOLECULAR THEORY*.) As long ago as 1669 the Danish geologist, Nicolaus Steno, proved that while the faces of quartz crystals may vary greatly in their relative sizes, the angles between like faces are constant. In 1704 Dominico Guilielmini advanced the theory that the interfacial angles were constant in all salts and that each had its own form. Near the close of the 18th century Romé de l'Isle first formulated the present law of the constancy of interfacial angles. After examination and measurement with a contact goniometer of a very large number of crystallized minerals and salts, he announced that each could be referred to its own characteristic primitive form, that all crystals of the same substance either had the constant angles of the primitive form or were bounded by secondary faces bearing fixed relations to the primitive form. Abbé

variations in the size of the faces and in their distances from the plane of symmetry do not destroy their symmetry, because their interfacial angles are not changed. Cuprite, for example, occurs in cubes and also in needle-like crystals which careful examination shows are simply cubes enormously elongated in one of the axial directions. As it can be proved by physical tests that the molecular structure is identical in each of these forms of cuprite, the crystallographer does not consider that distortion destroys symmetry. In studying the relations of the faces of crystals the existence is assumed of certain fixed lines of reference called axes. The crystal faces intersect these axes and by measuring the interfacial angles the proportionate lengths of the axes can be calculated. These lengths are known as the axial ratio. The law of rational intercepts, which is one of the foundation stones of crystallography, asserts that any face of a crystal, extended if necessary, will cut the axes at distances which can be expressed by simple multiples or fractions of the axial ratio. For example, the primitive rhombohedron of calcite, *r* (see Figs. 1, 2, and 3), cuts the

FIG. 1.

FIG. 2.

FIG. 3.

Haüy, about 1784, discovered that even the most complex crystal forms could be reproduced by the addition to the primitive form of successive layers of minute primitive forms, each layer containing a uniformly smaller number of rows than its predecessor. From these observations he concluded that crystals were formed of minute particles each having the primitive form and all symmetrically arranged. Whether his hypothesis of the shape of the molecules be true or not, all crystallographers are agreed that a definite molecular structure is essential to the existence of a crystal. The molecules are assumed to be almost infinitely minute, for the surfaces of crystals, even when viewed with the highest powers of the microscope, appear perfectly smooth. It seems certain also that the molecules are not in contact with one another, but are separated by distances probably as great or even greater than their diameter, for only thus could heat and light waves be transmitted through them. The particular form which a crystal assumes is determined by the manner in which the molecules group themselves in response to the intermolecular forces. These forces vary greatly in intensity and direction and thus produce the different types of crystals. Examination of a large number of crystals shows that most of them exhibit distinct symmetry. As the symmetry of faces is but the external manifestation of the internal molecular structure,

vertical axis at the unit distance; the rhombohedron *e* at half the unit distance, while the rhombohedron *f* cuts it at twice the unit distance. Prof. W. H. Miller of Cambridge University in 1839 expanded Whewell's application of spherical trigonometry to crystallography and deduced a method of designating the relative positions of the faces by certain simple indices. Miller's system of notation is very extensively used and is gradually supplanting other more complex systems.

Though the variety of crystal forms is almost endless, they are all embraced in one of the six systems of crystallization whose relations are as follows:

(A) CRYSTALS HAVING 3 AXES.

I. AXES AT RIGHT ANGLES.

1. *Isometric System*. Axes all of same length.
2. *Tetragonal System*. Two axes equal, third longer or shorter.
3. *Orthorhombic System*. Axes all of different lengths.

II. ONE AXIS OBLIQUE TO OTHER TWO.

4. *Monoclinic System*. Axes all of different lengths.

III. ALL AXES OBLIQUE TO EACH OTHER.

5. *Triclinic System*. Axes all of different lengths.

(B) CRYSTALS HAVING 4 AXES.

6. *Hexagonal System*. Three axes of equal length and intersecting each other at equal angles; fourth axis at right angles to other three.

A twin crystal is one in which one of the halves of a single crystal, or one of two whole

MINERALOGY

crystals, appears in a position exactly reversed in reference to the other half or the other crystal, as though it had been revolved exactly 180° usually on or parallel to one of the simple faces of the crystal, called the twinning plane. Contact twins generally appear like the reversed halves of a single crystal, as seen in figures 4 and 5. This form, known as the spinel twin, is

FIG. 4.

FIG. 5.

common with spinel and diamond and is occasionally seen in magnetite. Penetration twins result from the union of two complete crystals by the revolution of one on the twinning axis through 180° . One of the commonest illustrations is the Carlsbad twin of orthoclase, figure 6. Eleven distinct types of twinning are known in orthoclase. Among the triclinic feldspars polysynthetic twinning is very common. This is a repeated twinning, usually of lamellae so thin as to manifest their presence only by fine striations.

While crystals usually occur isolated or in irregular clusters, they are frequently found grouped in parallel position, as shown in figure 9 of amethyst from Montana.

FIG. 6.

FIG. 7.

The surfaces of crystals are sometimes covered with parallel lines called striations. These lines are really alternate furrows and ridges and are symmetrically arranged in reference to the edges of the crystals. They are due to a conflict between the crystallizing forces which results alternately in one face and then another. The result is this "oscillatory combination" of small faces. Pyrite cubes (figure 7), also quartz, calcite, tourmaline and many other species, often show these striations. Curvature of the crystal

faces often results from this oscillatory combination, as in many calcites from Joplin, Mo., but curvature is also produced by pressure, as in twisted stibnite and quartz crystals, or from certain intermolecular forces, such as those which produce the beautiful arborescent frost crystals often seen on windows or stone walks, as well as the nearly spherical diamonds of Brazil and South Africa and the peculiar forms of gypsum found in the Mammoth Cave, figure 14. Liquid and gaseous inclusions often manifest their presence by moving bubbles. Enclosures of other minerals, such as needles of rutile and tourmaline, are very varied.

Usually the conditions coincident with the formation or deposition of minerals have been such that only confused crystalline masses have been produced. Such aggregates are shown by the structure of the mineral and include (1) Columnar and fibrous, respectively denoting coarse or fine fibres, examples of which are furnished by some tremolite and by cyanite (bladed-columnar) and asbestos. Stellated (e. g., wavellite) and radiated (e. g., pectolite) are varieties of fibrous aggregates. (2) Lamellar, in plates, e. g., selenite. Under this are included concentric, the plates circling crudely around a common centre, e. g., malachite and some banded agate. Foliated, the plates thin and separable, e. g., foliated talc. 'Micaceous is the most perfectly developed type of a foliated structure. (3) Granular, including coarse-granular, e. g., Tuckahoe dolomitic marble; fine-granular, e. g., Carrara statuary marble; impalpable, e. g., lithographic limestone.

Linking crystallized with amorphous minerals are the many interesting imitative forms, a few of which are: reniform, kidney-shaped, e. g., hematite variety kidney ore, figure 10; botryoidal resembling a cluster of grapes, common in limonite, chalcedony, psilomelane; globular or spherical, e. g., pectolite, hyalite; nodular, e. g., flint; oolitic, in masses of small concretions resembling a fish's roe, e. g., oolite; dendritic and arborescent, in tree-like forms, e. g., wad, figure 12; reticulated, net-like, usually due to twinning, e. g., cerussite, figure 16; coralloidal, resembling coral, e. g., aragonite variety flos-ferri.

When one mineral exhibits the characteristic form of another it is known as a pseudomorph after the original mineral; thus quartz (a rhombohedral mineral) appearing in cubes which were originally fluorite is called quartz pseudomorph after fluorite. Pseudomorphs are formed, 1. By a change in chemical composition, e. g., limonite (hydrated iron sesquioxide) pseudomorph after pyrite (iron disulphide). 2. By substitution, e. g., cassiterite after orthoclase, also silicified wood, in which the original wood has been replaced by silica. 3. By incrustation, as in the coating of various objects by the hot springs in the Yellowstone Park.

Physical Mineralogy.—The external form of crystals has been shown to be due to the existence of a definite, internal, molecular structure. Physical mineralogy aims to explain the phenomena observed in connection with this structure.

MINERALOGY

1. Characters Due to Cohesion and Elasticity.—Cohesion is the force which holds the molecules of a homogeneous substance together. Elasticity is the force which tends to bring the molecules when separated back to their original position. These forces manifest themselves in the properties of cleavage, fracture, tenacity, hardness, etc.

(a) Cleavage is the tendency of certain crystallized minerals to break in definite directions, invariably parallel to one or more of the simpler faces of the crystal. In the isometric system cubic cleavage is well illustrated by halite, figure 13; octahedral cleavage by fluorite and diamond; dodecahedral, by sphalerite. In the tetragonal system basal cleavage is shown by apophyllite, prismatic by rutile and wernerite. In the orthorhombic system, topaz has marked basal cleavage, while barite cleaves readily parallel to the prism. In the monoclinic system clinopinacoidal cleavage is exhibited by orthoclase and selenite, basal by the micas and orthoclase, prismatic by amphibole. Pinacoidal cleavage in the triclinic system is prominent in anorthite, albite and rhodonite. In the hexagonal system basal cleavage is shown by beryl, prismatic by nephelite, rhombohedral by calcite and dolomite. Cleavage is one of the most important aids to the mineralogist in the determination of unknown minerals by physical tests and it often enables him to recognize at a glance the crystal system of the mineral. Parting is separation along secondary twinning planes and much resembles cleavage. Pyroxene is a good illustration, figure 8.

FIG. 8.

(b) Fracture is the break of minerals other than cleavage and parting. It is most noticeable when it is conchoidal or shell-like. This fracture which is quite common among minerals is illustrated by figure 11 of uinitahite. A hackly or jagged fracture is shown by copper and other native metals. Wollastonite often well illustrates a splintery fracture.

(c) The hardness of a mineral is its resistance to abrasion, or the resistance which its molecules offer to a body trying to push them into a new position. It is usually, though very crudely, determined by comparison with the following Scale of Hardness introduced by Mohs: (1) Talc; (2) Selenite; (3) Calcite; (4) Fluorite; (5) Apatite; (6) Orthoclase; (7) Quartz; (8) Topaz; (9) Corundum; (10) Diamond. While Mohs' scale is universally used

in all mineralogical works, various methods have been adopted to determine the absolute hardness (see *SCLEROMETER*). Hardness is often one of the most conclusive tests in identifying minerals by their physical properties.

(d) The tenacity of a mineral is the resistance which its molecules offer to an effort to completely separate them. When this resistance is but slight the mineral is termed brittle; if it is stronger so that shavings may be cut off with a knife, but the shavings can be powdered by a hammer, it is called sectile, e. g., talc. Malleable minerals exhibit still greater tenacity, as shavings are not powdered by the blow of a hammer. The native metals, copper, gold and silver, are malleable and also ductile, that is, capable of being drawn out into wire. Flexible minerals are those which can be bent, but in which the force of cohesion is not strong enough to cause the molecules to return to their original position, e. g., foliated talc.

(e) Elasticity in minerals not only involves resistance of their molecules to complete separation, but indicates such a development of cohesion as to prevent a permanent bending of the specimen and lead to its return to its original position when the disturbing force is removed. The micas exhibit this property to a marked degree.

2. The Specific Gravity of a mineral is the ratio of its weight to the weight of an equal volume of water. It is dependent upon the weight of its molecules and the closeness of their aggregation. Corundum, a compound of the exceedingly light metal aluminum with the gas oxygen, nevertheless is comparatively heavy, having a specific gravity of 4. As a single molecule of Al_2O_3 must be relatively light, it follows that corundum is heavy because its molecules are closely aggregated. This will become clear by comparing a cubical box with a single wooden sphere at each corner, to the same box filled with such spheres and imagining that these spheres represent the closely crowded molecules of aluminum in a cubical piece of corundum. The filled box would manifestly be very much heavier, but it would not be nearly so heavy as it would be if the spheres were of lead instead of wood. The average specific gravity among common minerals being about 2.7, any mineral whose specific gravity is considerably greater than 2.7 seems heavy when placed in the palm of the hand. The metals and metallic minerals and most of those minerals which are compounds of the heavier metals have a high specific gravity. Iridium (22.75) is the heaviest; gold and platinum also have a very high specific gravity, ranging from 14 to 19. Very few minerals exceed 10 and all of them are metallic. The specific gravity of a mineral is a property of great importance because it is subject to such slight variations unless the material is impure or contains cavities.

3. Characters Depending Upon Light.—The optical characters which are common to both crystallized and amorphous minerals include chiefly diaphaneity, color, lustre, asterism, fluorescence and phosphorescence.

Diaphaneity or transparency is the quantity of light which a mineral transmits. If a mineral offers but little if any resistance to the passage of light, that is to say, when all the details of an object can be readily seen through

MINERALOGY

It is described as transparent, e. g., rock crystal. If, on the other hand, a mineral permits no light to traverse it, and it is, therefore, impossible to see any object through it, it is called opaque, e. g., jasper. Between transparent and opaque minerals are those which are translucent, e. g., chalcedony, in which light is transmitted, but objects cannot be seen. Very many substances ordinarily perfectly opaque appear translucent or even transparent in very thin sections, e. g., gold.

The color of a mineral is the kind of light which it either transmits or reflects. If transparent a mineral may transmit one kind of light and reflect another; hematite, for example, ordinarily appears black by reflected light, but on looking through thin crystals they appear red. Some minerals transmit different colors in different directions (see DICHRASIC CRYSTALS). The external or superficial colors are those which first appeal to the eye, but they are not usually of great importance because not constant. The essential color or streak of a mineral, which is the color of the mineral when powdered, is a character of first importance because it varies but little regardless of what the external color may be. Play of colors, change of colors, iridescence, tarnish and opalescence are properties whose study is full of interest.

The lustre of a mineral is the manner in which it reflects light. According to its intensity it is said to be splendid, shining, glistening, glimmering, or, if devoid of lustre, dull. In describing its quality minerals are separated into metallic, sub-metallic and unmetallic. Metallic minerals, of which galena is a good illustration, are not considered to possess a metallic lustre unless they are opaque. The unmetallic minerals are further divided into adamantine, the lustre of the diamond; vitreous, glassy, e. g., rock crystal; resinous or waxy, e. g., sulphur, amber; greasy, e. g., elaeolite; pearly, e. g., brucite; metallic-pearly, e. g., bronzite; silky or satiny, e. g., chrysotile, satin spar. Lustre is a quality of considerable importance, the first step in the determination of minerals being to decide whether or not they possess a metallic lustre.

Asterism is the property of showing a six-rayed star either by reflected or transmitted light. Star-mica and star sapphire, figure 15, are the best illustrations.

Fluorescence is the property of emitting from within light of one color during exposure to light of other colors, or to the emanations from radium. Fluorite has long been cited as the most prominent illustration of the property, but recent investigations with ultra-violet rays have shown that willemite from Franklin Furnace, New Jersey, is more magnificently fluorescent when exposed to ultra-violet rays than any other known mineral. Some calcite from Franklin Furnace and from Longban, Sweden, shows a charming rose pink fluorescence under the ultra-violet rays. This property seems to be due to a transformation of the rays within the mineral and their emission as light of greater wave length. See FLUORESCENCE.

Phosphorescence is the property of emitting light for a time after gentle heating or after exposure to radium, an electrical discharge or to light. The ultra-violet rays are especially powerful in exciting phosphorescence. Fluorite exhibits both fluorescence and phosphorescence,

but many fluorescent minerals do not phosphoresce. Some New Jersey willemite is magnificently phosphorescent after exposure to the ultra-violet rays. Kunzite glows with a rich red light after excitation by the ultra-violet or the Roentgen rays. Many other minerals, including diamond, wollastonite, pectolite and all the minerals from Borax Lake, Cal., exhibit phosphorescence. Phosphorescence is explained by the transformation into light of the energy communicated to the body by some exciting agent. (See PHOSPHORESCENCE.)

In the more advanced study of mineralogy very great importance is attached to the consideration of the optical characters of crystals. The crystal system and even the identity of the mineral species may often be determined by an examination of its optical characters. Isometric crystals have like optical properties in all directions and are, therefore, called isotropic. The optical properties of all other crystals are unlike in different directions and they are consequently called anisotropic. Anisotropic crystals are subdivided into two groups, isodiametric, including crystals of the tetragonal and hexagonal systems, and anisometric, including crystals of the orthorhombic, monoclinic and triclinic systems. In isodiametric crystals there is no double refraction in the direction of the vertical crystallographic axis, which is called the optic axis, these crystals are consequently said to be uniaxial. The optical structure of uniaxial crystals is represented by a spheroid, a section of which normal to the optic axis is always a circle. Anisometric crystals are more complex, but there are always two directions analogous in character to the single axis of the uniaxial group, so that anisometric crystals are said to be biaxial. Their optical structure is represented by an ellipsoid with three unequal rectangular axes. There are two directions in which such ellipsoids can be cut so as to yield cross sections which are circles. The optic axes are normal to these planes. In orthorhombic crystals the axes of the ellipsoid coincide in direction with the crystallographic axes. In monoclinic crystals one of the ellipsoidal axes coincides with the axis of crystallographic symmetry, while the other two lie in the plane of symmetry. In triclinic crystals there is no essential relation between the ellipsoidal and the crystallographic axes. When examined in polarized light isometric crystals exhibit no special phenomena. (See PHYSICAL CRYSTALLOGRAPHY.)

4. *Characters Depending upon Heat.*—Fusibility is the relative ease with which a mineral melts. Mercury, water and petroleum are the only minerals which are liquid at ordinary temperatures of the atmosphere. Von Kobell's scale of fusibility is 1. Stibnite, fusible in a candle flame, even in large pieces. 2. Natrolite, fusible in a candle flame, but only when in small splinters. 3. Almandine Garnet, easily fusible in the blowpipe flame, even in large pieces. 4. Actinolite, fusible with difficulty in the blowpipe flame in large pieces. 5. Orthoclase, fusible with difficulty in the blowpipe flame, even when in small splinters. 6. Bronzite, scarcely fusible at all. The determination of the fusibility of a mineral is frequently of aid in its identification.

Other minor characters depending upon heat are conductivity, expansion, specific heat and diathermancy.

MINERS — MINERSVILLE

5. Electricity and Magnetism.—Electricity is developed in all minerals by friction, though in greatly varying degrees. If both positive and negative electricity are developed in a crystal by a change in temperature it is said to be pyro-electric, e. g., if tourmaline be heated it becomes differently electrified at opposite terminations. Electricity developed in a crystal by pressure is termed piezo-electricity.

Magnetism manifests itself among minerals in two ways: (1) A few minerals are attracted by a magnet. This attraction is very much stronger in the case of magnetite than any other mineral, but pyrrhotite and platinum are also slightly magnetic. (2) These same minerals are sometimes natural magnets, exhibiting polarity and attracting iron or magnetite. Lodestone is a variety of magnetite which possesses this property to a very marked degree. The attraction of the electro-magnet for minerals containing iron has a very important commercial application in concentration of low grade iron ore.

6. Taste, Odor and Feel.—Taste is a property present only in minerals which are soluble. Salt is the commonest mineral having a decided taste, known as saline. Among rarer minerals, epsomite is said to be bitter, nitre is cooling, chalcantite is metallic, melanterite is astringent, trona is alkaline.

Odor is not emitted by minerals as found in nature, except by the hydrocarbons, many of which have a bituminous odor. It is, however, developed in many minerals by friction, or heat, or by breathing on them.

Soft minerals generally have a smooth or greasy feel, e. g., sepiolite and talc; minerals with a hackly fracture feel harsh, e. g., copper.

Chemical Mineralogy.—The chemical composition of a mineral is its most important characteristic. It is, therefore, essential that the student of mineralogy should have some knowledge of the fundamental principles of chemistry (q.v.). Chemical mineralogy includes the determination of the composition, chemical properties and proper grouping of minerals and the methods of distinguishing the various species. All of the eighty or more elements are found in minerals, but only about eighteen of them occur in nature uncombined. They are grouped into metals and non-metals. Nearly all mineral species are compounds of one or more metals with one or more of the non-metals. The simplest of these compounds consist of the metallic elements combined with oxygen (oxides), sulphur (sulphides), arsenic (arsenides), or some similar non-metallic or semi-metallic elements. A few acids and bases (see CHEMISTRY) occur among minerals, but about three fourths of all described mineral species are salts, or compounds of acids and bases. The chief salts occurring among minerals are the chlorides, carbonates, sulphates, phosphates, arsenates and silicates, the last being by far the most numerous. It is one of the charms of the study of mineralogy to note the relationships existing between the various groups. The blowpipe (q.v.) is a most important aid in identifying minerals by determining their component elements (see BLOWPIPE ANALYSIS). In order to ascertain the exact chemical composition, which is essential in describing a new mineral, a complete quantitative analysis is requisite (see CHEMICAL ANALYSIS).

The recent production, in the laboratories of French chemists, of crystals having the same chemical composition as the natural minerals, is of very considerable interest as throwing light on the methods by which minerals, such as diamond, may have been formed in nature. Most of the common minerals have been duplicated by these so-called "artificial minerals," while artificial rubies of great beauty (see RUBY) are commanding high prices.

Descriptive Mineralogy.—The proper description of minerals may be briefly summarized as including (1) classification; (2) form and structure; (3) physical properties; (4) chemical composition; (5) distinguishing characters; (6) occurrence.

Various schemes of classifying minerals have been proposed, one of the most popular being the grouping under their most prominent metal. The only one which is strictly scientific is that which arranges similar compounds together in one class, further classifies them according to the minor relations between them, and then by their crystal form and other physical properties. This scheme, which is now almost universally adopted, is as follows:

SCHEME OF CLASSIFICATION.

- I. Native Elements.
- II. Sulphides, Selenides, Tellurides, Arsenides, Antimonides.
- III. Sulpho-salts.—Sulpharsenites, Sulphantimonites, Sulphobismuthites.
- IV. Haloids.—Chlorides, Bromides, Iodides, Fluorides.
- V. Oxides.
- VI. Oxygen Salts.
 1. Carbonates, 2. Silicates, Titanates, 3. Nitrides, 4. Phosphates, Arsenates, Vanadates, Antimonates, Niobates, 5. Borates, 6. Sulphates, Chromates, Tellurates, 7. Tungstates, Molybdates.
- VII. Salts of Organic Acids.—Oxalates, Malates, etc.
- VIII. Hydrocarbon Compounds.

Minersville, mī'nərz-vīl, Pa., borough, in Schuylkill County; on the west branch of the Schuylkill River, and on the Philadelphia & R. and the Lehigh V. R.R.'s; about 45 miles north by east of Harrisburg. It is situated in the hard coal region, and its chief industries are connected with mining and shipping coal. Some

MINERVA—MINES

of its industrial establishments are machine shops, foundries, lumber and brick yards. Pop. (1890) 3,504; (1900) 4,815; (1910) 7,240.

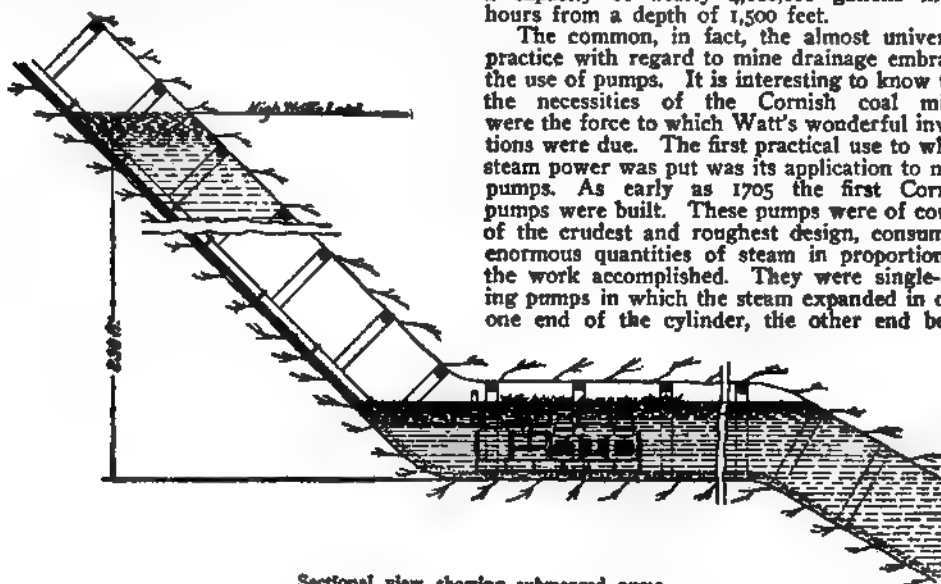

Minerva, mī-nēr'vā, in Roman mythology, a daughter of Jupiter, and one of the great divinities of the ancients. She was looked upon as the patroness of all arts and trades, and her annual festival, called Quinquatrus, lasted from the 19th to the 23d of March inclusive.

Mines, American. See AMERICAN MINES.

Mines, Drainage of. There are but two practical methods of mine drainage: adits, or drainage tunnels, and pumps. The most conspicuous example of the drainage tunnel in the world is probably the Sutro Tunnel, which drains several adjacent mines on the great Comstock Lode. This tunnel is driven four miles from the Carson Valley to where it intersects the Lode, at a depth of 1,600 to 2,000 feet below the outcrops. It, of course, keeps the mines free of water to that depth. Some idea of the magni-

ing to surface. The most primitive way of draining a mine not opened by an adit is to bail out the water in rude leather buckets by man-power. This method was used by the Romans at their mines in Spain and elsewhere, and may still be employed in some remote corner of the world. It is a method for slave labor, hence it was used by the Spaniards in their ruthless search for the precious metals in Mexico and South America. Another way of getting water to surface is to hoist it in buckets, used also for ore, or in tanks of special design. Mines have been drained thus for over a thousand years, and countless prospect holes and mines making little water are so drained to-day. A large scale development of hoisting water is practised at several deep shafts in the Pennsylvania anthracite region, where steel tanks holding as much as 2,600 gallons each are quickly lifted from depths of over 900 feet by powerful engines. The largest of these water hoists, that at the Lytle shaft, not far from Pottsville, has a capacity of nearly 4,000,000 gallons in 24 hours from a depth of 1,500 feet.

The common, in fact, the almost universal, practice with regard to mine drainage embraces the use of pumps. It is interesting to know that the necessities of the Cornish coal mines were the force to which Watt's wonderful inventions were due. The first practical use to which steam power was put was its application to mine pumps. As early as 1705 the first Cornish pumps were built. These pumps were of course of the crudest and roughest design, consuming enormous quantities of steam in proportion to the work accomplished. They were single-acting pumps in which the steam expanded in only one end of the cylinder, the other end being

Sectional view showing submerged pump.

tude of this work may be gathered from the fact that it consumed nine years in the building and cost \$7,000,000. It discharges 12,000 tons of water daily, and it is estimated that it would require the expenditure of \$3,000 a day to pump this water from the mines. The obstacles in connection with this tunnel were stupendous, heat, gases, and quicksands were encountered and had to be overcome. The credit for its successful completion is due to Adolph Sutro, the promoter and tireless backer of the work, and to his engineer, Alfred Craven, who executed it.

Though mineral deposits are often opened by adits, or tunnels, since in this way the actual working costs are reduced to a minimum, yet tunnels can be driven to advantage only where conditions are such as to ensure a return on the great initial expense. Consequently most shallow mines, and practically all deep mines, are opened by shafts, and the water has to be forced to surface, or to the level of an adit lead-

open, and the cylinder being connected to one end of a walking-beam, the other end of which was attached to a long chain of rods running down to the pump plunger at the bottom of the shaft. The expansion of the steam forces this plunger to rise, and it falls again by gravity at the end of the stroke. Prior to the use of steam these pumps had been used for many years with horses to supply the power. It is from this source that we have obtained our common measurement of steam in horse-power units. These old pumps have hardly yet disappeared from use, the writer himself having seen one in northern Pennsylvania, which had been abandoned only a few years.

The problem confronting the engineer in designing mine pumps is an exceedingly difficult one, the lifts frequently ranging up as high as 2,000 feet to a single stage. Some idea of the volume of water required to be lifted may be gathered from the fact that for every ton of anthracite coal taken out in Pennsylvania, 15

DRAINAGE OF MINES.

9" x 12" Horizontal Triplex Electric Pump. Capacity, 400 gallons per minute against 1,000 vertical lift. 150 H P G E. induction motor. Built for Compania de Penoles, Mapimi, Mexico.

The Standard Anthracite Pattern for vertical lifts up to 750 feet.

19" x 27" and 44" x 9" x 36" Triple Expansion Duplex Pump, fitted with Corliss valves. 1,000 gallons per minute against 1,000 feet lift. Built for Acadia Coal Co., Stellarton, Nova Scotia.

MINES

tons of water are pumped to surface. A large percentage of mine water is of a very highly acidulous nature. In the anthracite fields of Pennsylvania, the bituminous fields of West Virginia, and the copper mines of Montana as many as 160 grains per gallon of free sulphuric and other acids are often found in the mine water. Lastly, the pump runners are, as a class, unskilled laborers. Taking the pump question up in its entirety, the problems confronting the pump designers in the Pennsylvania anthracite fields are undoubtedly the most difficult of solution. It is natural, therefore, that the present-day type of pump which has supplanted the old Cornish type should have been evolved through hard knocks and practical experience on the ground in question.

The present tendency in mine pump practice is toward a large, centrally located station pump, generally placed near the bottom of the mine shaft, to which point all the water in the mine is drawn. This method is, of course, far more economical than placing various small pumps in different parts of the mine, although, owing to the difficulty of draining all the water to one point, the large station pump is frequently supplemented by smaller pumps, which throw to it the water from certain sections of the mine.

While the steam-driven, direct-acting pump is the type most used for mine drainage in the United States, in Europe special types of pumps, little seen in this country, are used. These types include hydraulic pumping engines, centrifugal pumps built to force water several hundred feet vertically at one lift, and what are known as express pumps, pumps having mechanically-operated valves and driven at comparatively high piston speeds; that is, 100 to 150 revolutions of the fly-wheel per minute. In general, mine pumps made by American firms are planned to meet severe conditions. They will handle, day after day, with a minimum of attention, water that may be acid or gritty, and will call for no greater skill from the runner than ability to use a monkey wrench. A pump built to give the highest economy in power consumption can not meet such conditions successfully, for it requires careful supervision. This ability to meet the most severe conditions explains why American-made mine pumps are found at remote camps in distant countries. The type evolved by our manufacturers reaches its highest development in the duplex direct-acting pump with triple expansion steam end, using a condenser, and having the water end broken into small units. Such pumps are built large enough to handle 1,000 gallons of water a minute against a head of 2,000 feet.

Many coal mines continue to use single-cylinder and compound pumps rather than those of the triple expansion type. This is considered good economy where the cost of fuel is very low. The reduced first cost, the lessening of the amount of repairs, and the more simple construction rendering the pump less liable to mismanagement at the hands of the average pump runner than would be the triple expansion pump, offsetting, in the minds of many, the increased cost of fuel.

Some idea as to the tremendous strain to which mine pumps are subjected may be gathered from the following case:

The water in the Jeanesville mine of the

Lehigh Coal Company is very highly acidulous. This company has been using a single-cylinder pump of the Jeanesville type in its No. 4 slope for the past 20 years. Two years and a half ago there was a flood in this valley and the mine was submerged to a depth of 230 feet. Sinking pumps were placed in the shaft and the water was pumped down to the top of the old station pump. As soon as the valve in the steam-pipe was exposed above the water level, a pump runner swam into the pump-room and turned on the steam. The pump, after having been in acid water for 20 years and submerged and in disuse for two and a half years, instantly started to work, and has now completely rid the mine of all surplus water, and active work has been recommenced.

Electricity is rapidly coming to the front as a motive power for running mine pumps. The reasons for this are not far to seek. All steam lines are eliminated from the mines, with their necessary repairs and annoying heat. Electrical transmission losses are practically negligible as compared with steam transmission losses. This is a very serious factor when one considers the necessary distances from the power station at

Triplex single-acting electric power sinking pump.

which the pump must often be placed. Small electrically-driven pumps at considerable distance apart in the mine may be operated with much greater economy than a number of small steam pumps. This feature precludes the necessity of expensive interior drainage for a central station, which is often a very considerable factor. A horizontal triplex double-acting electric pump typifies the highest development yet reached in electrically-driven pump machinery. This pump was built for the coal department of the Delaware, Lackawanna & Western Railroad Company at Avondale, Pa., to drive 1,150,000 gallons per day to a vertical height of 800 feet. The water end is wood-lined throughout to resist corrosive acid water. Wood-lining is a point which should not be passed without some comment.

MINES — MINES AND MINING

It can readily be seen that water containing as much sulphuric acid as does the water in the mines in question would eat through the very best iron in a short time. Attempts have been made to use phosphor bronze, but this adds enormously to the first cost, and even phosphor bronze is destroyed in time. Wood-lining seems to be the only safe preservative, but it has been an exceedingly hard problem to line valve chambers in such a manner that the wood-lining would stay in place. This problem is one which of necessity has been solved on the ground

ous exploring expeditions were conducted during the early history of the country for the purpose of locating mineral deposits, but with little success. The history of coal mining in the United States affords a good illustration of the general development of the mining industry. In 1820 the first cargo of anthracite coal was sent to Philadelphia. The annual consumption of all coal in 1847 was about 3,000,000 tons; in 1909, the production of anthracite coal amounted to 81,059,159 short tons and the production of bituminous coal to 379,744,257 short tons, making the total production 460,803,416 short tons; in 1910, the production of coal, anthracite and bituminous, amounted to 371,288,123 short tons; the value at the mines (1909) was \$554,902,624.

The smelting of iron ore was carried on to some extent in Massachusetts as early as 1702. The production of iron ore in 1840 was about 300,000 tons, and the production of pig iron from the ore in Pennsylvania, in the same year, amounted to 98,395 tons. The Lake Superior region was opened in 1844 and about 800 tons of blooms were shipped from the region in 1853. In 1909, the production of iron ore in Pennsylvania amounted to 666,889 long tons and in the Lake Superior region to 41,942,969 long tons, the production of the two districts amounting to 42,509,858 long tons or 80.2 per cent. of the 51,294,271 long tons reported for the United States. At the present time the United States contributes two-fifths of the entire world's product of pig iron, which, if loaded into ordinary freight cars, would make a train extending over 10,000 miles, or two-fifths around the earth.

Early in the 19th century gold was mined to some extent in North Carolina, and for a number of years following 1829 considerable quantities were produced throughout the Southern States. The discovery of gold deposits in California in 1848 gave an impetus not only to the search for precious metals, but also to mining enterprises of all kinds throughout the country. The production of domestic gold in 1853 deposited at the United States Mint and its branches was valued at \$55,622,051 — \$55,113,487 of which value was obtained from California. The annual production at the present time is \$100,000,000, the gross value of a fine ounce of gold being \$20.24.

The evolution of scientific mining has never been more perfectly demonstrated than in the Black Hills. It is the story of the first crude attempts up to final completeness. The yield of gold has been supplied by four distinct and dissimilar sources — placers, conglomerate beds, quartz lodes, and refractory or blanket deposits. The first discoverers found placer gold in the gulch creeks. The discovery and working of these rich placers was immediately followed by the opening of the conglomerate or cement beds. As soon as machinery could be secured the milling of these ores sustained and increased the production established by the rich but waning placers. Eventually the production of the limited area of the conglomerate beds was relieved by the milling of ore from the permanent quartz veins. Some years later when the railroads came, an avenue was opened for shipment of the silicious ores. Since that time this permanent source of supply has been a large and growing factor in production, more especially in late years when smelters and numerous cyanide mills

Sectional view valve chamber showing wood lining.

where wood-lining is an absolute necessity, and practically all the wood-lining done in America is that known as Jeanesville wood-lining, so named for a small Pennsylvania mining town, where this preservative method has been in use for some 40 years. The action of acid water petrifies the wood-lining and makes it imperishable. Indeed, it has happened that the valve chamber has been destroyed through acid water dripping on and eating away the outer surface of the iron, while the inner wood surface still remains perfectly intact.

When a mine shaft is being put down, sinking pumps are used. These pumps are built of a light portable type and can be let down and hung from a beam or placed as is most convenient. It is necessary to use this type as the shaft is being driven down, for every time the bottom is blasted it is necessary to hoist up the sinker to get it out of the way of the blast. Electricity is rapidly supplanting steam as the power for driving sinking pumps, because, as is obvious, it is far easier to raise the electrical conductors from the shaft to prepare for blasting than to lift many feet of heavy steam piping.

JOHN M. BRUCE,
Of Bruce & Johnston, New York City.

Mines, Submarine. See SUBMARINE MINES.

Mines and Mining. The mining industry in the United States was not important until after the opening of the 19th century, agriculture being the predominating industry. Numer-

have been established at many points convenient to the mines. The importance of the mining industries is due not only to the magnitude of the aggregate production, but also to the great number of different minerals mined, and the numerous uses to which they are applied. The development of these industries has occurred very largely since 1880, as many of the minerals now prominent were not mined in commercial quantities before that year. The existing diversity of metals is largely the result of processes applied to the reduction of the minor metalliferous minerals; while the great absolute increase in quantity and value of mining products, in number of people employed and in yearly wages paid, is due mainly to the development of the major minerals, the great variety of uses to which the minor ores and the metals derived from them can be put has furnished a constant incentive to increase their production.

The organization of the United States Geological Survey, in 1879, was the first step in the scientific investigation of the mineral deposits of the country as a whole. The continued labor of this body, assisted by systematic geological investigations in most of the States, has produced a volume of information concerning the location, character, and extent of the deposits of the minerals in the following classification:

Abrasive Materials.—Buhrstones and millstones, corundum and emery, crystalline quartz, garnet, grindstones and pulpetones, infusorial earth, tripoli and pumice, oilstones, whetstones and scythestones. This classification includes abrasives occurring as rock formation and such abrasive constituents of rock as are mechanically separated from their associated minerals.

Asbestos.—Including two distinct minerals, one being a variety of amphibole and the other the fibrous variety of serpentine, known as chrysotile.

Asphaltum and Bituminous Rock.—Including the hydrocarbon rocks having an asphaltic base—as bituminous limestone and sandstone—and some of the purer forms of bitumen, as elaterite and nintaita.

Barytes.—The mineral barite, known commercially as barytes, and often called heavy spar, from its high specific gravity, used principally in the manufacture of paints.

Bauxite.—Most of the bauxite mined in this country is used as a source of the metal aluminum. The quantity used in the manufacture of chemical salts is comparatively small.

Borax.—The most important salt of boric acid, used for a flux in soldering metals, for making enamels, for fixing colors on porcelain, as a preservative of food, and as a soap, is in this country derived mainly from the colemanite deposits of California, although a little is produced from the marsh deposits of California, Nevada, and Oregon.

Cement.—Hydraulic cements in these three general classes: *Portland Cement* is a compound consisting essentially of lime, silica, and alumina, produced by intimately mixing some form of calcium carbonate with clay. This mixture is calcined and the resulting clinkers are ground to a fine powder. *Natural-rock Cement* is produced by calcining a natural product, such as an argillaceous limestone, possessing the proper proportions of lime and clay for hydraulic cement, and usually considerable

magnesia. *Possuolana*, or slag cement, produced by mixing with slacked lime a natural volcanic scoria or granulated blast furnace slag of suitable composition. Invention has played an important part in the development of the cement industry, both in the improvement of cement compositions and processes of manufacture, and in the perfecting of methods and machinery, whereby the cost of manufacture has been greatly reduced and uniformity of product secured.

Clay.—Including kaolin, ball clay, fire clay, slip clay, stoneware clay, pipe clay, terra cotta, and other varieties of clay mined and sold as such.

Coal.—Classed under two headings: Anthracite, including only the product of the mines in Eastern Pennsylvania; Bituminous, including all soft coals variously known as bituminous, semi-bituminous, semi-anthracite, lignite, and in several instances coal locally termed anthracite.

Copper Ore.—Embracing all ores whose principal or only value is their copper contents. Copper is also recovered as a by-product of the smelting of ores valued chiefly for their precious metal contents.

Calumet and Hecla Mines.—These mines may be cited to show to what extent the copper industry has advanced. This mine, in reality many mines in one, is one of the largest copper producers in the world, and employs more than 5,000 men. It was organized in 1871, under the laws of Michigan, as a consolidation of the Hecla, Calumet, Portland, and Scott Mining Companies. It has paid dividends of nearly \$100,000,000 and embraces about 2,750 acres of mineral lands. The mine proper is opened on the Calumet conglomerate, which, to the north and south, has proven unprofitable wherever tried, though the underlay of the lode, opened by vertical shafts, has given good returns. The Calumet Mine at the north, the Hecla in the centre, and the South Hecla at the south, form one continuous mine, developing the Calumet conglomerate by inclined shafts. It has suffered severely from underground fire. The amigdaloidal trap rock, carrying native metal, cannot burn, like the copper ore mines, rich in sulphur, such as the Anaconda, United Verde, and others, but the old timber eventually becomes nearly as inflammable as so much tinder. The service and equipment of Calumet and Hecla is the most complete known in any mine. With rare exceptions everything is duplicated, to prevent possible delays or suspension through fire or accident. It owns about 1,200 houses occupied by employees, and more than 1,000 dwellings are owned by employees on lands leased from the company. The company also owns a large hotel, a free club-house for employees, a free library, and there are more than 30 churches occupied by a dozen different denominations. The company maintains a hospital for employees, noted for its complete surgical and laboratory apparatus. Nearly a dozen physicians are on the hospital staff. A fire department and three systems of water-works are liberally maintained. The stamp mills are located at Lake Linden, four miles from the mine; the smelting plants are located at Lake Linden and Buffalo. Sufficient mineral is shipped during the season of lake navigation, April to November, to keep the Buffalo works

supplied for the entire year. The company operates a fleet of steel steamers and barges for carrying down mineral and bringing back soft coal. The mills treat about 5,750 tons of rock daily, securing therefrom an average of about 45 pounds of fine copper per ton. Mineral, or crude copper from the mills, runs about 60 per cent. copper.

Flint and Feldspar.—In reality a crystalline or vitreous variety of quartz, there being no production of true flint in the United States. The crystalline quartz, prepared for wood finishing, is usually classed under abrasive materials of the group of feldspars. Orthoclase is the most ordinary species and the one most commonly mined in this country. Both flint and feldspar are used chiefly in the pottery and porcelain industry.

Fluor spar.—Frequently known as fluorite, being a calcium fluoride, varied in color, used chiefly for flux and the manufacture of hydrofluoric acid.

Fullers Earth.—Including various colored, smooth, greasy, clay-like substances, much lighter in silica than ordinary clay, the chief use of which is for clarifying cottonseed and lubricating oils.

Gold and Silver.—Embracing (1) placer mines, which produce gold usually associated with silver, and (2) deep mines, which produce gold- and silver-bearing ore, some of them being equipped with reduction works where the ore is reduced to bullion. The silver mines include also argentiferous lead mines. Mexico is the leading silver producing country, the output of her mines exceeding one-third of the world's production; the United States following close behind, with one-third of the world's output. The recent progress in gold mining has been so closely associated with the great Homestake mine, a knowledge of its operations will give a clear conception of the magnitude of the industries.

Homestake Gold Mines.—Since 1877, the properties owned by the Homestake Mining Company have produced \$75,000,000, out of which have been paid in dividends about \$20,000,000. With the development of its great ore bodies, the company has gradually increased its milling capacity until it is now operating 1,000 stamps, with a crushing capacity of about 4,000 tons of ore per day, and is adding several hundred stamps to its present milling capacity. The company was handicapped in its milling operations by lack of water until the completion of a pipe-line from Spearfish creek to its mills at Lead. This was constructed at a cost of \$1,500,000 and will furnish an abundant supply of water for all time. The ore-bearing area of the Homestake belt, as definitely exploited, is approximately one and one-half miles long and one-half mile wide. The ore lies in bodies of great extent. The free-milling character of the ore is pronounced. Practically all the values of the surface ores are extracted by simple amalgamation. During the first 12 years of mining operations no attempt was made to save the concentrates, though the deeper ores gradually became less free-milling. Concentrates have been saved since 1890. For 30 years they were sent to the smelter at Deadwood for treatment, but in 1900 the company erected a 1,300-ton cyanide plant, which is now successfully

treating the tailings by this process. The operation of this plant proved to the company's satisfaction that the cyanide process can be used advantageously, and it has erected a second plant of 700-ton capacity at Central City. The company has five main shafts 700, 800, 900, 1,100, and 1,200 feet deep, respectively, the bottom of each shaft being in ore, with the ore-bodies still continuing downward. The ore not only maintains its value with depth, but shows an increase in value. At the 800-foot level there is a solid body of ore more than 600 feet wide which is formed by the union of several veins running from the surface. It is estimated that enough ore is in sight to run the mills at full capacity night and day for 35 years without opening new veins. Nowhere in the world are there to be found such large open-cuts or excavations on the surface from which so many million dollars' worth of gold-ore has been quarried. Besides the immense open-cuts there are 100 miles of underground workings in the property in the shape of drifts, levels, cross-cuts, etc. The company is producing 1,500,000 tons of ore annually. The ore shows value saved of about \$4 per ton, netting a profit under present methods of treatment of over \$2 per ton.

Stamp-Mills.—In the treatment of gold ores the stamp-mill is not only the simplest, but the cheapest and most efficient method yet devised. It can be built any size the mines warrant from one stamp to a thousand. The most improved pattern has stamps weighing from 1,000 to 1,200 pounds, which are raised by cams from four to six inches, and drop 100 times a minute in mortars. In the larger mills these stamps are arranged in sets of five. The ore is supplied to the top of the mortars by automatic feeders which furnish the exact amount required. The front of the mortars is covered with a strong steel screen perforated so that the finely crushed ore will pass through the screens and out upon the large plates covered with quicksilver. As gold has a great affinity for quicksilver, about 95 per cent. of the free-gold released from the powdered rock will lodge on these plates. The plates are then scraped at intervals, and the scrapings, technically known as "amalgam," melted under great heat in retorts. The quicksilver is driven off by the heat and practically pure gold remains, which is then molded into bars. The process of using cyanide of potassium to extract gold from ore varies in different mills. The general features are the same, the difference being in the details. The ore is first run through heavy rolls which grind it finely enough to pass through a 20-mesh screen. Then the powdered ore is taken automatically by carriers and delivered to iron tanks of large capacity. A weak solution of cyanide of potassium is held in other tanks higher up and is turned in from the bottom of the ore tank. The cyanide percolates up through the ore until the top is covered to a depth of one or two inches. This condition continues from 40 to 72 hours, when all the gold in the ore is dissolved and held in the solution by the cyanide. The solution is then drawn off from the bottom, and as it comes out of the ore tank, runs through a box of very fine zinc shavings. As the contact of the solution with the zinc shavings causes an instant precipitation of all the gold carried, it drops to the bottom of the box.

MINES AND MINING

After the first solution is drawn off the tanks are filled with clear water, which soaks through the pulp. This also passes through boxes containing zinc shavings to save any gold that may remain in the sand—a process which is called "washing out." After the gold has all been extracted the tanks are emptied of the pulp and cleaned up to receive another load. The zinc shavings and gold are taken to the retort room, where the zinc is eliminated and the gold run into bars.

Graphite.—Including the crystalline and the amorphous varieties. The crystalline is largely used in the manufacture of crucibles, lubricants, and lead pencils; and the amorphous in the manufacture of paints, lubricants, and greases.

Gypsum. The hydrous sulphate of lime (calcium), used chiefly in the manufacture of plaster of Paris and as a fertilizer.

Iron Ore.—In different varieties classed as the red and brown hematites, magnetites, and carbonates, which include not alone ore used in the manufacture of pig iron, but also manganese iron ore used in the production of spiegeleisen and the argentiferous manganese iron ore used as a flux in the smelting of ore containing precious metals, and as a "fix" in puddling. The greater portion of the product reported for Colorado is of the latter class. Its precious-metal contents alone are not sufficiently valuable to pay for smelting, but the iron and manganese it contains render it especially valuable as a fluxing medium when mixed with gold and silver ores in the smelter.

Lead and Zinc Ore.—Chiefly the nonauriferous and nonargentiferous lead and zinc ores. See LEAD INDUSTRY

Lithium Ore.—Lithium minerals (Lepidolite and Spodumene) and metal or salts produced from them. The salts are used principally in the preparation of mineral waters and effervescing lithia tablets. The world's annual production of lithium carbonate, which is the principal salt used, is about 100,000 pounds and is mostly manufactured in Germany.

Magnesite.—Magnesium carbonate employed chiefly in the manufacture of magnesite bricks for the refractory lining of furnaces, and the manufacture of carbon-dioxide gas. When crude magnesite is decomposed by sulphuric acid there is a by-product of magnesium sulphate, or Epsom Salts

Manganese Ore.—Used chiefly in the manufacture of Bessemer steel and of chemicals; also of value as a flux. Manganese is not found in a metallic state in nature, but usually occurs as an oxide, carbonate, or silicate in combination with one or more of the other elements. The oxides are the most common of manganese minerals, but Rhodonite and Rhodochrosite—the silicate and the carbonate—are frequently met. The commercially important ores are the oxides

Marl.—Including the green, blue, red, and yellow clayish earths—dug and used as fertilizers, and calcareous marl excavated and used by the manufacturers of cement.

Mica.—Including several varieties—that most commonly found and mined is muscovite. Sheet or plate mica is used chiefly for stoves, chimneys for incandescent lights, and for the insulation of electrical apparatus. Scrap mica is ground to a flour and used in the manufac-

ture of wall papers, lubricants, fireproofing materials, novelties, etc. Scrap mica is prepared by removing the adhering fragments of flint and feldspar and such parts of the mica itself as contain foreign ingredients. For sheet mica the blocks as mined are split into sheets and cut to a size

Mineral Pigments.—Embracing the production of ores in the manufacture of mineral paints, consisting of iron ores (red and brown hematite), which are not included with iron ores used in the manufacture of iron; clay or other earths, containing iron, used in making yellow, red, and brown pigments (such as ochre, umber, sienna, etc.), carbonate of zinc, slate and soapstone used as a pigment. Mineral paints are used chiefly where great resistance to the action of the weather is desired.

Monazite.—Essentially an anhydrous phosphate mined from placer deposits and is of value for its oxides of thorium, cerium, lanthanum, and didymium, which are used in the manufacture of cylindrical hoods for incandescent gas lights. The cerium oxide is also used in small amounts in pharmacy.

Natural Gas and Petroleum.—These are intimately connected in composition and occurrence, one being a gaseous and the other a liquid hydrocarbon, and with but few exceptions they are associated in all of the fields, the gas occupying the upper portion of the same strata which contains the petroleum. In many localities, during cold weather, a small portion of the more volatile naphthas are often condensed from the natural gas and deposited on the pipe lines. Of the combined value of the two, petroleum amounts to a little less than 70 per cent., and the natural gas to a little more than 30 per cent. In combined value they rank next to pig iron and coal in the list of the crude minerals. Petroleum has penetrated every quarter of the globe and is without a rival in its illuminating and lubricating qualities. See NATURAL GAS AND PETROLEUM

Phosphate Rock.—The name phosphate is applied to the salts of phosphoric acid, chiefly orthophosphoric acid, which is a tribasic acid and from which a great variety of salts are obtained. Calcium phosphate, or, more strictly speaking, tricalcium orthophosphate, is the most important of the mineral phosphates, and this class forms the large mineral deposits utilized in the manufacture of fertilizers.

Precious Stones.—Generally found in the United States by accident, or in prospecting for, working, or developing mines of other minerals, or in the working of gravels containing gold, monazite, etc. The companies which carry on the search for stones, with some approach to regularity, produce sapphire, tourmaline, beryl, chrysoprase, opal, and turquoise. In addition to these, certain quantities of emerald, peridot, several varieties of quartz—such as rock-crystal, smoky, rose, gold, and rutiled quartz—amethyst, agate and moss agate, and silicified wood, also garnet (pyrope and rhodolite), amazon stone, chlorastrolite, mesolite, pyrite, anthracite ornaments, and catlinite are produced in this country in varying amounts.

Quicksilver.—Confined in production to California and Texas. It occurs native, but the chief ore from which it is obtained is cinnabar, which is the sulphide. The chief use of mer-

MINES AND MINING

cure is in the metallurgical treatment of gold and silver ores by amalgamation. It is also employed in medicine and in the manufacture of vermilion, a pigment.

Steel-hardening Metals.—Including metals used or experimented with in the hardening of steel, although some of them are used more generally for other purposes. The metals included in this class are nickel, chromium, tungsten, molybdenum, titanium, uranium, and vanadium. The mineral classifications, differing from the metallic here given, are chrome ore (chromium), nickel and cobalt (nickel), and rutile (titanium). There is still another metal that naturally comes under this head, namely, manganese; but on account of its comparatively large production, it is treated separately.

Stone.—Including limestones and dolomites, marble, sandstones and quartzites, silica sand, siliceous crystalline rocks, and slate. Under the classification of siliceous crystalline rocks are included granite, gneiss, mica schist, lava, andesite, syenite, quartz porphyry, trap, basalt, diabase, diorite, and gabbro. Under sandstones and quartzites are included sandstone, calcareous sandstone, bluestone (New York and Pennsylvania), jasper (southern Minnesota), and volcanic lava (Douglas County, Colorado). Under limestones and dolomites are included the limestone used for iron flux and in the manufacture of lime.

Sulphur and Pyrite.—Occurring as an elementary substance and also widely distributed as sulphates and sulphides of many of the other elements. In the crude state sulphur is used for vulcanizing rubber, and in the manufacture of gunpowder and matches; in its refined state it is used in medicine. A small quantity of crude sulphur is used in the manufacture of sulphuric acid, but most of this acid is made from the mineral pyrite.

Talc and Soapstone.—Including a small production of serpentine, and all of the pyrophyllite, mined and used for the same purposes as talc. The name talc has been used commonly and yet erroneously for a number of minerals similar to it in physical properties but mineralogically distinct. The fibrous and foliated varieties, which are the purer forms, are commercially known as talc; while the other material, called soapstone, is a somewhat variable, massive rock in which talc is the principal constituent. The foliated talc is the most valuable, being pure and very free from grit, so it can be used in the manufacture of talcum powders, etc. Occasionally this variety is so compact that tailors' pencils are made from it, in which case it brings the highest price of all. Certain varieties of the massive talc are also pure enough to be used for flour talc, but the greater portion of it is used in the manufacture of soapstone articles. Most of the fibrous talc is obtained from New York, and is used almost exclusively in the manufacture of paper.

Tin.—Very limited in production. Most of the tin of commerce is obtained from the dioxide, called cassiterite by the mineralogist and tinstone by the miner. It is used principally in the manufacture of tin plate (sheet metal coated with tin) and forms a part of several important alloys.

The use of power is becoming more general in all branches of productive industry. In the

mining industries it is employed for a variety of purposes, the chief of which are the operation of hoisting, draining, ventilating, conveying, drilling and cutting machinery, derricks, steam shovels, locomotives and hauling engines. It is also employed extensively in the operation of machinery used in crushing, screening, cleaning, or for otherwise treating the crude material.

Electricity in Mining.—Of late years the electric motor has been utilized for all classes of work—drilling, coal cutting, hoisting, pumping, ventilating, etc., increasing the output of the mine and reducing the cost of production. There are many economies resulting from the general flexibility and applicability of the electric system, making possible the centralization of the power generating plant, the laying out of the mine in the manner most conducive to economical working, the improvement of mine conditions, decrease in the number of men required to operate boilers, engines, pumps, blowers, etc., a reduction in the cost of repairs, the installation of hoists, blowers, or pumps at points where they would otherwise not be used on account of distance from the central power plant, the avoidance of the objectionable exhaust from steam engines, a saving in space requirements for machinery in general; and, finally, the provision of a safe, efficient, and economical means of lighting the mine.

The electric systems suitable for the operation of mining plants are as follows: (1) Direct current for haulage, power, and lighting. (2) Direct current for haulage, and polyphase alternating current for power and lighting. (3) Polyphase alternating current at high potential for power distribution to substations, where it is converted into direct current or to low potential alternating current, or both.

The first system is adapted to mines in which power is not transmitted a great distance. The generating station should contain two or more direct current dynamos connected according to either the two-wire or the three-wire system. If the three-wire system is used, it will be found advantageous to install the Westinghouse three-wire generator, which supplies direct current at two voltages, one twice the other; otherwise it will be necessary to have two machines always in operation, or some more complicated form of balancing apparatus. The three-wire generator can be operated on the three-wire system in connection with other direct current machines of the ordinary two-wire type.

The second system is adapted to the same class of work, but embodies a further advantage, which is particularly important in the case of coal mines. The alternating-current induction motor with revolving secondary of the squirrel cage type has neither brushes, commutator, slip rings, nor other moving contacts, is, therefore, entirely sparkless, and its use involves no danger from explosion or fire. The absence of brushes or commutator is, moreover, an immense advantage where motors are intrusted to the care of unskilled labor and exposed to dust and dirt. The power plant for this system must necessarily contain either a direct-current dynamo to operate the haulage system and an alternator for power and lighting, or a double-current machine which generates both direct and alternating current. If the amount of direct cur-

MINES AND MINING

rent required is relatively small, it may be advantageous to install alternating-current generators with a rotary converter or motor-generator to supply the direct current.

The third system is adapted to those cases where a large number of mines can be operated from one central power station. This plan greatly reduces the number of men required in the power plant, as well as the cost of buildings and apparatus. It also makes possible the utilization of water-power, thus doing away with steam boilers and firemen, and permitting inexpensive water-wheels to be substituted for costly steam engines. By the use of a high voltage, alternating current may be transmitted economically to almost any distance. At the mines it may be transformed into direct or alternating current of a voltage suitable and safe for the operation of mining machinery.

Electric Locomotives.—The saving effected by the use of electric locomotives in mine work is immense. The cost of maintenance is less than with any other system of traction, but the greatest saving, as compared with either animal or mechanical haulage, is in the cost of attendance. The compactness of the electric locomotive makes it perfectly adaptable to low and narrow entries. There are no moving parts exposed to external injury; the mechanism is of the simplest character and the running parts are easily accessible. It may be used upon temporary tracks and in crooked passageways where the installation of a rope-haul system would be impracticable. An electric locomotive may also be used to distribute the cars to room partings, work which with a rope system would require extra men and mules. For the hauling of slag to the dump it is the most economical and serviceable motor power.

Compared with the compressed-air locomotive, the electric locomotive shows a considerable saving in the cost of plant maintenance. The compressing station may be fairly set off against the generating station, except in the matter of power efficiency, in which the latter has a marked superiority. In respect to transmission, the compressed-air system is also decidedly inferior. The pipe lines are costly and hard to keep tight. They are easily corroded by the acid waters present in mines. In some instances it has been found necessary to renew the pipe lines as often as once every year, at great expense and delay. The compressed-air locomotive itself must be idle a considerable portion of the time while charging and with its immense air-tanks it is generally an unwieldy affair. It should also be remembered that the adoption of the compressed-air locomotive implies either the loss of the many advantages of electric power in other directions, or else an expensive duplication of plant.

Electric Hoists.—The great utility of the electric hoist in mining work is due to the ease with which the electric motor can be controlled and to the fact that an electric hoist equipment requires little space and may be installed wherever needed. Electric distribution does away with many small boilers and engines, permitting the power plant to be consolidated under one roof. The types of motors most suitable for hoisting work are the direct-current series and compound-wound motors, and the alternating-current induction motor. The series motor is

valuable if a very high starting torque is desirable, but close speed regulation is not required. If there is any possibility that the motor might race the compound-wound motor should be used. The compound-wound motor has the high starting torque of the series motor, but resembles the shunt motor in that it will not exceed a certain speed when the load is thrown off. A controller suitable for motors of this class consists of an iron box containing resistance, a commutator composed of a number of contact blocks, each of which is connected to the resistance at a suitable point, and a set of brushes mounted on a rocker arm. The direction of rotation of the motor depends upon the direction in which the controller handle is moved from the neutral point.

Compressed Air.—In many mines where electric-power distribution has been adopted, compressed air is still employed for the operation of small tools, drills, and coal cutters. In such cases, electric motors are used to drive the air compressors, which, in consequence, may be placed conveniently near the point of application of the air, thus avoiding long and complicated systems of piping. Both pumps and compressors require a practically constant torque, or turning moment, in the motor. The speed variation demanded is usually small. If power distribution is by direct current motors should generally be compound wound, and, if necessary, the speed may be varied by means of a rheostat in the shunt field. The series winding prevents the heavy fluctuations of current that would take place in a simple shunt motor when passing through the different parts of the pump cycle. Where hydraulic pumps supply a long line of pipes, a series winding on the motor easily furnishes the heavy torque required for starting. See AIR COMPRESSORS; COMPRESSED AIR.

Electric Motors.—For the operation of fans and blowers, the electric motor has unequalled advantages. When properly constructed and installed it requires little attention and runs continuously day in and day out with only occasional cleaning and oiling. This point is especially important since it is often desirable to locate ventilating fans at unfrequented points and at considerable distances from the powerhouse. A point which sometimes may be of considerable importance where a large number of motors are located at widely separated points throughout a mine is that the alternating-current induction motor and the direct-current series and compound motors will start and stop with the starting and shutting down of the main generators in the power-house. If by reason of an accident or other cause the current supply is stopped all the fans and other machinery in the mine may be started again promptly when the power is turned on without visiting the different points where the apparatus is located. This is a feature which might be of great importance in many instances. It is possible to start and stop the induction motor at any time from any distant point by simply opening or closing the main circuit. The series and compound motors may also be controlled easily from a distance.

In placer as well as in lode mining, electric power may be employed advantageously for pumping and for hoisting either direct or by derrick. It is essentially applicable to dredging apparatus, since it admits of the operation of

MINES AND MINING

dredges where fuel is hard to obtain or expensive and makes possible the carrying on of the work at night.

Compressed-Air Mining Machinery.—Notwithstanding the widespread use of electricity in mine applications involving power, compressed air has many advantages in certain situations. In coal mining it is extensively employed. Fan engines, pumps, etc., can be driven with air without condensation losses, without trouble from dampness, and without fire risks, in connection with the machinery already in place, and perfectly understood by present employees or other labor obtainable anywhere. Rock shafts, rock roofs, tunnels and floors can be reduced to a power basis with great saving in time and cost. Air assists ventilation everywhere, clears away the smoke at once from a room or entry which must be pushed, drains the low spots, or pumps the heaviest floods with common pumps, requiring no more skilful handling than the most careless boy about the works is equal to, and all this beyond the possibility of being drowned out. Blacksmith fires and steam hammers are operated at the touch of the foot. Ventilation is assured in remote places, in case of a choked airway, or any restricted place. The air lines are laid throughout the mine, and the engine-room may be equipped with a powerful fire pump. Each air hose may then be used to carry a strong stream of water to the coal face at need, a pipe line being a factor of safety and not of risk. Compressed air, like electricity, has seen the time when, not being understood, it has been applied wastefully. Air is merely a transmitter of power, just as electricity or a wire rope is; but, correctly used, it is inherently economical, being practically a perfect gas. Important developments are continually being made, and the future promises much in the advancement of compressed-air appliances. See MINING AND MILLING MACHINERY.

Signaling in Mines.—Effective signaling in mines requires a great variety of apparatus, such as telephones, telegraphs, bells, and appliances for sending signals according to the indications upon a dial. Of late years the telephone has advanced beyond other methods of signaling, and special types of instruments, intended for mining work, are made with regard to conditions of exposure, damp, etc. It is generally recommended that telephones be put in all permanently installed motor-rooms, so as to enable the men in charge underground to inform the engineer at once of any breakdown of motors, machinery, etc., and, if necessary, obtain assistance speedily.

Ventilation and Drainage.—In the development and operation of extensive mining enterprises, ventilation and drainage are in many instances a source of expense and cause of numerous difficulties. The cumbersome and expensive Cornish pump system of mine drainage has in late years been largely displaced by modern steam, electric or hydraulic pumping engines, which have a greater efficiency and greatly decreased expense in first cost, as well as in operating expense. The method of mine drainage by means of automatically operated skips has also been improved, and in some instances this method of mine drainage is preferred to any other mechanical means, though where the amount of water to be handled daily is very

large a special shaft and hoisting equipment is desirable, if not necessary, in order to admit of the product of the mine as well as materials and men being handled. The means of ventilation have also been improved over old practice by the introduction of large and better ventilating fans and reversible current devices. Although these much desired improvements have been made in the mechanical devices for handling water and for ventilating the workings, the method par excellence for both drainage and ventilation is by means of tunnels.

Tunnels.—In many mining localities long tunnels are justified by the character and value of the mineral resources of the district. Not tunnels a few hundred, or a few thousand feet only in length, run for the development and drainage of an individual property, or a restricted group, but tunnels run for the benefit of whole districts. In the State of Colorado, in Idaho, in some portions of California and Arizona, and also in Utah, as well as in other regions, tunnel schemes of this character are possible, which would drain and ventilate all mines connecting with the main tunnel, and afford an economical means for transportation of all the ores of the mines tributary to such adits. In some districts such tunnels have been run, and in almost every instance the result has proven the wisdom of the protectors of these enterprises. Such operations as these require large capital and energy behind them to push the enterprise to a completion as quickly as possible, as this is the only proper way in which to handle mining propositions of this magnitude and character. In a district of superficially developed mines—down 1,000 feet or less—where there are large bodies of profitable ore, it is the usual experience to find the values, if not decreasing with depth, to be associated with new combinations, and unfortunately it is usually the case that the change in character of the ore necessitates a change in treatment with an increased expense per ton on that account. With increasing depth also comes additional expense for hoisting, ventilating and drainage, and not infrequently of labor as well, for the reason that miners cannot break ground as cheaply under the increasing difficulties and disadvantages as they can nearer the surface. All of these disadvantages the drainage and transportation tunnel minimizes with decreased cost.

System of Mine Ventilation.—In a system of mine ventilation recently proposed and approved for its practicability an air compression furnishes fresh air under pressure to the main supply pipe line, which pipe for convenience is placed in a pipe of larger diameter, this larger pipe leading to an exhaustor or another air compressor, the purpose of which is to draw the impure air out of the mine, at or near the working faces, and discharge it into the atmosphere. These main lines are preferably placed on the surface of the ground (or slightly below the surface in a box or trench) parallel with, or just over the main entry, and are connected at intervals with vertical pipes of lesser diameter, said vertical pipes leading through the roof of entries or to one side, or, so as to not interfere with the other mine equipment. The suction or exhaust pipe opens at, or near, the roof of the room or entry and the supply pipes lead lower down and at the sides where hose connections

MINES AND MINING—MINING AND MILLING MACHINERY

or horizontal branch supply pipes can be added so that the live air can be applied at or near the face of the workings to jet away the noxious gases or drive them into the main air courses in case a fan is also used. The cost of installation of this system will, of course, depend upon local conditions. Separate air courses are not required; their construction would be much greater than the cost of the compressor and pipes and cost for drilling the vertical holes. A mine using compressed air as a motive power could utilize the supply lines for transmitting their power to good advantage for the friction losses are apt to be considerably reduced by the use of larger diameter pipes of shorter lengths.

The large and ever-increasing consumptive power of the United States and other countries has caused a phenomenal growth in the mining industry during recent years. With splendid modern transportation facilities, numerous inventions and perfections in machinery, new discoveries in electricity and motive powers, and the many advantages at the command of the United States, the further development of her mining industries simply awaits the vigorous hand of her bold and enterprising manhood. See **AMERICAN MINES AND MINING**.

EDWARD S. FARROW,

Consulting Railroad and Mining Engineer.

Mines and Mining, Law of. By United States law public mineral lands, both surveyed and unsurveyed, are open to free explorations, of opening and developing mines, on the conditions established by Congress. A mine located by a compliance with those conditions is the property of the locator, and he may lease, assign and convey it, giving a valid title. The owner of the soil may convey the mineral rights in a distinct grant, and thereby create one freehold in the soil and another in the mines, and each estate is entirely independent of the other, capable of being conveyed or inherited. The purchaser of a mineral right has, as an incident of his purchase, the right to open as many tunnels and shafts in the soil as are necessary to a convenient and complete operation of his property, to deposit the earth excavated upon the premises, erect suitable machinery and buildings, have free ingress and egress, and is responsible to the owner of the soil for abuse of his privilege only. See **MINING LAW**.

Miniature Painting, or the painting of portraits on a small scale, originated in the practice of embellishing manuscript books. The art of illumination was expressed by the Low Latin verb *miniare*, and the term *miniatura* was applied to the small pictures introduced. After the invention of printing and engraving this delicate art entered on a new phase; copies in small dimensions of celebrated pictures came to be in considerable request, and, in particular, there arose such a demand for miniature-portraits that a miniature in popular language came to signify "a very small portrait." The early artists painted on vellum and used body-colors—that is, colors mixed with white or other opaque pigments, and this practice was continued till a comparatively late period, when thin leaves of ivory fixed on card-board with gum were substituted. After ivory was substituted for vellum, transparent colors were employed on faces, hands, and other

delicate portions of the picture, the opaque colors being only used in draperies and the like; but during the 19th century, the practice has been to execute the entire work except the high lights in white drapery with transparent colors.

Min'im Friars and Min'im Nuns, an order instituted in the middle of the 15th century, and more correctly designated Min'im-Hermits of Francis of Paula. They observe perpetual abstinence. The object of the order is both contemplative and active. They belong to the mendicant orders, and possessed, in 1900, several hundred convents.

Min'imum Thermometer. See **THERMOMETER**.

Mining. See **AMERICAN MINES**, **MINES AND MINING**; **MINING AND MILLING MACHINERY**; **MINES AND MINING, LAW OF**; **MINING ENGINEERING**; **MINES, DRAINAGE OF**; **COAL MINING**; **GOLD MINING**, ETC.

Mining and Milling Machinery. Problems in mining may be classified into groups according to their relation to geology, engineering, machinery, and metallurgy; but, as the problems of each group overlap to some extent those of the others, the special consideration of the subject of mining machinery necessarily involves a general consideration of mining methods and results in their geological, engineering, and metallurgical aspects.

Mining methods differ according to the form and geological relations of the mass of ore or other minerals to obtain which the mining operations are instituted. These relations outline two general methods—those applicable to "surface deposits," and the more complicated methods required in the working of "underground deposits."

Surface deposits are those in which the mass of ore is of considerable superficial extent and lies on or near the surface of the ground. The first step in this case is to uncover the ore by "stripping" off the overlying worthless material called the "burden." If this consists of soft earth or gravel it may be removed with pick, shovel, and wheelbarrow, or by the use of steam-shovels, and small tram-cars drawn by horses, mules, or locomotives. If the burden is too hard to be stripped by any of these methods, blasting operations are usually employed. The burden is first blasted off and removed, and the subsequent work of extracting the mineral thus exposed is carried on by benches or terraces along the hill-side, so that the cuts will naturally drain into the pit, and the ore will have a favorable grade for its transportation in removal. If the pit is located in level or depressed ground, the use of pumping machinery will become immediately necessary, entailing a heavy expense at the very beginning of the operations. Open cuts are the simplest and most convenient form of excavation, but they expose the men and machinery to the weather, and usually necessitate the abandonment of all operations during the winter. Another method of surface mining consists in the employment of water jets for working auriferous gravels. This is technically known as "hydraulic mining." Water conducted from great distances and elevations is directed against the ore-bearing gravel banks and beds, in the form of powerful jets through large nozzles called "giants." The impact of the water under

MINING AND MILLING MACHINERY

the great pressure due to its heavy fall washes away the gravelly material of the banks with almost incredible rapidity through sluices where the gold is separated from the sand and gravel by amalgamation with the mercury in the riffles of the sluice boxes. The sluices usually consist of a series of 12-foot troughs which empty into one another and often form a line of troughs several hundred feet long. The bottoms of the troughs have corrugations called riffles, and are cut out at intervals and replaced by a grating called a "grizzly." Under the grizzly another broad trough is placed at right angles to the top trough, and empties into another trough which runs parallel to the direction of the top trough and forms the continuation of the main sluice. As the material of the bank is washed through the sluice boxes by a strong stream of water, the sand and gravel is caught by the grizzly while the gold passes through into the lower trough where it amalgamates with the mercury which is frequently sprinkled into the riffles.

Underground deposits are worked by the use of shafts and tunnels driven through the overlying earth and rock into the "lodes" or veins of ore. In these operations the overlying rock is always supported in place over those portions of the mines where the borings are used as passage-ways, and the arrangements for ventilation are more and more carefully made as the workings grow deeper and deeper.

The material thus obtained is prepared by the process of "ore dressing" for the subsequent processes of extraction.

Ore dressing consists of two processes—crushing and separation, which employ two distinct types of machinery.

By crushing, the material is broken up into coarse fragments, or ground into a fine powder, and the valuable ore detached from the worthless rock.

By separation, the valuable ore is concentrated into smaller bulk and weight by being separated from the waste, or in the case of two valuable ores, they are separated from one another.

The selection of the particular types of crushing and grinding machinery is always determined by the character of the ore and the process of extraction for which the ore is prepared.

The processes of extraction may be briefly defined as follows: (1) Smelting processes in which the pure metal is extracted from its ore by fire; (2) amalgamation process in which the metal forms an amalgam with mercury from which it is subsequently separated by the distillation of the latter; (3) chemical processes in which the metal is dissolved by various solutions and then precipitated in solid form by suitable precipitants; (4) electrolytic processes in which the extraction is accomplished by electrolysis.

The crushing and grinding machinery used in mining consists of the following classes of machines:

Rolls.—These are the standard machines for crushing brittle ores which are being prepared for concentration except where fine crushing is required.

Steam stamps are the standard machines for crushing ores containing native copper.

Gravity stamps are the machines most extensively used for fine crushing.

Ball mills are also quite extensively used for fine crushing, and are the most efficient competitors of the gravity stamps.

Pulverizers are used for crushing and grinding ore as it comes from the crusher or rolls, for fine concentration, or for the recrushing of middlings and tailings from jigs for subsequent treatment on concentrating tables or other concentrating machines.

The preliminary crushing is usually accomplished by jaw or gyratory crushers and then the material is passed over to the rolls, stamps, or ball mills. The selection of screens having the proper mesh to crush through is one of the most important details. For purposes of concentration it is usually advantageous to begin by crushing to a coarse size, separating as much of the waste as possible, then recrushing to a finer size and again separating the waste. In crushing gold ores for subsequent treatment by the cyanide process, fine crushing gives a higher extraction than coarse crushing, but it also produces more "slime." Slime is material reduced to an impalpable powder, which when wet becomes plastic, and forms into impervious layers in the tanks, so that the solution is prevented in passing through. It is the most discouraging material against which the cyanide operator has to contend.

The following examples have been selected to illustrate the various classes of these machines:

Fig. 1 shows a general view of a Blake Crusher, a machine of the "jaw-crusher" type.

Fig. 1. Blake Crusher.

They are made in dimensions which provide a capacity of receiving rocks ranging from $1\frac{1}{2} \times 3$ ", to 15×24 " in size, which they reduce to fragments ranging from 1" to 3" in size, at the rate of 15 to 250 tons per 10 hours of work, according to the size of the machines.

They range in power from $\frac{1}{2}$ horse-power in those weighing 1,000 pounds, to 25 horse-power in those weighing 26,000 pounds, and require a speed of 225 to 250 revolutions per minute for their operation.

MINING AND MILLING MACHINERY

Fig. 2 shows a general view of an Austin Gyratory Rock Breaker. It represents one of

only to abnormal strains caused by the accidental passage through the rolls of hard uncrushable substances such as broken drill points, etc. The rolls may be adjusted to a nicety by screwing or unscrewing the nuts on the adjusting bolts, which are attached by a "key colter" to the movable journal and are held in place by lock nuts which rest against the heavy brackets cast on the main frame. The roll shafts are made of the best hammered steel; their bearings are made of phosphor bronze; and the crushing shells are made of the best quality of steel $4\frac{1}{2}$ inches in thickness.

The size of rolls ranges from $24" \times 15"$ to $60" \times 24"$, and ranges in weight from 14,000 to 60,000 pounds. Their operative speed ranges from 100 revolutions per minute for the larger, and from 100 to 175 revolutions per minute for the smaller machines.

Fig. 4 shows an Allis-Chalmers steam stamp designed for the reduction of copper ores. This

Fig. 2. Austin Gyratory Crusher.

the strongest and most durable of this class of crushers. It is made in sizes which have receiving openings ranging from $4" \times 5"$ to $18" \times 63"$, and have reduction capacities ranging from 2 to 200 tons per hour, according to the size to which the material is reduced and the size of the machine. In weight they range from 3,000 to 100,000 pounds, and require from 4 to 150 horsepower to drive them at speeds ranging from 350 to 500 revolutions per minute.

Fig. 3 shows a general view of a set of Crushing Rolls. It consists of a set of stationary and a set of movable rolls; an automatic feed hopper built in sections, so that the wearing parts may be easily replaced; a dust cover; and two, extra heavy, band wheels for the driv-

Fig. 3. Crushing Rolls.

ing belts. The main frame and the journals for the stationary rolls are cast in one piece. The movable journal is held in the centre of the main frame by means of a heavy steel shaft, and the swinging journals are held in place by tension rods which are attached to nests of powerful coiled springs between washers on the rods. These springs are stiff enough to resist the pressure imposed upon them by ordinary crushing without being compressed, and yield

Fig. 4. Allis-Chalmers Steam Stamp.

stamp is driven by a vertical steam cylinder with valve gearing arranged to keep the steam-port freely open during the downward stroke, thus adding the power of the steam to the weight of the stamp. The mortar has four discharge screens and rests on a heavy anvil or bed plate, and is held in place by angle guide pieces cast upon the massive framing of iron columns. The upper and lower guides for the stamp-stem are detachable bronze bushings in which the stem is slowly revolved by a horizontal pulley on a sleeve between the upper and lower guide brackets. The sleeve contains two feathers which fit into corresponding slots in the stamp-stem, by which the latter is rotated. The steel

MINING AND MILLING MACHINERY

piston-rod is connected to the stamp-stem by a circular disk which is encased in a cast-iron bonnet bolted to the flange of the stem, the space between being filled with pure gum-rubber packing, so as to relieve the shock on the piston and to permit its removal for repairs without dis-

stamp battery operating gravity stamps. The screen and a portion of one of the sectional mortars is removed so as to reveal the stamps and the dies. Fig. 6 shows a sectional view of the same battery, with automatic feeders in place. From the ore bin down to the stamp die within the mortar the various devices and their movable parts, which comprise the battery, are illustrated by the following figures. Fig. 7, ore-bin gate and spout. These are built in sizes

Fig. 5. Ten-Stamp Battery.

turbing the stamp. These stamps have a capacity of several hundred tons per day. Other forms used chiefly on copper ores are the Kraus

Fig. 7. Ore-bin Gate.

ranging from 18 to 24 inches, or in special sizes as may be required. Fig. 8, a "Challenge" ore-feeder. This is an automatic arrangement

Fig. 6.

Atmospheric Stamp, and the Tremain Steam Stamp.

Fig. 5 shows the general aspect of a ten-

Fig. 8. "Challenge" Ore-feeder.

which may be used with wet or dry ores. Its operation is simple and regular: The cast-iron

MINING AND MILLING MACHINERY

plate placed at an angle below the hopper is rotated by bevel gears actuated by a friction device in the shape of a tappet-rod or forked lever, which engages a feed collar placed on the central stem of the battery. The entire apparatus is about 4½ feet in height, 3 feet 9 inches in width, and weighs about 845 pounds. Other types of feeders are the "movable suspended," and the "fixed suspended," automatic feeders. The principal advantage of using the suspended type of feeder is, that it gives an unobstructed floor space behind the battery, and thereby facilitates the work of "clean up," repairs, etc. When they are used for feeding "Huntington" Mills or other pulverizing mills, they are usually arranged to be driven by belting.

Mortars are made in a great variety of forms, and are designed for both wet and dry crushing. Fig. 9 is an example of the deep single discharge type, designed for copper lining plates in the back and front, the former bolted through the mortar, and the latter attached to a block under the screen frame. The ore is fed through the opening in the back near the top and is distributed under the stamps by their own action, peculiar to the order of their drop. The water enters at the top against each stamp and carries the crushed ore or "pulp" through the screen as fast as it becomes fine enough, by being

Fig. 9.

dashed up against the screens by the falling stamp. Amalgamation takes place within the mortar by the pulp being splashed up on the copper lining plates. Fig. 10 is an example of a deep straight-back mortar not provided with copper lining plates, amalgamation being affected by outside means. It is provided with steel liners, and a steel wearing plate, and is so proportioned that it affords unusual facilities for the quick discharge of the pulp through the screen. Fig. 11 illustrates a double-discharge mortar designed for use in wet crushing silver, in concentrating or in combination mills where large crushing capacity is desired. The pulp discharged through the back screen flows toward the centre at the back of the mortar, and passing through an opening in the base of the mortar proper, joins the pulp from the front screen. Fig. 12 is an example of the mortars designed for dry crushing. All of them are made double-discharge, with the dies so placed that the dry pulp will easily reach the screens when it is dashed up against them by the action of the stamps. A peculiar feature is the fastening of the die by a dove-tail flange at the bottom.

Fig. 10.

Fig. 13 illustrates a general view and cross-section of a sectional mortar. Its construction in

Fig. 12.

Fig. 11.

sections adapts it for mule-back transportation in mountainous countries.

Fig. 13.

It is important to note in this connection that the capacity of a battery of stamps depends very largely upon the construction of the motors used.

Battery or Mortar Screens are usually made of genuine Russia iron, or of the best quality of cold rolled homogeneous steel. They are of various patterns—"roundhole screens" with perforations ranging from ¼ to 1 millimeter in diameter; "needle slot screens" perforated with diagonal or horizontal slots usually 15/32

Fig. 14. Perforated-iron Screens.

of an inch in length, and ranging from 12 to 70 mesh; and "indented-slot screens." Fig. 14 illustrates an example of each type. In addition to these regular patterns, most of the large manufacturers are always prepared to furnish screens punched according to any specifications

MINING AND MILLING MACHINERY

that may be submitted as may be required for use with particular ores.

Stamp dies are made of very hard and tough material, usually the same as that used for the

pressed against the stem by cross keys behind, binds the tappet on the stem as firmly as possible, and at the same time admits of a quick adjustment to another portion of the stem when-

Fig. 15.

body of the shoe. Fig. 15 shows six of the principal forms.

Stamp-shoes are made in a variety of regular and special patterns. Fig. 16 shows one of the usual patterns. In wet crushing mills it is attached to the stamp-head by means of strips of wood placed in the space between the neck of the shoe and the socket of the head. The wooden strips are swelled by the water and thus hold the shoe and head firmly together. In dry crushing mills strips of iron are used for this purpose.

Fig. 16.

Fig. 17.

Stamp-heads are made the same diameter as the stamp shoes. As shown by Fig. 17, the stamp-head has a tapering socket at each end—

Fig. 18.

the lower for the neck of the shoe, and the upper for the tapering end of the stamp-stem, which requires no other fastening than the wedging action of its taper to bind it firmly to the head. Slots are cut from the outside of the head into the sockets, through which by means of wedges the stem and the shoe can be forced out when necessary.

The tappets are collars fastened to the stamp-stems. They bear against the revolving cams and thus alternately lift and drop the stamps. Each tappet is fitted with a gib which being

ever necessary. As shown by Fig. 18, they are made with either two or three keys, and are counterbored to prevent slipping on the stem.

Cams are being made in a variety of patterns depending upon the height the stem is lifted and dropped, and the necessary distance between the centre of the cam-shaft and the centre of the stamp-stem. They are made both right-handed and left-handed, and are either keyed onto the cam-shaft, or attached by means of taper-bush-

Fig. 19. Cams.

ings which give a self-tightening effect. Fig. 19 shows side and edge views of both types, and the method of applying the taper-bushings.

Fig. 20 shows their positions on the cam-shaft so as to give the most general order of a drop for a ten-stamp battery, when driven from either end of the shaft.

The other essential parts of the battery are the "cam-shaft boxes," "cam-shaft pulley," and the "stamp guides." These are illustrated by Figs. 21, 22, 23, respectively. The cam-shaft boxes are made of metal and in the improved forms are provided with an oil drip launder

MINING AND MILLING MACHINERY

which extends around the two ends and the front of the box and thus prevents the lubricat-

Fig. 20.

ing grease from dripping into the mortar and onto the amalgamating plates. Standard cam-

a mean space of six inches at rates ranging from 105 to 110 drops per minute. Their crushing capacity ranges from 6 to 40 tons for 24 hours according to the milling quality of the ore.

Ball Mills.—These are used for the purpose of reducing ores from lump form down to 30

Fig. 21.

and 40 mesh. Fig. 24 is an example of the general type.

Pulverisers.—Perhaps the best representatives of this class of machines are the "Huntington" and the "Chilian" mills. Fig. 25 shows a general view of a Huntington mill of the latest

Fig. 24. Ball-mill.

Fig. 23.

sides are turned and thoroughly covered with oil paint. The hub is of cast iron, the through sleeve and one flange being cast in one piece. The sleeve is bored to fit the cam-shaft and turned and key-seated to receive the following flange, the two flanges being bolted together with through bolts.

The stamp guides are made of wood; wood bushings in iron frames; or entirely of iron. They are made either solid or sectional, the latter form being preferable as a considerable saving in time can be effected by their use, especially when the guides require dressing down.

The stamps range from 840 to 1,200 pounds in weight each, and are usually operated through

Fig. 25. Huntington Mill.

pattern. In operation, the ore and water fed into the mill through the hopper is thrown by the rotating rollers and scrapers against the ring-die where it is crushed to any degree of fineness desired, by the centrifugal force of the rollers as they roll over it. The water and pulverized ore are thrown against the screens through which they are discharged when ground sufficiently fine to pass the mesh, which ranges in fineness from 60 to 120. Very little slime results from the operation, and the pulp or pulverized ore is delivered in good condition for concentration. The rollers are suspended so as to leave a space of about one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and the amalgam without grinding it or throwing it from the mill, while at the same time the agitation of the pulp is sufficient to make amalgamation perfect.

They are built in sizes ranging from three and a half to six feet in diameter, and from 7,000 to 44,500 pounds in weight. They require from 5 to 15 horse-power to drive them at pulley speeds ranging from 120 to 150 revolutions per minute, to give capacities ranging from 10 to 75 tons of ore for 24 hours.

Mining Engineering

The principal machinery used in the processes of separation are of the following classes:

Preliminary Washers, which are employed for the purpose of disintegrating and floating off the adhering fine clayey substances from the coarse particles, by the use of running water aided by some form of stirring device.

Sieves and Screens are used for separating the finer from the coarser particles of ore. They are of two classes, (1) "stationary screens," which include the wire-cloth gravel screens, and the perforated plate screens, and (2) "moving screens," which include the oscillating bar screens, the plain shaking screens or riddles, and the revolving screens or trommels.

Classifiers are used for obtaining a series of products of diminishing size by means of currents of water.

When the process of separation is accomplished by "hand-picking" methods, the work of

consideration of the qualifications, professional duties and training of the mining engineer; the subjects relating to mining as an art, namely, the modes of searching or prospecting for mineral deposits, the various systems or methods of working mines, and the details of the operations connected therewith, are dealt with under the head of Mining.

The province of the mining engineer comprises the testing and valuing of mineral deposits, the planning and execution of the various mining works required to reach the deposit—such as tunneling, shaft-sinking, etc.—the choice and application of a suitable method of opening the mine and bringing the ore to the surface; and lastly, the installation of the necessary surface and underground plant. In addition, therefore, to a knowledge of the theory and practice of the various kinds and methods of mining, the successful pursuit of the profession demands not only a training in mathematics, mechanics, physics, and other fundamental subjects which underlie all technical education, but also an intimate acquaintance with certain of the natural sciences, particularly geology, mineralogy and chemistry, and many of the principles of civil, mechanical, and electrical engineering. In a well-planned course of professional instruction the scientific studies would preferably come first, but the engineer is incomplete until to these is added a knowledge of the actual practice of mining. The arts of metallurgy, ore-dressing, and milling, moreover, are so related to the art of mining that these subjects also, at least in part, must be included in the equipment of the mining engineer. The functions of the mining engineer cannot be defined in precise terms, largely because of the infinite variety of local conditions which may be encountered, and the differing physical, mineralogical, and chemical characteristics of the ore deposits themselves. (See ORE DEPOSITS.) There has been perhaps a greater tendency toward specialization in mining than in other departments of engineering. As the professional field has broadened, no one man can hope successfully to cover it all. Quite a sharp distinction exists, for example, between metal mining and coal mining. The modes of deposition of coal and of the metalliferous ores, the geological and physical conditions, and the accepted systems of mining, are so different that the engineering of collieries has become largely a specialty. So again among the metals themselves. Engineers may be led to specialize in the direction of iron, or lead and zinc, or copper, or gold and silver mining. This latter differentiation is not the result of any fundamental diversity in the methods of developing and working the mines, but is due rather to differences in the scale of operation, the physical characteristics of the deposits themselves, the treatment of the ores of the various metals and their final disposition. It frequently happens that the dressing, or concentration, and even the smelting, or other process for the reduction of the ore, are carried on at or near the mine itself, and under the same general management. The mining engineer, therefore, must be something of a metallurgist also, and though not necessarily highly skilled in this direction, he should at least be able to decide upon and select the plant and process appropriate to the character of the ore, and to supervise its erection and

Fig. 26. Ore-grizzly.

separating the valuable ore from the waste material is usually done on "tables," of which there are at least five classes in general use: (1) Stationary horizontal tables; (2) stationary sloping chutes; (3) shaking tables; (4) belt, rope, or plate conveyors, and (5) revolving circular tables.

Other methods of separation employ "hydraulic jigs," which perform their work through the alternating upward and downward action of two currents of water upon a bed of sand supported by a screen; "vanners" or endless belts which are shaken rapidly either endwise or side-wise, and have a continuous slow motion up hill; "bumping tables"; "film sizing tables," and various forms of magnetic separators.

Fig. 26 shows an ore grizzly, which represents the various forms of metal bar screens.

WILLIAM MOREY, JR., C. E.,
Consulting Civil and Mechanical Engineer, New York.

Mining Engineering, that branch of engineering which pertains to the operations of extracting useful minerals from the deposits in which they occur. While no distinct line can be drawn between the fields occupied by mining and mining engineering, the former may be termed the art and the latter the science of mining. The present article will be confined to a

MINING ENGINEERING

operation. But this view applies chiefly to the mining and treatment of the non-ferrous metals. The metallurgy of iron and steel forms far too large a field to be included in the range of work of the mining engineer. It requires a special training, and has itself developed practically into a distinct profession.

Several more or less conventional distinctions are made as to the particular branch of work in which a mining engineer may specialize. He may devote himself to examining, valuing and reporting on mines, being engaged for such work by intending sellers or buyers, he may serve in the capacity of consulting engineer for one or more mining companies; or in doing a general business he may be retained by his clients in an advisory capacity similar to that occupied by a counsellor-at-law, leaving to others the actual execution of the work or the carrying out of the policy determined upon. On the other hand, a mining engineer who becomes identified with the management of the affairs of a particular company must be a successful organizer and business man; he must possess the ability to make favorable contracts for work, the purchase of material and disposal of product, to control men, and not only to plan work but to know how it should be executed to attain the best economic results. He often combines with his purely professional functions the duties of superintendent or manager, and the smaller the property, the greater usually is the variety of responsibility devolving upon the engineer. When in charge of a small or temporarily non-paying mine, especially one situated in a remote region, the engineer may be compelled to serve simultaneously in the capacities of superintendent, foreman, assayer and book-keeper. He must know enough of chemistry and of civil, mechanical and electrical engineering, to exercise intelligent control in matters relating to these branches, and he should have at least a general knowledge of mining law.

Formerly, the profession of mining engineering was less complex and exacting in its requirements than at the present time. The great advances made during the past 35 years in scientific and technical lines have brought with them constantly increasing responsibilities. An inspection of the course of study prescribed in mining schools of good standing will show how largely the education of a student in mining engineering lies in the direction of subjects not relating specifically to the art of mining itself. Manual labor has been more and more replaced by mechanical appliances, and the engineer must keep abreast of the times by alertness in availing himself of the innovations which have been introduced in endless variety, the ever widening applications of electricity and compressed air for the transmission of power, the numerous improvements in the machines and processes for the concentration and reduction of ores, the increase in knowledge of the relations of geology to the deposition of ores; all these constitute new tools in the hands of the mining engineer, but they unite also in demanding a broader and more severe training. Up to 1870 applications of electricity and compressed air to mining were practically unknown; now they are employed in nearly all departments of mine work. Compressed air rock drills are used everywhere for both surface and underground excavation of

rock; electric drills are rapidly gaining in favor; electric and compressed air locomotives or rope haulage have largely superseded hand tramping and haulage by mules and horses, wherever the quantity of material dealt with is sufficient to warrant the additional first cost of plant; the greatly increased depths at which mining is carried on in many districts have made necessary the design and erection of enormously powerful and complicated hoisting engines; and finally, the successful and economical operation of such plants requires the maintenance of well equipped machine and other repair shops.

The question of hoisting large quantities of ore from great depths, that is, vertical depths of say more than 5,000 feet, is one of the most serious mechanical problems at present confronting the mining engineer. Depths of approximately 5,000 feet have been already attained in several mining districts, notably in the Lake Superior copper region, the Witwatersrand in South Africa and elsewhere, while in the Butte, Mont., copper district, the silver mines of the Comstock Lode, Nevada, and the Bendigo gold fields of Victoria, Australia, depths of 3,000 to 3,500 feet have been or are being reached. In a number of places where the present maximum depth of shaft does not exceed 3,000 feet, elaborate engines capable of hoisting from 5,000 feet or more have been installed. The prosecution of work at such depths involves the solution of rather intricate problems, among which are: the proper construction of hoisting drums for winding the great lengths and weights of rope required, the design of reliable controlling apparatus for hoisting at speeds of 3,000, 4,000 or even 5,000 feet per minute, the means of raising and lowering with safety, speed and economy the hundreds of men required in large and deep mines, and the difficulties involved in the varying weight of the rope itself, as it winds upon its drum, a weight which often greatly exceeds that of the ore raised at each hoisting operation. A high degree of mechanical skill and knowledge is demanded for the effective solution of these and other problems, some of which have only recently presented themselves (*vide* the discussions on 'Hoisting from Great Depths,' which have appeared during 1902 and 1903 in the 'Transactions of the Institution of Mining and Metallurgy,' London, the South African Association of Engineers, and the 'Engineering and Mining Journal,' New York).

In all branches of his work the mining engineer of the present day finds himself compelled to introduce every new method and appliance that promises some saving in the cost of production. This is the direct result, not only of competition, but of the great reduction in market price of nearly all of the metals within the past three decades. In 1873 the price of silver was \$1.30 per ounce; now it is 58c; copper was then worth 30c per pound, now 12c; lead was then 6½c per pound, now 4½c, and other similar examples of the decline in value of the staple metals can be cited. Furthermore, as the more easily accessible mineral deposits are exhausted, the mining engineer is called on to practise his profession farther afield, often in regions remote from centres of population. Here he may be confronted with new problems arising from the lack of transport facilities, dis-

MINING ENGINEERING

tance from source of supplies and materials, labor insufficient in quantity and poor in quality, and adverse and unhealthful climatic conditions.

That function of the mining engineer which relates to examining and reporting on mining properties is both delicate and difficult, and calls for the highest degree of professional efficiency. In brief, the examination of a mine includes a study of the local conditions, topographical, geological and economic, and of the mineral deposit itself; the mineralogical character, quality, quantity and grade of the ore and its value per ton; an estimate of the cost per ton of mining the ore and the net profit which reasonably may be expected, and lastly, the probable life of the mine. Upon these factors depends the market value of the property. In determining the quantity and grade of the ore, the deposit, as revealed by the development work already done, must be carefully and systematically tested. This is done by taking a series of samples in a manner which will enable the engineer to obtain a true average of such ore as can be examined and measured with sufficient accuracy and definiteness to warrant confidence in the results obtained. Evidently much depends upon how and to what extent the mine has been developed. The variety of conditions which may be met is almost infinite. Nature does not work with rule and plumb-line. Besides the ore which can be actually measured and sampled, the engineer may often be warranted in taking into consideration the quantity of ore which in the future will probably be rendered available by further development of the mine. In balancing such probabilities or possibilities, he must be guided mainly by geological and mineralogical analogies deduced from his previously acquired knowledge and experience. Lengthy discussions bearing upon this subject, by well-known engineers, have been published during 1902 and 1903, under the title of 'Ore in Sight,' in the 'Transactions of the Institution of Mining and Metallurgy,' the 'Engineering and Mining Journal' and the 'Mining Reporter.' It may be added that the circumstances under which mine examinations are made are often rendered difficult and embarrassing where the perpetration of fraudulent practices by interested persons may be attempted, for the purpose of misrepresenting or concealing the true condition of the mine; records of cost and of the value and amount of previous production may be falsified, or the samples taken by the engineer tampered with. Constant vigilance is required to guard against such contingencies.

With the development of the mining industry and the wider adoption of mechanical appliances and engineering methods in connection with mining operations, the demand for trained engineers has steadily increased until, at the present time, probably no field of engineering affords better opportunities for a young man. It is true that the course of preparatory study is exacting and the life somewhat arduous, but as yet it is one of the few professions which cannot be said to be over-crowded. Formerly, the so-called "practical" man monopolized most of the positions of responsibility and emolument, but the educated engineer has made his way to a degree that has produced an active demand for his services. Mining companies have found that the greater breadth of view resulting from a sound technical education has

a direct money value. The trained engineer is acquainted with what is being done in his profession in other regions or countries. He keeps himself informed as to the experiments and discoveries made by others; is quick to utilize improved and more economical methods, and knows not only what to do but also what to avoid. His competitor who lacks this knowledge, and who has at his command only what has come within his own personal experience, is in danger of failure, if circumstances bring him face to face with new conditions, and with problems the prompt and efficient solution of which must be based on a familiarity with the principles of engineering practice. It must be remembered that the young graduate of a mining school is not yet an engineer; he has been grounded in the fundamentals of his profession, has absorbed a multitude of facts relating to its practice, and his powers of observation have been cultivated; but before he is fitted to deal successfully with the diverse problems which sooner or later will confront him, he must in most cases patiently continue his education in the field for some years after graduation. His first employment is likely to be that of chemist, assayer, draughtsman, surveyor or assistant to one of the heads of department in the mine or works. How fast he advances will depend on his native energy and ability and the efficiency of his preparatory training. Not all young men are fitted by nature to become successful mining engineers. If the student has no aptitude for such a pursuit, the sooner he finds it out, the better, both for himself and his instructors. Unquestionably, an immense amount of time, money and energy are wasted in the attempt to give a scientific and technical education to young men whose bent—if they possess any decided bent—is in some other direction. The curriculum of the school, therefore, should be so planned as to eliminate inefficient students as early in the course as possible.

In the making of an engineer, circumstances and opportunity are important. A well-known engineer and instructor has said: "A man without school education may make a remarkable engineer; but it may have taken him years to get his training and at the end of the time there may be whole regions of knowledge utterly unknown to him; in other words, he is liable to be a one-sided man without a broad outlook upon other fields than his own. The school cannot teach him everything, but it can give him the keys to the storehouses which he may need to draw from in after life." A graduate of a good mining school has this advantage over his uneducated competitor: that he is better able to avail himself of the opportunities presented to him.

Mining Schools.—The need of technical schools specially equipped for preparing young men for the profession of mining engineering was long ago recognized in Europe, and some of the institutions there established have exerted through their graduates a marked and beneficial influence upon the mining industry of the world. The best known of the European mining academies are those at Freiberg (Saxony), Clausthal, Aix-la-Chapelle and Berlin (Prussia), Leoben and Przibram (Austria), Paris and St. Etienne (France), and London (England). In addition to these, separate schools for mine foremen are maintained at Freiberg, Clausthal,

MINING LAW

Aix-la-Chapelle, St. Etienne, Prazibram and elsewhere. Previous to 1865, mining practice in the United States was based chiefly upon European methods, and the earliest work prosecuted on a large scale in this country—for example, at the Comstock mines, Nevada—was in great measure planned and managed by American engineers who had received their education in Europe. The influence of the Continental institutions also made itself felt in the organization of the older American mining schools. The first School of Mines in the United States was founded in 1863 under the auspices of Columbia College, New York. Since then, mining schools have been established in many parts of the country, the total number being now about 30. The majority of them, however, are small, with limited equipments and teaching forces. Many exist simply as departments of technical schools connected with State universities. A few are separate and distinct institutions. The leading mining schools of the United States are: the School of Mines of Columbia University, the Mining Department of the Massachusetts Institute of Technology, the College of Mining of the University of California, the State School of Mines of Colorado, the Michigan College of Mines, the School of Mines of the University of Minnesota and the schools at Lehigh University and Lafayette College. The courses of study leading to the degree of mining engineer occupy four years, but exhibit quite wide variations in plan and scope. Some of the best of the schools have rigidly prescribed courses; others offer a range of elective subjects, comprised in more or less interdependent groups. Without attempting a comparison of the curricula of these schools, a condensed statement of the ground covered by one of the leading institutions may here be given:

First Year.—Algebra—general theory of equations (elementary algebra required for admission), analytical geometry, spherical trigonometry (plane trigonometry required for admission), general inorganic chemistry, qualitative analysis, physics, descriptive and determinative mineralogy, including crystallography and blow-piping, theory of surveying and mechanical draughting. In the vacation following the first year, five weeks' field practice in surveying.

Second Year.—Calculus, elementary and analytical mechanics, physics, industrial chemistry, theory of railroad surveying, general geology, elements of electrical engineering, quantitative analysis, descriptive geometry and drawing. In the vacation following, five weeks' field work in general surveying and four weeks' railroad surveying.

Third Year.—Analytical mechanics, economic geology, properties and resistance of structural materials, masonry and timber construction, engineering of power plants, earth and rock excavation, railroad and mine tunnels, boring and shaft-sinking, exploration, development and methods of working mines, general metallurgy, and metallurgy of the non-ferrous metals, graphic statics, assaying, principles of electrical engineering, experimental mechanical engineering, optical mineralogy and petrography. Vacation work: five weeks' systematic study in mines selected for the purpose, one week's study in metallurgical works and one week of field geology.

Fourth Year.—Thermodynamics, steam engines and boilers, heat and its applications, motors other than steam, hydraulics, ore-dressing, mine engineering, mine plant and equipment, mine surveying, mine administration, metallurgy of silver, gold, iron and steel, draughting and design of mine plant, geological examinations and surveys, thesis or project in mining. Laboratory work is required in connection with geology, mineralogy, physics, qualitative and quantitative analysis, assaying, testing of materials, electrical engineering, metallurgy and ore-dressing.

Admission.—The requirements for admission to the best American mining schools comprise: Elementary and certain portions of advanced mathematics, elementary chemistry and physics, free-hand drawing, English, elementary history, elementary German and either elementary French, Latin or Spanish. Under certain circumstances, students may be admitted on certificate of other institutions.

ROBERT PIERCE,
School of Mines, Columbia University, New York

Mining Law. Historical.—This subject may be divided into two classes: (1) As applied to mines found in ordinary real estate, under private ownership; (2) As applied to mines found in the public domain of the United States. The first class needs no especial reference, as it is a part of the general law of real estate and personal property. The second class is *sui generis*, and arose out of the customs of miners and their rules and regulations, which obtained and were established at an early date in California. Soon after the discovery of gold in California in 1848, thousands of persons proceeded to this new El Dorado, impressed with the belief that there was gold sufficient to satisfy the desires of all, which was to be had for the mere mining of it. California had lately become the property of the United States by concession from Mexico, through the treaty of Guadalupe Hidalgo (q.v.). No distinctive government existed, but the territory thus acquired was under the military authority of the United States. Those who came within its borders in pursuit of gold soon found that the common law with all its elasticity could

MINING LAW

not be made applicable to the various conditions which presented themselves, because the like was never known. There was no legislative body in existence to enact laws applicable to these new conditions, and no organized courts to enforce rights and grant effective remedies. These conditions presenting themselves, there grew up at an early period certain peculiar usages and customs applicable to this new industry. Miners organized mining districts and promulgated written rules and regulations based upon these customs and usages for their guidance in the acquirement of mining rights and for the protection of their lives, liberty, and property. A method was thus provided, whereby rights to mine were initiated, and protected, and all rights of liberty and property recognized. These customs, rules, and regulations were recognized by the courts, and adopted by the legislature of California, after the organization of a local political government and afterward by the United States in the enactment of the mining statutes. For 18 years after the treaty above mentioned had been executed, Congress remained inert and enacted no law recognizing the rights of miners to work the mines or in any wise providing for their disposal. The first recognition of the rights of miners by Congress was in the passage of the Act of 27 Feb. 1865, wherein were recognized their possessory rights. On 4 July 1866, Congress reserved all lands valuable for minerals from sale, except as otherwise expressly directed by law; and on 26 July 1866, Congress enacted the first law providing for the location and patenting of quartz claims. This was followed by the Act of 9 July 1870, providing for the location and patenting of placer claims, and on 5 May 1872, the Acts of 1866 and 1870 were amended and revised, and this latter act with subsequent amendments is now the Mineral Act in force.

Classes of Mines.—Mines upon the public domain are of two kinds, viz.: (1) Quartz mines; (2) Placer mines. A quartz mine is one which embraces ground in which exists a vein, lead, lode or ledge in place, carrying gold, silver, copper, cinnabar, tin or lead, or other valuable deposits in its rock or earth. A placer mine, in the broadest sense, and as it now is understood, embraces ground in which exist valuable deposits of mineral or mineral substance not in place.

Definitions.—A mining claim is a parcel of land containing precious metals in its soil or rock. A vein is a body of mineral or mineral bearing rock or earth within defined boundaries in the general mass of the earth. A vein is in place when it is held or enclosed in the general mass of the fixed and immovable rock. The end-lines of a quartz claim are those which cross the vein upon which the location is based, on its course or strike. Side-lines are those which run parallel with the course of such vein.

Location.—Rights to mines upon the public domain are initiated by location, the several steps of which, as provided by the acts of Congress, are: First, the discovery of one or more of the minerals or deposits mentioned in the acts of Congress upon the unappropriated public domain, and within the limits of the claim sought to be located. Second, distinctly marking the claim on the ground so that its boundaries may be readily traced. Third, if the State or territorial statute, or local rules and regulations re-

quire it, the making a record of the claim which must contain the name, or names, of the locators, the date of the location, and such a description of the claim located, by reference to some natural object or permanent monument, as will identify the claim. In most of the mining States and Territories, statutes have been enacted requiring the performance of these various steps in a more definite and special manner, and providing for the performance of other acts all within certain times, and such statutes have been held valid and constitutional by the supreme court of the United States.

By Whom.—Under the acts of Congress no one is entitled to locate a mining claim unless he is a citizen of the United States, or has declared his intention to become such, but practically an alien may locate a mining claim and hold and transfer the same against all the world, except the government, and even as against it, unless it institute proceedings against him on account of such alienage. But an alien cannot patent a mining claim.

Extent of Location.—Only unappropriated public mineral land is open to location, and some surface ground must be appropriated with all locations. A placer claim of 20 acres or less may be located by one person, and an association of eight or more persons may locate 160 acres, and it may be in any form or shape. A quartz claim or mine may be located 1500 feet along a vein, lead, lode or ledge, and 300 feet on each side thereof. It also may be of any form or shape, depending upon the extent of unappropriated mineral land which is sought to be appropriated, but cannot exceed 1500 feet in length and 600 feet in width.

What Located as Placer.—The land department of the United States has held that the following substances, other than those of a metallic character (but classified as mineral), when occurring in the form of deposits not in place, may be located as placer claims: Alum, asphalt, borax, diamonds, precious stones, gypsum, kaolin, marble, mica, soda carbonate and nitrate, slate for roofing purposes, and amber. The acts of Congress have provided for the location of building stone and petroleum as placer claims.

Representation.—In order that the right of possession, acquired by the valid location of mining claims, be continued, there must be placed upon each claim \$100 worth of labor or improvements each year after the year in which the location is made, until patent is issued therefor. Discovery and appropriation are the source of title, and working and development the condition of continued ownership of a mining claim. One need never obtain a patent to a mining claim if he perform his annual representation work, and he may hold it against the world. Patents, if desirable, may be obtained by following the provisions of the acts of Congress.

Abandonment and Forfeiture.—Rights and titles to mining claims may be lost either by abandonment or by forfeiture. Abandonment consists of leaving the claim without intention of returning thereto, and not caring what becomes of it. Forfeiture consists of the failure to perform the annual representation upon the claim, and its location by some third person.

Extraterritorial Rights.—The most remarkable departure from the common law of real estate

MINING ENGINEERS—MINISTER

and mines, is that with reference to extralateral rights. This is only applicable to quartz claims or mines. The acts of Congress give to the locator of a quartz mining claim all veins to their uttermost depths, which have their tops or apices within the surface boundaries of the claim, although in their descent into the earth they so far depart from the perpendicular as to extend outside the vertical side-lines of such surface location. These rights are bounded and limited by vertical planes drawn downward through the end-lines of the surface location, and so continued in their own direction that they intersect such exterior parts of the vein. This right applies to all veins which have their tops or apices within the surface boundaries of the location extended downward vertically. The vein upon which the location is based is designated as the original or discovery vein, and the other veins having their tops or apices within the surface boundaries of the location, are designated as collateral, secondary or incidental veins. In order that extralateral rights attach to the incidental, secondary or collateral veins, the location must be so made on the ground as to give the owner thereof extralateral rights to the original or discovery vein. Whether extralateral rights attach or not, depends on the surface form of the location, as, for instance, the end-lines must be substantially parallel to give any extralateral rights. But speaking generally, the owner of a quartz mining claim has the right to follow all veins in their descent into the earth to their uttermost depth, to the extent that the tops or apices of such veins are within the surface boundaries of his location. If, however, through mistake, inadvertence or want of knowledge, the location is made so that the vein, upon which the location is based, on its course or strike, passes through both side-lines of the location instead of the end-lines thereof, such side-lines as located become the end-lines of the claim for the purpose of bounding extralateral rights. Extralateral rights are confined to the vein itself, and no right is given to go outside the vein. The strike or course of a vein is its length, running with the surface of the earth. The dip of a vein is its departure from the perpendicular on its descent into the earth.

Uniting Veins.—Veins which unite on their dip are owned severally by the owners of the location within the surface boundaries of which their respective tops or apices are found, down to the point of intersection, whereupon the point of intersection and the entire vein beyond that point, belongs to the older claim, which has the apex or top of one such vein within its surface boundaries.

Tunnel Claims.—The Acts of Congress also provide that where a tunnel is run for the development of a vein or lode or for the discovery of mines, the owner of such tunnel shall have the right of possession of all veins or lodes within 3000 feet from the face of such tunnel on the line thereof, not previously known to exist, discovered in such tunnel, to the same extent as if discovered from the surface; and locations on the line of such tunnel, of veins or lodes not appearing on the surface, made by other parties after the commencement of the tunnel, and while the same is being prosecuted with reasonable diligence, shall be invalid. No patent to a vein discovered in the course of a tunnel can be pro-

cured under the statute. No surface location of such vein need be made; but the location notice may be placed at the mouth of the tunnel. The discoverer of a vein in the course of a tunnel is entitled to 1500 feet of the vein, or any part thereof, on either side of the line of his tunnel. A tunnel site located upon the public domain may be 3,000 feet in length, and if the ground on each side of the line of the tunnel is vacant and unappropriated, the owner of the tunnel site is entitled to all blind veins not theretofore appropriated which are encountered in the course of his tunnel to the extent of 1500 feet, any part of which may be claimed on either side of the line of such tunnel.

Coal Land.—While coal is designated by the acts of Congress as a mineral, the lands containing it are not acquired under the Mineral Act, but under a special statute, and are entered and patented by governmental subdivision. See MINES AND MINING.

Bibliography.—For an exposition of the early mining laws of California, consult Yale on 'Water and Mining Rights.' For a full treatment of mining law as to mines on the public domain, consult Lindley on 'Mines,' Adams and Barringer on 'Mines,' Snyder on 'Mines,' and Clark's 'Mineral Digest.'

JOHN BERTRAND CLAYBERG,

Lecturer on Mining Law, Law Department University of Michigan; Author of article on 'Mines and Mining' in 'Cyclopaedia of Law and Procedure.'

Mining Engineers, American Institute of, an organization founded in 1871 to promote the arts and sciences connected with the economical production of the useful minerals and metals, and the welfare of those employed in these industries, by means of meetings for social intercourse and the reading and discussion of professional papers, and to circulate, by means of publications among its members and associates, the information thus obtained. Membership 3,500.

Min'ister, a high officer of state entrusted with the administration of national affairs. Collectively, the persons who constitute the administration are called in Europe the ministry, and also the cabinet. The cabinet of the President of the United States consists of the secretaries of state, treasury, war, navy, the interior, commerce and labor and of the attorney-general and postmaster-general. These ministers hold office at the pleasure of the President, by whom they are appointed subject to the consent of the senate. While in office they cannot hold seats in Congress. The term minister is seldom applied in the United States to members of the cabinet, but is used, as in Europe, to designate diplomatic officers. (See DIPLOMACY.) In Great Britain, of late years, the ministry has been formed by some eminent party leader who has the confidence of the House of Commons, and is authorized by the sovereign to organize a

cabinet. The person thus charged with the task selects from his party or from those favorable to his policy the members of the ministry, taking himself generally the post of premier or prime minister, and commonly the office of first lord of the treasury. The other principal ministers are the lord chancellor, the three secretaries of state for home, colonial, and foreign affairs, the secretary at war, and the chancellor of the exchequer. The executive government of France is divided into departments or "ministries," namely, of state, justice, foreign affairs, interior, finances, war, marine, public instruction and worship, agriculture, commerce, and public works, and Algeria and the colonies. See CABINET.

Minister's Wooing. The, a novel by Harriet Beecher Stowe, first published in serial form in the 'Atlantic Monthly' in 1859. The scene is laid in New England, and deals with the habits and traditions of the close of the 18th century. The "minister" in the tale is the famous Samuel Hopkins 1721-1803, the founder of 'Hopkinsianism.' The central purpose in this story is to show the sternness and inflexibility of the New England conscience, which clings to the Calvinistic doctrines through all phases of life. The struggle that goes on in the heart of the heroine and her mother when the brother and son, James, is supposed to be drowned unconverted, is a graphic delineation of the moral point of view at that time.

Min'tum. See LEAD.

Min'ter, the Siberian squirrel, which has fine white fur; also the fur itself.

Mink, a circumpolar species of weasel (family *Mustelidae*), valuable as a fur-bearer, known in North America as *Putorius vison*, and in the Old World as *P. lutreola*, although substantially the same animal. The mink is a true weasel, with 34 teeth, and not a marten with 36; but it is of larger size, being about two feet long, one fourth of which belongs to the tail, and has a stouter form and bushier tail, more like the martens. Males are much larger than females. The mink differs greatly from both weasels and martens, and in those points in which it is modified toward this mode of life, namely, the half-webbing of the toes, short ears, and close-set, bristly, glistening pelage, it makes an approach toward the others. In color, the mink ranges from dull yellowish-brown to a rich blackish chocolate-brown. The ordinary color is a dark reddish-brown, growing blackish on the tail, and marked by a white patch on the chin of variable extent. The pelage consists of a dense, soft, matted, under-fur, mixed with long, stiff, lustrous hairs on all parts of the body and tail. The gloss is greatest on the upper parts; on the tail the bristly hairs predominate. Northern specimens have the finest and most glistening pelage; but the rough treatment given its coat by the animal in scrambling through holes and crevices in rocks, rotten logs and broken ice, so rapidly damages its fur that only the pelts taken in early winter show the fur to perfection and yield full value to the trapper. Both sexes are extremely odorous, due to the secretion, equally in both sexes, of a fetid musky scent in small perineal sacs opening near the orifice of the rectum, on each side; the smell is powerful, penetrating and lasting, and is under voluntary control of the animal,

but it cannot be discharged like that of the skunk, and is by no means so overpowering. The purpose of this secretion is undoubtedly the attraction of the sexes; and it is used to advantage by trappers as a scent-bait for their traps.

Minks occur in all parts of North America, and are so prolific, so well-supplied with food and so secretive, that they survive numerously even in the more thickly settled parts of the country. They abound near the coast and in the neighborhood of the larger lakes, rivers, and marshes, but are to be found along almost every stream, even in the driest portions of the interior. The minks cling to the water-courses where they find plentiful food in the form of meadow-mice, frogs, muskels, fishes (especially eels) and insects. In New England, at least, they feed largely on earthworms, getting them in plenty even in midwinter; and when very hungry, or a good opportunity offers, do not hesitate to attack larger animals, as muskrats — which they are able to pursue through under-water ways into their houses, — rabbits, partridges, ducks, and poultry. They search the stream-banks for prey, diving and swimming long distances with ease, go about under loose ice and snow, climb rough-barked trees, and penetrate crevices and hollows almost with the ease of a serpent, so that nothing is safe from their inquisitive ferocity; and in winter they wander widely.

Their own homes are made in burrows, usually, but not always, opening in the bank of a stream; and are more often accidental than carefully contrived. In some such retreat the female brings forth in early spring her litter of four or five young, which she guards with great care and courage from all enemies, including the males of her own species. The kittens, and the older ones, indeed, exhibit the same playfulness in and out of the water which characterizes otters.

No fur-bearing animal is so unsuspicious of traps and so easily caught as the minks, and they are the victims of boys and amateurs as well as of professional trappers in all parts of the country. The value of the pelts varies with their color, condition, size and the varying demand of changing fashion, but good ones are always of sufficient worth to make them reward the trouble of taking. When captured young they are easily habituated to confinement in suitable pens, and are tamable to a certain degree. They will breed in captivity, and several temporarily successful attempts have been made to rear them in large numbers for the sake of their pelts. They are fed upon fish, coarse meat, etc. The sexes are kept separate except during the month of March, and reproduction begins when the female is one year old. Tame minks make excellent ratters, doing the duty of ferrets.

Minneapolis, min-ne-ə-p'ō-lis, the largest city in Minnesota (q.v.), is located at Saint Anthony Falls (q.v.) on the Mississippi, 2,200 miles from its mouth. The name is derived from the Indian word *minne*, meaning water, and the Greek word *polis*, city. Minneapolis is situated on both sides of the Mississippi River, and covers an area of 53 square miles. The two parts of

COURT HOUSE AND CITY HALL, MINNEAPOLIS.

MINNEAPOLIS

the city are connected by 17 bridges, nine of which are highway bridges, and eight railroad bridges. To the great water-power at Saint Anthony Falls are to be attributed in large degree the founding of the city and its remarkable subsequent growth and development.

Commerce and Industries.—The rapid increase in population is due to its unrivaled facilities for manufacturing and distributing, and to its location at the gateway of the rich agricultural region of the Northwest, whose population is largely supplied by its manufacturing and commercial interests. The increasing growth and importance of this territory adds yearly to the resources of Minneapolis, and has already made it the chief manufacturing and commercial city of the Northwest. Minneapolis is the largest primary wheat market in the world, and its flour milling (q.v.) industry exceeds that of any other city. Its mills have a capacity of 80,000 barrels daily, and the product is sent to all parts of the world. There were exported to foreign countries in a single year 3,400,000 barrels, while over 16,200,000 were sold in this country. The elevator interests are also great. These, together with the flour mills, furnish employment to many thousands of men. The manufacture of breakfast foods has already become a large industry and is constantly gaining in importance. It was in the manufacture of lumber that the water-power at Saint Anthony Falls was first utilized, and from that beginning Minneapolis has become the largest lumber (q.v.) centre in the United States. The capacity of its lumber mills is about 3,500,000 feet a day, and it is estimated that not less than 10,000 men are employed in all departments of the work. Not only is a large part of this lumber manufactured in Minneapolis, but such are the distributing advantages of the city that much material manufactured in other parts of the West is shipped here for sale and distribution to other points. The proximity of the city to a great and rich agricultural district has made it a favorable point for the distribution of agricultural implements, and in its jobbing trade, in this department, it holds the second place in the world. It is also the centre of an increasing manufacturing industry in agricultural implements, and as the large area of unoccupied land in the Northwest is settled, it is evident that this industry alone will reach vast proportions. The yearly value of the manufactured product in this line already exceeds \$6,000,000. The woolen mills of Minneapolis are well known. Their output is considerable and the quality of their product is excellent. The manufacture of boots and shoes is also an important and growing industry, and the manufacture of clothing for the wholesale trade is increasing at a rapid rate. Minneapolis is also a furniture manufacturing centre. Office and school desks made here are sold in all parts of this country and also shipped abroad. The manufacture of iron and steel has increased very largely in the last few years, and this bids fair to become one of the leading industries of the city. On account of the number of flour mills the making of boxes and barrels is an industry of great importance. The nearness of the city to the flax fields has made the manufacture of linseed oil an extensive industry. The manufacture of paper is carried on here, and the brewing interests are also heavy. Indeed, it would be difficult to name any kind of manufac-

turing which is not carried on in Minneapolis, and the rapid growth of the country tributary to it gives promise of a rapid development of all manufacturing industries in the immediate future.

Parks.—The natural advantages of Minneapolis have been of great value in the development of its park system, upon which much money has already been expended, and the system, when fully completed, will be one of the most beautiful in the country. The park area is about 1,800 acres, and its estimated value over \$5,000,000. The driveways, which come under the control of the Park Board, aggregate nearly 30 miles in length. Connected with the system and lying within the city limits are four beautiful lakes, the largest of which, Calhoun, over a mile long, is less than three miles from the business centre of the city, with which it is connected by a fine boulevard as well as by an electric railway. Harriet, the second in size, is a short distance farther away, and during the summer months is the favorite resort of thousands of people. The remaining lakes are Cedar Lake and Lake of the Isles. Minnehaha Falls, made famous by the poet Longfellow, is also within the city limits and under the control of the Park Board, and is always a point of great interest to visitors from other cities, as well as a favorite resort for the children of Minneapolis. Steps are now being taken to further improve the banks of the Mississippi and when the plans are carried into effect the drive along the river will be most beautiful.

Schools and Colleges.—Minneapolis is recognized as the educational centre of the Northwest. It has an efficient system of public schools with 60 school buildings, 1,000 teachers, and about 40,000 pupils. Great interest is taken in the school system by the people, and they contribute generously to its support. There are four high schools which annually enroll about 4,000 pupils. Minneapolis is also the seat of the University of Minnesota, which has become one of the largest institutions in the country, the enrolment during the year of 1910 being 5,369. Excellent courses of study are presented in all departments and it takes high rank among the universities of the West.

Public Buildings.—Minneapolis is noted for its public buildings, among which will be found some of the finest in the West. The courthouse and city-hall covers an entire block. It is built of granite, is five stories high, and has a tower 400 feet in height; and cost about \$3,500,000. Among the other fine buildings are the Public Library, Guaranty Loan Building, New York Life Building, Andrus Building, Chamber of Commerce, Masonic Temple, Syndicate Block, Glass Block, Lumber Exchange, and West Hotel.

Railroads and Water Routes.—The transportation facilities of Minneapolis are excellent. Ten different lines of railway are represented with their branches and subdivisions, and all have large terminal facilities in the city. Seven railways connect Minneapolis directly with Chicago. The completion of the improvements in the Mississippi River between Saint Paul and Minneapolis will make Minneapolis the head of navigation and give direct water connection with the Gulf of Mexico. The United States government will expend several hundred thousand dollars in these improvements.

MINNEAPOLIS—MINNESOTA

Street Railways.—Minneapolis has a fine system of electric railways, reaching into all sections of the city, and affording direct connection with all the parks and other places of interest. It is owned by the Twin City Rapid Transit Company, which also controls the system in Saint Paul, with which city Minneapolis is already connected by two interurban roads, and a third is being built. The entire system covers 250 miles. Electricity, which is the motive power, is generated by the water power at the Falls. The company also has a manufacturing plant in the city where it manufactures its own cars and carries on its extensive work of repairs.

Churches.—Minneapolis has a large number of churches, all denominations being represented. Among the finest church buildings are Wesley Church (Methodist), Westminster Church (Presbyterian), and Church of the Redeemer (Universalist). Of the Protestant denominations the Lutherans have the largest membership. Among the other large denominations are the Congregationalists, the Presbyterians, the Methodists, the Baptists, and the Episcopalians. The Roman Catholics have many churches. Pop. (1870), 13,066; (1880), 46,887; (1890), 164,738; (1900), 202,718; (1910) 301,408.

CHAS. M. JORDAN,

Superintendent Minneapolis Public Schools.

Minneapolis, Kan., city, county-seat of Ottawa County; on the Solomon River, and on the Atchison, T. & S. Fe and the Union P. R.R.'s; about 130 miles west of Topeka. It is in an agricultural and stock raising region. Its chief industrial establishments are flour-mills, grain elevators, foundry, carriage shops, and creamery. Stone quarries in the vicinity contribute to the industries of the city. The principal buildings are the churches and the school. The public library has about 3,000 volumes. Pop. 2,000.

Minnehaha, mīn-ē-hā'hā, Falls of (Sioux, *Mini-haha*, "laughing water"), a cascade in the Minnehaha River, now in Minnehaha Park, which belongs to Minneapolis, Minn. The cascade has a fall of about 60 feet, and is in a picturesque glen which extends to the Mississippi River. Just below the falls the river is spanned by a rustic bridge. The name has become world-known through Longfellow's "Hiawatha."

Minnequa, mīn-ē-kwā', or **Minnequo Springs, Pa.,** a summer watering resort in Canton Township, Bradford County, picturesquely situated in a glen, surrounded by wooded hills, on the Northern Central railroad, 36 miles south of Elmira. It is frequented for its medicinal mineral springs containing carbonates of soda, magnesia, lime, etc.

Minnesinger, mīn-ē-sīng-ēr, or **Minnesinger** (from Old German *minne*, love), the name given to the German lyric poets of the 12th and 13th centuries on account of love being the chief subject of their poems. The cradle of German lyric poetry was Upper Austria. The earliest German poetry was chiefly narrative, and this not only when past events formed the poet's theme, but also when he celebrated present occurrences. But this contact with the present naturally gave occasion to the expression of the poet's feelings, and gradually led to the lyric pure and simple. Such was the origin of

the oldest extant poems of Dietmar von Eist (1143-70) and others. But the development of German lyric poetry was greatly hastened by the influence of the French poetry of the same class, which at that time flourished in Champagne and Flanders. The immediate effects of this French influence were greater strictness and variety in the versification, a greater preponderance of the subject of love, and a more purely lyrical treatment. The Westphalian Heinrich von Veldeken, afterward regarded by the minnesingers as the true father of their art; Friedrich von Hausen, a native of the Palatinate; the Thuringian Hugo von Salza; the Saxon Heinrich von Morungen; the semi-mythical Heinrich von Ofterdingen; and the two Swabians Heinrich von Rucke and Ulrich von Gutenberg, were the chief minnesingers of the latter half of the 12th century. The 13th century witnessed the highest cultivation of the minnesong, and also the beginning of its decay. Its greatest masters are Walther von der Vogelweide, Wolfram von Eschenbach, Gottfried von Strassburg, and Hartmann von Aue. After the art had ceased to be practised by the minnesingers, it was taken up by the artisans of the towns under the name of meistersingers (q.v.).

Minnesota, mīn-ē-sō'ta, one of the States of the Union, almost in the exact centre of the northern boundary, situated between lat. 43° 30' and 49° N. and lon. 89° 20' and 97° 5' W. It is bounded on the north by the Northwest Territories of British America, on the east by Lake Superior and the State of Wisconsin, on the south by Iowa, and on the west by North and South Dakota. It has alternately been termed the "North Star" and the "Gopher" State, the former appearing upon the official seal, but at the Pan-American Exposition at Buffalo in 1901 the name "Bread and Butter State" was suggested by the exhibits of breadstuffs and dairy products made by Minnesota. It takes its name from two Sioux words meaning "sky-colored water." The floral emblem of the State is the moccasin flower, or lady's slipper. The Territory of Minnesota was organized in 1849 and the State admitted into the Union, 11 May 1858.

Extent and Population.—Minnesota has an extreme length, from north to south, of 380 miles, and its breadth varies from 263 to 338 miles. It has an area of 83,365 square miles, or 53,353,600 acres, including over 10,000 lakes, occupying an estimated surface of 4,300 square miles. The thirteenth census of the United States in 1910 showed the population of Minnesota to have been 2,075,708. Comparison with the previous decennial periods is as follows:

CENSUS YEARS.	Pop.	Increase.	
		No.	Per Cent.
1910.....	2,075,708	324,314	18.5
1900.....	1,751,394	440,568	24.5
1890.....	1,301,826	521,053	66.7
1880.....	780,771	341,067	77.6
1870.....	439,706	267,683	155.6
1860.....	172,023	165,946	2730.7
1850.....	6,077

History.—The area of Minnesota, when it first became known to white men, was occupied

MINNESOTA

by the Dakota (or Sioux) and the Ojibway (or Chippewa) Indians. Advancing from the region of Lake Superior, the Ojibways, in their almost continual wars with the Sioux, wrested from them the region of Mille Lacs about the year 1750, and were thenceforward in possession of nearly all the wooded northeastern two fifths of Minnesota, while the Sioux held its great prairie country on the south and west. But the outbreak of the Sioux in 1862 caused them to lose their homes here, being driven into the Dakota Territory. About 8,000 Ojibways live now on reservations in the northern part of the State. Previous to the settlement and occupation of this area by the white immigration, which may be said to have begun when the Territory of Minnesota was organized, in 1849, there were nearly two centuries of gradually increasing knowledge of the geography of this State. During the first century its explorers were the French, chiefly led to this distant region for the profits of the fur trade. After the British conquest of Canada, the explorers were English-speaking fur traders and travelers; and in the later expeditions were sent by the United States government to acquire information of the unsettled parts of the Northwest Territory and the northern part of the Louisiana Purchase.

The history of Minnesota is thus divisible into three parts: (1) The period of French exploration, 1655 to 1763, the date of the cession of Canada to the English; (2) The period of English colonial and United States exploration, 1763 to 1849; (3) The period of development as a Territory and State, 1849 to the present time. After the discovery of the lower Mississippi in 1541 by the ill-fated De Soto, 114 years passed before this river was next seen by Europeans. Then, in the year 1655, two hardy French explorers, Groscheilliers and Radisson, appear, according to the narrative of the latter, to have crossed Wisconsin to the Mississippi, and to have voyaged up the river to the large island in Minnesota, now called Prairie Island, west of the main channel of the Mississippi above Lake Pepin, between the present sites of the cities of Red Wing and Hastings. This was during the first two expeditions, in each of which these earliest pioneers of exploration in Minnesota advanced far beyond all who had preceded them. In 1679-80, DuLuth and Hennepin were in Minnesota, at Mille Lacs and on the Mississippi; Le Sueur explored the Mississippi and Minnesota rivers in 1683-1700; and in 1731-49 Verendrye and his sons established trading posts along the northern boundary of Minnesota. Soon after Canada was ceded to the English, a colonial captain, Jonathan Carver, traveled in 1766 from Boston to Minnesota, and wintered among the Sioux Indians near the site of New Ulm. In 1798, David Thompson traversed and mapped the region of Red Lake and of the Turtle Lake and river, the latter being tributary to the Mississippi near its source. In 1804, William Morrison was at Itasca Lake, the head of the Mississippi, and in 1832 this lake was visited and named by Schoolcraft.

The first United States government expedition sent into this area was led by Lieut. Zebulon M. Pike, in 1805, only two years after the Louisiana Purchase, which included the western two thirds of Minnesota, on the west side of

the Mississippi River. Pike wintered on the Mississippi at Pike Rapids, near Little Falls, and visited the fur trading posts on Sandy, Leech and Cass lakes. He obtained from the Sioux, by a treaty, a tract adjoining the mouth of the Minnesota River and reaching to the site of Minneapolis, for military uses; and on this tract, on the bluff at the junction of the Minnesota with the Mississippi, Fort Snelling, at first called Fort Saint Anthony, was built in 1819-22. The first steamboat, the *Virginia*, came up the Mississippi to Fort Snelling, 10 May 1823. A second exploring expedition, under the command of Gen. Lewis Cass, came from Detroit in 1820, passing through Lakes Huron and Superior to Sandy Lake and thence up the Mississippi to Cass Lake, which was so named at this time by Schoolcraft, the historian of the expedition. Three years later, Major Stephen H. Long, with a military escort and several scientists, traversed the country west and north from Fort Snelling to the Red River and Lake Winnipeg, and returned east along the canoe route of the northern boundary to Lake Superior. Beltrami, an Italian political exile, was in Long's company to the vicinity of Pembina, and thence traveled alone, or with Indian companies, past Red and Turtle lakes, and down the Mississippi to Fort Snelling. Among the later explorers were Schoolcraft, Featherstonhaugh, Catlin, and Nicollet, the last making a most admirable map in 1842, of the upper Mississippi country before it had any agricultural settlement.

Minnesota was organized as a Territory by Governor Alexander Ramsey, 1 June 1849, then extending west to the Missouri River. It was admitted to the Union as a State, 11 May 1858, with its present area. The first governor of the State was Henry H. Sibley, and the second State governor through the early part of the Civil War was Alexander Ramsey, later United States senator (1863-75). In 1851, by treaties with the Sioux, Governor Ramsey and Luke Lea, commissioners for the United States, acquired the fertile prairie region of southern and southwestern Minnesota for white settlement. On 18 Aug. 1862, an outbreak of the Sioux began in which 800 of the settlers were massacred; 23 September, the hostile savages were overwhelmingly defeated by General Sibley in the battle of Wood Lake; their white prisoners, about 150 women and children, were released; many of the captured Sioux were soon afterward tried, and in December 38 were executed at Mankato. In the ensuing frontier campaigns of 1863 and 1864, the Sioux, who had fled into the Dakota Territory, were severely chastised. Governor Ramsey, in April 1861, was the earliest among the governors of the States to tender troops to President Lincoln at the beginning of the Civil War. During this war 12 regiments were raised by this State and, with later recruits for these regiments and enlistments of Minnesota men in other States, about 25,000 of her citizens served in the War.

Topography.—The chief topographic features of Minnesota are as follows: the valley of the Mississippi River, from Lake Pepin southward, several miles wide, and enclosed by bluffs 200 to 600 feet high; the basin of the Minnesota River, a slightly undulating expanse, 900 to 1,100 feet above the sea; the broad and flat

MINNESOTA

Red River Valley, 800 to 950 feet above the sea; the Coteau des Prairies, in southwestern Minnesota, which rises 1,800 to 1,950 feet above the sea; the Leaf Hills, 100 to 300 feet high, being 1,000 to 1,750 feet above the sea; the Giants Range and the Mesabi Range, north of Lake Superior, each 1,800 to 2,200 feet above the sea, being the highest land in the State; and the Sawteeth Mountains near the northwest shore of Lake Superior, 1,500 to 1,800 feet above the sea, or 900 to 1,200 feet above the lake. To the elevations already stated the following may be added: Lake Superior, 602 feet; Rainy Lake, 1,117; the Lake of the Woods, 1,060; the Red River at the northwest corner of the State, low stage 748; Lake Itasca, 1,462; the Mississippi River at Minneapolis, above the Falls of Saint Anthony, 800; in Lake Pepin, 664; at the southeast corner of the State, low stage, 616; Red Lake, 1,172; Mille Lacs, 1,251; Lake Traverse, 970; Big Stone Lake, 962; and the southwest corner of the State, about 1,400 feet. Prof. N. H. Winchell estimates the average elevation of the entire State to be approximately 1,275 feet above the sea. The river systems of Minnesota include that of the Mississippi, draining about 48,700 square miles of this State, or more than half of its whole area, which is 84,286 square miles; the Missouri River, whose basin includes about 1,700 square miles in this State; the Red River of the North, draining about 15,100 square miles in Minnesota, and the Rainy River, about 10,300, making 25,400 square miles tributary to Hudson Bay; and the basin of Lake Superior and the St. Louis River, tributary to the St. Lawrence, about 8,500 square miles. It is estimated that this State contains 1,000 lakes and the part of its area occupied by water is approximately 5,600 square miles. But there are few or no lakes in the southeast and southwest corners of the State, beyond the outermost moraines of the glacial drift, nor on the flat land of the Red River Valley. Forest originally covered the northeastern two thirds of Minnesota; while the other third, at the south and southwest, and reaching in the Red River Valley to the international boundary, was prairie.

Climate.—The mean annual rainfall, as known by long series of records, is about 34 inches in the southeast corner of Minnesota, 28 to 32 inches about Lake Superior and Rainy Lake; thence diminishing westward to 22 inches at Moorhead and Fargo, and nearly the same at Lakes Traverse and Big Stone, on the west boundary of the State. It is about 28 inches at Saint Paul and Minneapolis. The mean temperature for the year is 46° F. in the southeast corner of the State; 44° at Saint Paul and Minneapolis; and 36 to 34° in northern Minnesota. For January, the coldest month, the mean is 14° in the southeast corner; about 12° at Saint Paul, Minneapolis, and Duluth; and thence it diminishes northwestward to zero at the Lake of the Woods and 2° below zero at Saint Vincent, in the northwest corner of Minnesota. For July, the warmest month, it is 76° in the southeast and southwest corners; 74° at Saint Paul and Minneapolis; about 72° at Moorhead and Fargo; 68° at Saint Vincent; and 64 to 62° in northeastern Minnesota north of Lake Superior. The elevation of this State above the sea, its fine

drainage, and the general dryness of the air, give it a climate of unusual healthfulness.

Geology.—The rock formations of Minnesota, mapped in the geological survey of the State, by Prof. N. H. Winchell, the State geologist (1872-1901), with Warren Upham, U. S. Grant, and others, as assistants, are as follows: glacial and modified drift, spread over all the State excepting its southeastern corner; Fort Pierre, Niobrara, and Fort Benton shales and sandstones, of the Cretaceous series, thinly occupying many tracts throughout the western two thirds of the State, and thickly developed as the chief mass of the Coteau des Prairies, beneath the drift; Devonian limestones and shales, of the Hamilton and Marcellus epochs in Fillmore and Mower counties, and extending into Iowa; Silurian limestone and shales, belonging to the Hudson River and Trenton epochs, reaching from Minneapolis and Saint Paul south and southeast to Fillmore county and northeastern Iowa; Cambrian sandstones and limestones, including the St. Peter sandstone, Shakopee limestone, Jordan sandstone, regarded as the equivalents of the Chazy and Calcareous formations in the northeastern States and Canada, extending in southeastern Minnesota from the Kettle River and Taylor's Falls southwest to the lower portions of the Minnesota and Blue Earth rivers, and occupying a considerable belt along the St. Croix and Mississippi rivers to the southeast corner of the State; the Keweenaw or Cupriferous series, of Lower Cambrian and Algonkian age, consisting of red sandstone conglomerate, and trappean rocks, on the border of Lake Superior, and in Pine, Chisago, and Kanabec counties, but in southwestern Minnesota being mainly red quartzite, exposed near New Ulm, and thence in a few areas westward to Pipestone and Rock counties, in the southwest corner of the State; and the Archean system, of gneisses and granites, schists and slates, together covering more than half of the State, reaching on the international boundary from the Lake of the Woods east to Lake Superior, and extending thence southwest to the Minnesota River between Big Stone and New Ulm, but terminating about 30 miles southwest of this river.

During the Glacial period or Ice age, the latest completed geologic period before the present, this State was enveloped by the northern ice-sheet, excepting a tract on its southeast border, which was a part of the Driftless area. When the ice-sheet was melted away, its drift was left as a general covering of the bed-rocks, the average thickness of the drift upon the western two thirds of the State being about 100 feet, but toward the east, as also north of Lake Superior. A series of the twelve marginal moraines has been mapped, crossing Minnesota, being belted of hilly, knolly, and ridged drifts, with a much larger proportion of boulders than on the smoother areas. These moraines mark the successive outlines of the front of the departing ice-sheet, at times of pauses or slackening of its general retreat and marginal melting.

In the Red River Valley, sloping northward in the direction of the glacial recession, a great ice-dammed lake, named by Upham the Glacial Lake Agassiz, was held by the waning ice-sheet, which was its northern barrier. This ancient lake attained a length of about 700 miles.

MINNESOTA.

CAPITOL AT ST. PAUL.

extending far into Manitoba and the Saskatchewan basin, with a maximum width of about 200 miles and an area of 110,000 square miles, or more, thus exceeding the combined areas of the five Great Lakes tributary to the St. Lawrence. The outlet of Lake Agassiz eroded Brown's Valley, between Traverse and Big Stone lakes, and flowed thence along the course of the Minnesota River into the Mississippi. Many ridges of sand and gravel, and extensive sand deltas, along the sides of the Red River Valley, show the successive boundaries of this old glacial lake, which sank from higher to lower levels as its channel of outlet was deepened, and when later it flowed by other outlets north-eastward. Finally, by the continued recession of the ice-sheet, Lake Agassiz was reduced to its present representative, Lake Winnipeg, uncovering the fertile valley of the Red River, now the most productive wheat district of our continent.

Farming and Agricultural Products.—Minnesota is the thirteenth State in the Union in area. There were in 1910 155,759 farms aggregating 27,623,000 acres, of which about 20,000,000 is improved land. Thousands of acres of swamp land worth \$2 an acre have been reclaimed by the ditchwork system perfected by the State Drainage Commission and are worth to-day \$10 an acre. This work is in its infancy as yet, and consequently thousands of acres remain to be reclaimed to agricultural purposes. The total value of farm lands and buildings in the State is \$1,250,510,000, and the farm implements and machinery represent about \$52,243,000. The total value of the leading crops for the crop year 1909 was \$181,768,084. Wheat is the most important single crop in Minnesota. In wheat raising Minnesota ranks first among all the States of the Union. Over half of the State's acreage is in wheat. The wheat crop ranges from 90,000,000 to 100,000,000 bushels a year. Minnesota produces one seventh of all the wheat raised in the United States. Minnesota also raises one fifth of all the barley raised in the country and ranks second among barley-producing States, with an average crop of 30,000,000 bushels annually. In the value of all cereals raised Minnesota ranks fourth among the States, with a total crop of 260,000,000 bushels and a crop value of \$90,000,000. Minnesota produces 75,000,000 to 90,000,000 bushels of oats and 15,000,000 bushels of potatoes annually, ranking fourth in oat production and ninth in potato production. As an adjunct of the purely agricultural products of the State the creamery interest is one of the great industries of the State. Minnesota ranks fifth in the value of her dairy products. There are in the State 700 creameries which are supplied by 54,000 farmers who milk 420,000 cows. These creameries buy 1,500,000,000 pounds of milk every year and make 76,000,000 pounds of butter yearly, which is sold for \$18,000,000, of which amount \$13,000,000 is paid to the patrons. The creamery industry is a small part of the total dairy industry of the State. Half a million cows do not contribute to the creameries. The total dairy product of Minnesota is \$35,000,000 yearly.

Manufacturing—The manufactures of Minnesota are well known. Most important of these is flour and grist milling. In this industry there

are over 500 establishments with 4,000 employees, and with products valued at \$24,000,000. In 1821 a saw-mill, the first manufactory in Minnesota, was built on the west side of the falls of Saint Anthony. In 1823 it was fitted for the grinding of flour. A second mill was built in 1843, but for some time the development of the flour and grist milling industry was very slow. About 1870 the "low grinding" process, by which the wheat was reduced to flour in one operation, began to give place to the new "milling," in which a number of distinct operations were employed. The falls of Saint Anthony offered superior power facilities, and the millers in that section found a market for their products at profits not elsewhere realized. Minnesota has about 10 per cent of the total capital invested in the United States in flouring and grist mill products, and in this respect was first among the States.

Second among the industries of the State is the manufacture of lumber and timber products, with 438 establishments, 15,140 employees, and products valued at \$43,585,161. The forest resources of the State are very extensive. There are about 52,200 square miles of woodland (stump-lands included), extending over the northern two thirds of the State. Minnesota has done much to promote forest preservation and development. The characteristic products are white and Norway pine, spruce also being abundant. The quantity of merchantable forest pine was estimated in 1900 to be greater in Minnesota than in any other State. Minnesota was then third among lumber-producing States of the Union. The numerous small lakes and streams, many connected with the Cloquet and Saint Louis rivers or Lake Superior, have been of great advantage. In 1900 the quantity of lumber sawed in the State, exclusive of lath, shingles, etc., was 623,000,000 feet.

Mines and Mining.—The larger part of the iron ore of the United States is furnished by the Lake Superior region, originally restricted to Michigan only, but now including Michigan, Wisconsin, and Minnesota. Minnesota was far ahead in 1909 with 28,975,149 long tons. In 1909 the output of ore for the Lake Superior region was 41,042,969 long tons, representing 81.77 per cent of the total quantity reported for the United States. This region includes five ranges,—the Marquette, Menominee, Gogebic, Mesabi, and Vermilion. The Marquette range is in Michigan; the Menominee and Gogebic are partly in Michigan, partly in Wisconsin; and the Mesabi and Vermilion are in Minnesota. The first three mentioned were opened in 1854, 1877, and 1884, respectively. The Mesabi dates from 1892, the Vermilion from 1884. In 1904 the report of the United States Geological Survey for the calendar year of 1902 on the 'Mineral Resources of the United States' stated that to the close of 1902 the Vermilion range had shipped a total of 19,061,526 long tons, the Mesabi 53,747,807 long tons. In 1909 the output of the Vermilion was 1,097,444 long tons, that of the Mesabi 10,152,691 long tons. This latter output was more than half of the total for the Lake Superior region, as given above, and was about 40 per cent of that for the United States. The Vermilion in 1902 was fifth among ranges, and the 15,137,650 long tons constituting the output of the Vermilion and Mesabi ranges were valued at \$23.

MINNESOTA

989,227, an average of \$1.58 per ton. This represented an increase of 4,028,113 long tons over the output for 1901, or 36 per cent. It is a larger amount than was mined in the entire United States prior to 1890. The mines at present developed in Minnesota are all in the Vermilion and Mesabi ranges. The chief points of shipment are the ports of Two Harbors and Duluth in Minnesota, and Superior in Wisconsin. According to an estimate compiled early in 1904, the output for 1903 showed a decline both for the Lake Superior region and for the Vermilion and Mesabi ranges.

Education.—There are in the State 8,800 public school-houses valued at \$18,000,000. There are 415,000 pupils, and 13,000 teachers, who draw in salaries \$4,750,000 annually, an average salary of \$44.00 a month. There are 155 State high schools which draw special aid of \$2,000 yearly and 121 graded schools which draw \$800 a year in special aid. There are five normal schools (Winona, Mankato, St. Cloud, Moorhead, and Duluth) with a total enrolment of 2,600. The State University ranks third in point of enrolment among the universities of the country. The State Agricultural College ranks first among all the schools of this kind in America, and foreign governments send representatives to the Minnesota Agricultural School for special training. The total permanent school fund in 1903 was \$15,600,000. The State auditor says that in 1910 it will be \$35,000,000. The permanent university fund is \$1,500,000.

Penal and Charitable Institutions.—There are five insane hospitals, a school for the blind, a school for the deaf, a school for the feeble-minded, a State public school for dependent children, a State training school, a State reformatory and a State prison. These institutions are under the supervision of a State board of control. These institutions cover 5,400 acres of land, and the total value of their property is \$5,600,000. The annual gross expenditures for these institutions is \$1,200,000. The total number of inmates is 6,700, of which 4,000 are in the insane asylums; 90 in the school for the blind; 275 in the school for the deaf; 900 in the school for the feeble-minded; 260 in the school for dependent children; 400 in the State training school, 200 in the State reformatory and 400 in the State prison. The various State institutions produce annually \$125,000 worth of farm and garden produce for their own use and for sale. The feature of the State prison is the twine plant, which manufactures 9,000,000 pounds of twine yearly. The twine is sold to the farmers of Minnesota at cost, or about two cents under the market value of twine.

Railroads.—Thirty-three railway companies, inclusive of six terminal corporations, have trackage in Minnesota, the total mileage being 7,166. The total cost of construction to 30 June 1902 was \$283,444,660. For the fiscal year of 1902 the gross earnings within the State were \$51,868,191, and the operating expenses \$28,007,439. Upon the basis of gross earnings, the railroads paid into the State treasury, in taxation, in 1902, \$1,659,071. For the tax year of 1903 the gross earnings were \$66,193,731.99 and the taxation \$1,922,204.22.

Finances.—The total assessed valuation of Minnesota is \$780,000,000; the present rate of

taxation is .23, the total bonded indebtedness of the State a little less than one million dollars. The payments from the State treasury last year amounted to \$7,500,000. In 1903 there were 288 State banks under the supervision of the State bank examiner. These banks have a capital stock of \$7,800,000 and deposits of \$22,000,000. There are 12 savings banks with a capital of \$200,000 and deposits of \$18,424,664. There are 8 trust companies with a capital of \$2,000,000 and deposits of \$2,395,073. There are 184 national banks in the State with a total capital stock of \$16,763,825.

Saint Paul is the capital. Under a territorial agreement by which that city became the seat of government, Minneapolis secured the university and Stillwater the State prison. The State recently completed a handsome capitol which, with its parks and approaches, cost approximately \$5,000,000. The reapportionment made in 1901 gave Minnesota nine congressional districts and eleven votes in the electoral college. For legislative purposes, the State is divided into 63 senatorial districts, electing an equal number of senators, for four year terms, and 119 members of the house of representatives for two year terms.

Political.—Minnesota is recognized as an impregnable Republican State. But twice since its organization has it chosen a Democratic governor, upon which occasion local issues controlled the result. The State gave 83,000 Republican majority in the last presidential election and in 1902 returned eight out of nine Republican members of Congress.

Bibliography.—Bryant, 'History of the Great Massacre by the Sioux Indians in Minnesota' (1863); Heard, 'History of the Sioux Wars' (1863); Flandrau, 'The History of Minnesota' (1900); Neill, 'The History of Minnesota' (1882); and the publications of exploration and travel by Radisson, Hennepin, Perrot, Charlevoix, Carver, Pike, Schoolcraft, Keating and Long, Beltrami, Featherstonhaugh, Nicollet, and many later writers.

H. T. BLACK,
Editor 'Saint Paul Dispatch.'

Minnesota, a river which has its rise in the northeastern part of South Dakota, flows through Big Stone Lake on the boundary between Minnesota and South Dakota, then flows southeast in Minnesota a distance of about 350 miles, to where it receives the waters of the Blue Earth, when it turns and flows northeast to the Mississippi River. It enters the Mississippi just south of Minneapolis and opposite Saint Paul. The head waters of the Minnesota and of the Red River of the North are but a short distance apart. The Minnesota is navigable to a rapids about 40 miles from its mouth, and for small vessels nearly 300 miles above the rapids. Its whole length is about 475 miles.

Minnesota, The University of, a State institution at the head of the system of public education in Minnesota, located in Minneapolis, on the east bank of the Mississippi River. Its grounds comprise about 50 acres, and are so situated as to command a good view of the Falls of Saint Anthony and of the Mississippi River. The University Farm belonging to the State School of Agriculture contains 250 acres and is

MINNEWAUWON—MINOR

three miles distant from the University. The charter of the University was granted by the territorial legislature 13 Feb. 1851, when the Territory contained less than 10,000 inhabitants. The State constitution, adopted 13 Oct. 1857, confirmed to the University all rights previously granted to it by the legislature. The institution was organized as a college in 1869, and opened 15 Sept. 1869, with a faculty of nine professors. William W. Folwell, LL.D., a graduate of Harvard College, was its first president and filled the office till 1884. Cyrus Northrop, LL.D., a graduate of Yale University and for 21 years a professor in Yale, was elected president in 1884.

The University consists of the following departments: (1) the College of Science, Literature and Arts; (2) the College of Engineering and Mechanic Arts; (3) the College of Agriculture; (4) the College of Law; (5) the College of Medicine and Surgery; (6) the College of Homeopathic Medicine and Surgery; (7) the College of Dentistry; (8) the College of Pharmacy; (9) the School of Mines; (10) the School of Chemistry; (11) the School of Agriculture; (12) the Graduate Department. The management of the University is vested in a board of 12 regents, of whom the governor of the State, the president of the University, and the State superintendent of public instruction are ex-officio members, and nine others are appointed by the governor and confirmed by the senate. The financial affairs of the University, except the salaries of instructors, are regulated by an act of the legislature passed in 1901, subject to the approval of the State Board of Control. The real estate, land and buildings of the University are valued at about \$2,000,000, and its invested fund is about \$1,400,000. The total attendance of students in 1910 was 5,369, of whom 1,179 were women. The number of professors and instructors in 1910 was 385. There are 18 buildings on the University campus, and 13 buildings on the farm with which the School of Agriculture and the experiment station are connected.

The University is supported by the State. Its fees required of students are nominal, except in the professional schools. One of the finest buildings on the campus is the gift of the late Ex-Governor John S. Pillsbury, who was for many years president of the board of regents, and to whose never-failing devotion the institution is largely indebted for its prosperity. The library contains 110,000 volumes. The requirements for admission are a full four years' course in a high school or its equivalent. Candidates for admission to the College of Medicine and Surgery are required to have completed, in addition to a high school course, two years' work in the University or some other college the educational facilities of which are approved by the board of regents. A special six-years course has been provided by which both the degrees of B.A. and M.D. may be obtained—the first two years being in the College of Science, Literature and Arts, and the last four years being the regular course in medicine.

CYRUS NORTHROP,
President University of Minnesota.

Minnewauwon, min-nē-wā'hōn, N. Dak., village, county-seat of Benson County; on Minnewauwon Lake; on the Great Northern railroad; about 115 miles northeast of Bismarck.

It has lumber-mills and a grain elevator. It has considerable trade in wheat and lumber. Pop. 500.

Minnewaukon, min-nē-wā'kōn, or Devil's Lake, in North Dakota, one of a group of salt lakes which have no apparent outlet. It is about 50 miles long and averages 15 miles in width, area, 750 square miles. The color of the water is darker than that of the fresh waters south. The water is too brackish to be used by men, but the wild animals of the surrounding region seem to like it. Several villages and trading posts are on its shores.

Minnow, a small fresh-water fish; originally a small European fish of the carp family (*Leuciscus phoxinus*). In the United States most of the minnows are of the same family (see CYPRINIDÆ), and are widely known as "shiners" on account of the silvery character of the scales. The spring or breeding dress of the male is often very peculiar, the top of the head and often the fins and portions of the body are covered with small tubercles, outgrowths from the epidermis; the fins and lower parts of the body are often charged with bright pigment, the prevailing color of which is red, although in some genera it is satin-white, yellowish, or even black—Jordan. These little fishes live in clear brooks for the most part and go about in companies, which furnish food for larger fishes. Many of them afford good sport to young anglers; and all are sweet pan-fish, but very bony. They are of decided value, however, as live-bait. Most of the Eastern examples belong to the genus *Notropis*. (See TOP-MINNOW.) Consult Jordan, 'Vertebrates of the Northern United States' (1890).

Minor, mē'nōr, Jakob, Austrian scholar: b. Vienna 15 April 1855. He was educated at Vienna and Berlin, and became professor of German language and literature at Prague (1884) and of Teutonic philology at Vienna. Besides numerous editions of texts, he published 'Neuhochdeutsche Metrik' (1893), an excellent study in prosody, and a valuable incomplete work on Schiller (2 vols. 1890).

Minor, mī'nōt, Robert Crannell, American painter: b. New York 1840; d. 1904. He studied at Barbizon and became a pupil of Diaz. He subsequently went to Antwerp and was taught by Van Luppen and Boulanger, making a specialty of landscape. His student travels led him through Germany and Italy, and on returning to New York he was elected to the National Academy of Design and the Society of American Artists. He exhibited in the salons of Antwerp and Paris, in the Royal Academy of London, as well as in New York, Boston and Chicago. Among his best known works are: 'Dawn'; 'Sundown'; 'The Stream'; 'October Days'; 'Morning in June'; 'Sunrise on Lake Champlain'; 'Cradle of the Hudson'; and 'A Mountain Path'.

Minor, Virginia Louisa, American reformer: b. Groochland County, Va., 27 March 1824. She was educated at Charlottesville Academy (Va.), and in 1843 was married to a relative, Francis Minor, with whom she removed to St. Louis, Mo., in 1846. She was engaged in nursing the soldiers during the Civil War, and since the war has been connected with woman's suffrage movements. She was the originator of the movement in Missouri in 1866.

organized an association in 1867, and was president of the convention which met in St. Louis in 1869. In 1872 she brought the question of woman's suffrage as a right before the Supreme Court of the United States, where decision was rendered against her.

Minor, in law, a person under age of legal capacity, either for any or all acts. Sometimes, as in Scotland, the word is distinguished from the term infant by being more intensive, including those under age but above 14. Usually minor is synonymous with infant (q.v.).

Minorca, mī-nōr'kə (Sp. *Menorca*, mī-nōr'ka), an island in the Mediterranean, belonging to Spain, the second largest of the Balearic group; greatest length, northwest to southeast, 35 miles; average breadth, about 10 miles; area, 260 square miles. It is situated northeast of Majorca, from which it is separated by a strait of 27 miles broad. The coast is much indented on all sides except the south, and generally presents a succession of bold headlands, enclosing small creeks and bays, of which several form good harbors. Of these the best and most frequented is Port Mahon, the capital of the island. The coasts are rugged, and the surface broken and mountainous. Mount El Toro in the centre attains a height of about 5,000 feet. The soil is not generally fertile; still, in good seasons the quantity of wheat and barley grown is sometimes equal to the consumption. The other principal products are oil, wine, hemp, flax, oranges, and lemons. Some good cheese is made, and considerable attention is paid to the rearing of bees. There is an abundance of small game on the island. Iron, copper, lead, marble, porphyry, and alabaster abound in several districts. The inhabitants make excellent sailors, but generally are indolent, ignorant, and bigoted. At an early period Minorca was under the Carthaginians, who drew from it a number of excellent slingers, who distinguished themselves during Hannibal's wars in Italy. It afterward passed successively into the hands of the Romans, the Vandals, and the Moors. The last were expelled in 1285 by the Spaniards. During the greater part of the 18th century it belonged to the British, who finally ceded it to Spain at the Peace of Amiens (1802). Its exchange with Great Britain for Gibraltar has been frequently discussed. Pop. (1900) 38,300.

Minorea, a breed of large black and white domestic fowls. See **POULTRY**.

Minority Representation. See **REPRESENTATION**.

Minos, mī'nōs, in Greek mythology, (1) a ruler of Crete, said to have been the son of Zeus and Europa. He was celebrated as a wise lawgiver and a strict lover of justice. (2) A grandson of the preceding, son of Lycastus, son of the elder Minos and of Ida. This second Minos was the husband of Pasiphaë, whose unnatural passion gave birth to the Minotaur. He was king of Crete, but is not represented as having succeeded to the kingdom, but by one tradition as having acquired it through the favor of the gods, and by another as having conquered it over his brother Sarpedon. He is said to have made war upon the Athenians to revenge the death of his son Androgeos, who was killed at the festival of the Panathenæa by the candidates whom he had defeated at the games. Mi-

nos having defeated the Athenians, exacted from them every year a tribute of seven youths and seven maidens, who were devoured by the Minotaur. Theseus delivered the Athenians from the burden of this tribute.

Minot, mī'nōt, Charles Sedgwick, American scientist: b. West Roxbury, Mass., 23 Dec. 1852. He was graduated from the Massachusetts Institute of Technology in 1872, studied also at Leipsic, Paris, Würzburg, and Harvard, was lecturer on embryology and instructor in oral pathology and surgery in the Harvard Medical School in 1880-3, instructor in histology and embryology in 1883-7, assistant professor in 1887-92, and professor from 1892. He invented two forms of the microtome, an instrument for the automatic preparation of sections, for microscopical study. He was elected president of the American Society of Naturalists in 1894, and president of the biological section of the American Association for the Advancement of Science in 1901. Among his works are: 'Bibliography of Vertebrate Embryology' (1893); and 'A Laboratory Text-Book of Embryology' (1903).

Minotaur, mī'nō-tār, in Grecian mythology the son of Pasiphaë and a bull, having the body of a man with the head of a bull, or the head of a man and the body of a bull. He ate human flesh, on which account Minos confined him in the labyrinth built by Dædalus, and at first exposed to him criminals, but afterward the youths and maidens yearly sent from Athens as a tribute, until at length Theseus killed him, and freed the Athenians from this tribute.

Minot's Ledge, or **Cohasset Rocks**, in Massachusetts, a promontory and lighthouse in Boston Harbor. See **LIGHTHOUSE**.

Minsk, Russia, a city and government of Lithuania, West Russia. Minsk, the city and capital of the government, is on the Svisloch, 420 miles by rail southwest of St. Petersburg. It is the see of a Greek archbishop and of a Roman Catholic bishop. It has some manufactures of woolen cloth, hats, leather, and a considerable general trade.

The government, bounded on the north and east by Vilna, Vitebsk, and Moghilen; on the south and west by Chernigov, Kieff, Volhynia, and Grodno, has an area of 35,293 square miles. Pop. about 2,500,000.

Min'ster (Anglo-Saxon, *Mynster*, from *monasterium*) anciently signified the church of a monastery or convent. In Germany and in Great Britain this title is given to several large cathedrals, as York Minster, the minster of Strasburg, etc. It is also found in the names of several places, which owe their origin or celebrity to a monastery, as Westminster, Leominster, etc.

Min'stel, a name introduced into England by the Normans, and which comprehended singers and performers of instrumental music, together with jugglers, dancers, sleight-of-hand performers, and other similar persons. See **NEGRO MINSTRELS**; **TRUOADOURS**.

Mint, a genus of perennial herbs (*Mentha*) of the order *Labiata*. About 30 species have been described, of which 12 are either native or naturalized in America, characterized by square stems, opposite simple leaves, small, purple, white or pink, two-lipped axillary

MINT

flowers, in whorls which often form terminal spikes. All are noted for the fragrance of their foliage, due to the presence of an essential oil, for the production of which half a dozen species are more or less cultivated. The following are the most important ones: Spearmint (*M. spicata* or *viridis*), peppermint (*M. piperita*), pennyroyal (*M. pulegium*), bergamot-mint (*M. citrata*), and Japanese mint (*M. arvensis*, var. *piperascens*). Spearmint is the species most used as a culinary herb in the form of mint sauce served mainly with roasted lamb. Peppermint is largely employed in flavoring candy and for the production of menthol. Bergamot-mint is chiefly used in perfumery. Medicinal properties have been attributed to all of them, and they have all been cultivated upon a commercial scale to supply the various demands. Besides these cultivated species, which are frequently found as escaped plants near gardens, there are several native species, of which the following are perhaps best known: Round-leaved mint (*M. rotundifolia*), which occurs rather interruptedly in the coast States from Maine to Texas; water mint (*M. aquatica*), with hairy stems, rather rare in wet places in New England and southward to Maryland; whorled mint (*M. sativa*) and its close relative, corn mint (*M. arvensis*), which are found in damp fields in New England; and wild mint (*M. canadensis*), which extends northward from the northern States across the continent. All are recognizable by their resemblance to other members of the genus, especially by their odor. Several other related plants of other genera are called mint, among them being mountain mint (*Pycnanthemum* spp.), also popularly known as basil. The numerous species are widely distributed throughout the United States and Canada, and have a mint-like flavor and odor. Catnip (*Nepeta cataria*) is often called cat mint, and several species of *Monarda*, especially *M. punctata*, are known as horse-mint.

The half-dozen cultivated mints are managed alike. They will grow on any soils that will produce good crops of potatoes, but since they are considered exhausting crops, are included in the rotation only once in five or more years. Upon reclaimed swamps, however, which are considered best adapted to their cultivation, they are generally allowed to remain consecutively for five years or even more without change of crop. The land having been plowed, harrowed and otherwise fitted, small pieces of the root-stocks are dropped at intervals of a few inches in shallow furrows about 30 inches apart. All through the season the land is kept scrupulously free from weeds, especially of smartweed, fireweed, ragweed and horseweed, which seriously injure the product if included in the "hay" from which the oil is distilled. Hand-weeding is commonly practised after horse cultivation is stopped by the luxuriant vines. About midsummer, or when the earliest flowers appear, the tops are cut, either with scythes or sometimes with mowing machines, and cured like hay. They are then stored under cover for distilling. This process is usually conducted with steam, which enters the still below, passes upward through the mass of hay, carrying the essential oil with it, and condenses in coils of pipe chilled by running water. After condensation, the oil and water separate by gravity. After standing for a greater or less length of

time, crystals of menthol (q.v.) appear in the oil of peppermint. The annual yield of oil per acre sometimes exceeds 50 pounds, and sometimes a second profitable cutting of the crop may be made in autumn. Having once been planted the crop takes care of itself from year to year. The most important producing centre is in southwestern Michigan and northwestern Indiana. Perhaps next is Wayne County, New York. Other important mint fields are at Mitcham, Surrey and Lincolnshire, England, and in Saxony, Germany.

Mint, a place where money is coined by public authority. In Great Britain there was formerly a mint in almost every county. Besides the sovereign, barons, bishops, and the principal monasteries exercised the right of coining. From the time of William the Conqueror the great bulk of the coining of Great Britain was done in London, but it was not till the reign of William III. that all the provincial mints were abolished. The present mint on Tower Hill, in London, was erected between the years 1810 and 1815. The London mint supplies the whole of the coinage of the British Empire, except Australia and the East Indies, which are supplied from branch mints at Sydney, Melbourne, Perth, Calcutta, and Bombay. In France the number of mints was at one time considerable, and in the earliest times indefinite. Before the Revolution there were 27 mints, each of which had a letter or letters of the alphabet for its sign. In 1857 there were still seven French mints, namely, Paris, Bordeaux, Lille, Lyons, Marseilles, Rouen, and Strasburg. In 1858 those of Lille, Marseilles, and Rouen were abolished, and in 1860 that of Lyons, so that there were only three mints remaining in 1870, when Strasburg was taken by the Germans.

In the United States there are mints at Philadelphia, established in 1790; at San Francisco, established in 1853; at Carson City, established in 1869 (operations at this mint have been discontinued since May 1893, and probably it will never be opened again, it is now conducted merely as an assay office); at Denver, established in 1866; and at New Orleans, established in 1835. (See COINAGE.) The Bureau of the Mint was established as a division of the Treasury Department in 1873. It has charge of the coinage for the government and makes assays of precious metals for private owners. The rolling machines are four in number. The rollers are adjustable and the space between them is governed by the operator. About 200 ingots are run through per hour on each pair of rollers. When the rolling is completed the strip is about six feet long. As it is impossible to roll perfectly true it is necessary to "draw" these strips, after being softened by annealing. The drawing benches resemble long tables, with a bench on either side, at one end of which is an iron box secured to the table. In this are fastened two perpendicular steel cylinders. These are the same distance apart that the thickness of the strip is required to be. It is drawn between the cylinders, which reduces the whole to an equal thickness. These strips are now taken to the cutting machines, each of which will cut 225 planchets per minute. The press now used consists of a vertical steel punch.

MINT GERANIUM — MIRA

From a strip worth \$1,100 about \$800 of planchets will be cut. These are then removed to the adjusting room, where they are adjusted. After inspection they are weighed on very accurate scales. If a planchet is too heavy, but near the weight, it is filed off at the edges; if too heavy for filing, it is thrown aside with the light ones to be re-melted. The planchets, after being adjusted, are taken to the coining and milling rooms, and are passed through the milling machine. The planchets are fed to this machine through an upright tube, and as they descend are caught on the edge of a revolving wheel and carried about a quarter of a revolution, during which the edge is compressed and forced up. By this apparatus 560 half-dimes can be milled in a minute; for large pieces the average is 120. The massive but delicate coining presses coin from 80 to 100 pieces a minute. These presses are attended by women and do their work in a perfect manner. After being stamped the coins are taken to the coiner's room. The light and heavy coins are kept separate in coining, and when delivered to the treasurer they are mixed in such proportions as to give him full weight in every delivery. By law, the deviation from the standard weight, in delivering to him, must not exceed three pennyweights in 1,000 double eagles.

Mint Geranium. See **COSTMARY**.

Min'ton, Thomas, English pottery manufacturer: b. Wyle Cop, Shrewsbury, 1765; d. 1836. He was originally an engraver having learned his art from John Turner, who had paid special attention to the process of printing on delft or chinaware. He settled at Stoke upon Trent in 1791 and founded a pottery factory with the object of producing glazed pottery in the highest style, which should compete with the productions of foreign countries. He was completely successful and the range of his manufacturers was increased by his son Herbert Minton, who succeeded him in 1836, and manufactured the famous "Parian" porcelain and the encaustic tiles, with which the name Minton is now most commonly associated.

Min'uet, a French dance, in slow time, which requires great grace and dignity of carriage. It was the favorite dance in the time of Louis XIV. The name is also given to a piece of music written for such a dance in triple time.

Minuit, mīn'ū-It, **Minuita**, or **Minneuit**, mīn'ē-wit, **Peter**, German colonist in America: b. Wesel, Rhenish Prussia, about 1580; d. Fort Christina, New Sweden (Delaware), 1641. He was an official in America in the service first of the Dutch West India company and then of the Swedish West India company. Appointed governor of New Netherlands by the Dutch West India company on 19 Dec. 1625, he landed on Manhattan Island on 4 May 1626, purchased the island from the Indians for trinkets valued at approximately \$24, built Fort Amsterdam, and governed with a great degree of success until his recall in August 1631. In 1633 the charter of the Swedish West India company, originally granted in 1626, was renewed, and in 1637 Minuit, under the direction of the company, set sail from Gothenburg with 50 Swedish and Finnish colonists to found a colony in North America. He arrived at Dela-

ware Bay in April 1638, purchased from the Indians the territory between the falls of the Delaware at Trenton and Cape Henlopen, called this region New Sweden, and built Fort Christina. This colony was taken by the Dutch in 1655.

Minutáan, mē-noo-loo'ān, Philippines, a pueblo of Negros Occidental on Guimaras Strait, 5 miles north of Bacólod, the provincial capital. Pop. 11,340.

Minute, a division of time and of angular measure; the 60th part of an hour, and the 60th part of a degree. In astronomical works minutes of time are denoted by the initial letter *m*, and minutes of a degree or of angular space, by an acute accent (').

Minute Men, in the American Revolutionary War, the militia, who were prepared for service at a minute's notice. They were principally civilians, resident in Massachusetts, who were enrolled in accordance with an act of the Provincial Congress, passed 23 Nov. 1774. There were in Boston alone 16,000 minute men ready for service.

Minyas, mīn'yās, in Greek mythology, the son of Chryses, the hero of the *Minyas*, from whom were descended most of the Argonauts. His three daughters, Clymene, Iris, and Alcihoë, or Leucohoë, Lencippe, Alcithoë, were changed into bats for having made light of the mysteries of Dionysus.

Miocene Period, in geology, the middle period of the Tertiary era, intermediate between the older Eocene and the newer Pliocene. Considered in respect to its invertebrate (fossil) fauna the earlier part of it ("lower" Miocene) forms a part of the Oligocene (q.v.); but no such distinction can be made when the period is judged by its vertebrate remains. See **TERTIARY ERA**.

Miohip'pus, a fossil horse of later Miocene time. See **HORSE**, **EVOLUTION OF**.

Miquelon, mēk-lōn, an island in the Atlantic Ocean, near the southern coast of Newfoundland, at the entrance of Fortune Bay, with St. Pierre (q.v.) forming a French colony. The southern part of it is called Little Miquelon (*Petite Miquelon*) or **LANGLEY ISLAND**, and was once a separate island, but since 1783 has been connected with it by a sand-bank. The island has been in the possession of the French since 1763. It is under the direction of the commandant of St. Pierre and is occupied only by a few families engaged in the fisheries. The area of Miquelon is 83 square miles; pop. about 600.

Mir, mēr, in Russia, a name given a commune, consisting of the inhabitants of one or more villages, who are as a community owners of the surrounding land.

Mira, mī'ra or mē'ra, or **Stella Mira** (the wonderful star), in astronomy, the star Omicron Ceti, a remarkable variable, situated in the neck of "the whale." Its variability was discovered in 1596 by Fabricius. The period is somewhat irregular, but averages about 331 days. During the greater part of this time the star remains of about the 9th magnitude, but during about 100 days it rises to a maximum which may vary from the 2d to the 5th magnitude, remains for a week or 10 days there, and then sinks to

its minimum again. When shining with a brightness of the 2d magnitude, it is giving out more than 600 times as much light as when at the 9th magnitude.

Mirabeau, Gabriel Honore Riquetti, gā-hrē-ēl 8-nō-rē rē-kēt-tē mē-rā-bō, or **mīr'ā-bō**, COMTE DE, French orator and Revolutionary leader: b. Bignon, near Nemours, 9 March 1749; d. Paris 2 April 1791. In 1767 he entered the Berry cavalry regiment, was promoted 2d lieutenant, but on account of misconduct was later imprisoned on the island of Ré until March 1769. He then joined the expedition to Corsica, in 1771 was commissioned captain of dragoons, and in 1773 was married. In 1774 he was imprisoned in the Castle of If, owing to debts and quarrels with his wife and father, and the next year was transferred to the Castle of Joux, near Pontarlier. Here he fell in love with the young wife of the Marquis de Monnier; trouble ensued and Mirabeau finally escaped to Switzerland, where he was joined by his mistress, Sophie, as he called her, and in October 1776 they settled in Amsterdam. In May 1777, however, they were arrested, brought to Paris, and Mirabeau was imprisoned for three years and a half at Vincennes, being released in December 1780. After Mirabeau had forsaken her, Sophie committed suicide in 1780. Having secured the revocation of the death sentence imposed upon him for the seduction of Sophie, and being legally separated (1783) from his wife, he left France for a few months. Upon his return he began his life-long intimacy with Henrietta van Haren, known as Madame de Nebra, whose influence was undoubtedly exerted to his great benefit. In August 1784 he was forced to flee to London to allow more trouble to blow over, and while there wrote the 'Considérations sur l'ordre de Cincinnatus.' About 1784 he began to devote himself to politics, visited London, was entrusted by Calonne with a secret mission to Prussia, and published various treatises, which made him sufficiently well known to the *tiers état* to be elected by the town of Aix to be its representative in the States-General of 1789. Here he speedily eclipsed all the other orators of the Assembly, and became the centre round which gathered all the men of greatest mark and force of character in the third estate. He was the immediate cause of the French Revolution, by the resistance which he offered to the demand of the king after the royal sitting of 23 June 1789, that the third estate should vote separately from the other two orders. It was on this occasion that he gave the vigorous reply to the grand-master of ceremonies, who had communicated to the Assembly the royal will, concluding with the words, 'Go and tell your master that we are here by the will of the people, and that no one shall drive us out except by the force of bayonets.' Both before and after this occasion he delivered many eloquent speeches, which obtained for him the title of the 'French Demosthenes.' Among the most remarkable of these are his address to the king demanding the removal of the troops encamped at Versailles, speeches on the national bankruptcy, on the civil constitution of the clergy, on the royal sanction, on the right of peace and war, and his reply to the Abbé Maury on ecclesiastical property. After having shown himself a bold reformer, and the most dangerous ad-

versary of the court, Mirabeau ended by offering his support to the throne, although he continued to make a show of opposition to royalty in order to uphold his popularity. This state of matters dates from May 1790. It appears to be true that in this change of position he acted from conviction, foreseeing the imminence of a great catastrophe, which he desired if possible to avert. Whatever may have been his motives, this conduct, when it became known, naturally raised up against him numerous enemies. But on 30 November he was elected president of the Jacobin Club, and on 29 Jan. 1791 of the National Assembly. His remains were buried with great pomp in Sainte-Geneviève Church (the Pantheon), but three years later they were exhumed to make room for those of Marat. Consult: 'Mémoires biographiques, littéraires et politiques de Mirabeau,' by his adopted son, Lucas de Montigny (1834-5); and 'Correspondance entre le Comte de Mirabeau et le Comte de la Marck pendant les années 1789-91' (1851). Other important works on Mirabeau are: Ménilhou, 'Essai sur la Vie et les Ouvrages de Mirabeau' (1827); Reynald, 'Mirabeau et La Constituante' (1872); Louis and Charles de Loménie, 'Les Mirabeau' (1878 and 1880); Aulard, 'Mirabeau' (1882); A. Stern, 'Das Leben Mirabeaus' (1889; Fr. trans. 1895); Mézières, 'Vie de Mirabeau' (1892); Carlyle, 'French Revolution,' and 'Essays on Mirabeau'; Willert, 'Mirabeau' (1898).

Miracle Plays. The earliest dramatic representations of religious themes grew up within the Church itself. At certain seasons of the year, tableaux of gospel scenes were shown to the people, a practice which still survives in the representations of the Nativity in modern Catholic churches. The introduction of action and music into these tableaux is easy to understand, particularly in view of the dramatic elements in the celebration of the Mass, and in the ritual for special occasions, like the consecration of a church. Simple Latin words were next set to the music accompanying a given scene and this text was called a *trope*. In time these tropes grew more elaborate, passages in the vernacular were introduced, and popular elements not taken from the Bible were added. Meanwhile, the little plays, which in the beginning had been given in the choir, were transferred to the nave, and set up against the pillars. So popular did these representations become, and so great was the concourse of spectators, that a move outside the building into the churchyard had to be made. Secular elements crept in very rapidly, and the plays were finally transferred to open spaces in the cities and towns. The liturgical drama reached its height in the 13th century; by the beginning of the 14th century it had largely passed out of the hands of the clergy, although representations continued to be given in many churches.

The growth of the miracle play in England is due to the influence of the Normans. There are almost no evidences of dramatic impulse in England before the Conquest. The earliest play of which there is mention by name is a 'Play of Saint Katherine,' at the beginning of the 12th century, produced under the direction of a Frenchman who afterwards became Abbot of Saint Albans. To the same century belongs the work of Hilarius, a pupil of Abelard, and perhaps

MIRACLE PLAYS—MIRACLES

of English birth. He wrote Latin plays on subjects taken from the Scriptures, and diversified them with refrains in Old French. It seems probable that French plays may have been acted in England at this time, but none are extant.

The term "miracle play" is properly applied to the religious plays which developed in England out of liturgical beginnings. They have sometimes been called "mysteries," but this term, which is more generally and rightly used of productions in France, does not antedate the 18th century in England, the mediæval name being *miraculum*, or *miracle*. A great impetus was given to the plays by the institution of Corpus Christi Day, with its elaborate processions and outdoor ceremonial, and many came to be presented at this season, when the conditions of weather were likely to be favorable. In time the procession served as a mere preliminary to the dramatic performances to follow. A desire for more elaborate stage effects and a greater number of incidents within the plays was constantly increasing, until there developed out of the relatively simple early pieces long groups of plays of cyclic character, covering the principal events of the Scripture narrative, in both the Old and the New Testament. The series given at York in 1415 begins with the Creation, and ends with the glorification of Mary and Jesus in heaven, embracing 48 separate pieces in all. These cycles were often not all given on one day, but extended over two or more days, or they were divided, and presented in succeeding years.

After leaving the churches, the plays soon passed into the hands of the guilds, or associations of tradesmen. In the 13th century clerics were forbidden by Papal edict to appear on the stage, but these prohibitions were frequently disregarded. The control of the plays by the guilds marks a period of great importance in the history of the English drama. Much care was devoted to the production and acting of the various pieces. The corporation of the city had general charge of the matter, deciding when the performances should be given, and dividing the various scenes among the several companies. An effort was made to have the play suit the character of the guild that gave it; the shipwrights showed the building of the Ark, the watermen the Flood, and so forth. The plays were given on movable stages called *pageants*, which consisted of "high scaffoldes with two rowmes," one beneath which was used as a dressing room, and one above, open on all sides to give a better view, and occasionally provided with a canopy. These wagons moved from place to place, repeating the performance at different stations. The number of these stations varied with the size of the town; there were sometimes a dozen or more. The pageant wagons were gaily painted and decorated. They were generally rectangular, but special shapes were required for the Ark, or for Hell-Mouth, a huge painted head with open jaws belching fire and smoke. The scenery was of a rude sort. Palaces, temples, and castles were sometimes represented by boxes or wickerwork covered with cloth. Occasionally the actors made use of the open space in front of the pageant; Herod's "raging" appears to have been partly done in the street. The costumes were often expensive, but frequently grotesque. Herod was attired like a

Saracen, with red gloves. Pilate always wore a green cloak, and wielded a huge club. God the Father was represented in person, and dressed all in white, with a gilt wig. The devils and the Evil One were made very realistic, and came to furnish a great deal of low comedy. Various accounts of sums paid for properties and costumes are still preserved.

Four cycles of miracle plays are still extant, the York, Chester, Coventry, and Towneley or Woodkirk plays. The Towneley series, so called from the family who long owned the manuscript, much resembles the York cycle, and like it displays much vigor and humor. The Chester plays perhaps appeal most to modern taste. The religious passages are more reverent, the humor less coarse, and the versification less harsh. The Coventry plays are full of didacticism, and this, with the introduction of personified abstractions, relates them more closely than the others to the Moralities. Fragments of other cycles have also survived. The Vulgate and the Apocrypha are the chief sources of the text. In places some tragic elevation is reached, marred, however, by repetition and moralizing. Melodramatic and ranting scenes were popular. The comic scenes are often very spirited, and clearly based upon observation of the life of the people. Anachronisms are common, and the supernatural is treated with great naïveté.

The miracle plays were at their best in the time of Chaucer. In the 15th century the Moralities arose to compete with them for favor, but never equalled them in dramatic achievement. The miracle plays continued to be given until the beginning of the 16th century, but in the reign of Elizabeth they had ceased to be a vital force. Their influence in preparing the way for the Elizabethan drama was very great, however. They introduced elementary types of comedy and tragedy, farce and melodrama, and accustomed the people as a whole to dramatic conventions. They made a national drama possible in the time of Shakspeare, and kept the theatre from being a mere amusement for the nobility, or a diversion for a small group of literary people.

WILLIAM W. LAWRENCE,

Instructor in English, Columbia University.

Miracles, works which excite wonder, because they are beyond ordinary human experience and appear to contravene the known laws of nature.

The well-known argument of Hume against the credibility of a miracle has often been refuted. A miracle, he said, was contrary to experience, but false witnesses in history are not contrary to experience; it is less probable that the miracle is true than that the witness is false. There are two fallacies in this reasoning; it begs the question by the use of the words contrary to experience, for the point at issue is whether miracles are contrary to experience or no. If they are contrary to Mr. Hume's experience may it not be because his experience is

MIRAGE

limited? He has not lived at an age when a new religion was instituted, and extraordinary guarantees demanded in order to accredit it with a hostile world. Even mankind's experience in nature is becoming widened every year and many wonderful things take place at this moment which our ancestors of a century ago would have looked upon as magical or miraculous, such as the wireless telegraphy, communication, by telephone, the effects of the Roentgen rays, the power of radium, etc. For miracles are not to be looked upon as a violation of the laws of nature, but merely as the interposition of a higher law overruling a lower one. To those who believe in an intelligent creator and conservator of the world there can be no difficulty in apprehending the possibility of the miraculous; even those who like Herbert Spencer have a vague belief in what they style Force or Power underlying all the operations of nature, should not hesitate in admitting that the force which keeps up the multitudinous activities of the universe may manifest itself at times in unprecedented fashions, even as the new discoveries and combinations of science are constantly revealing new powers in the domain of natural law.

Pascal has said that the certainty and genuineness of certain miracles is proved by the falsity of others, meaning, presumably that the very fact that general human consent has been given to the idea of miracles proves that such idea has a counterpart in reality. There are of course certain concomitant circumstances which may be taken as affecting the credibility of a miracle. Most of the miracles of history may be put aside as inventions, such as many of the stories told by Livy and Herodotus, and the wild fables of Hindu history, as well as many miraculous incidents in the life of Mohammed. Christian apologists lay particular emphasis on the moral aspects of the miracle. To those who deny or doubt the existence of a supreme being, the moral ruler of the universe, a miracle is an impossibility. On the other hand, without miracles the revelation of God is impossible. Hence, a miracle with a moral object is most in accordance with the character of a Supreme Being governing the world with a moral end. All idle or superfluous miracles are to be rejected as at variance with the character of such a being. Equally to be rejected are miracles which are merely tentative, that is, sometimes successfully accomplished, sometimes ending in failure; as well as others which are doubtful in their nature, and those which are merely exaggerations of natural events.

In the early church those who defended Christianity against the attacks of those outside laid great stress on the evidence of miracles, and claimed that miraculous power still existed among Christians. Irenæus asserted that this power was universal among Christian churches. St. Augustine asserts the reality of the miraculous on the testimony of his own experience. He makes the acute remark that a miracle is not contrary to nature but to what we know of nature. The schoolmen did not agree with Augustine on this point. Thomas Aquinas defines a miracle as "something out of the order of nature." Albertus Magnus declares that God has implanted the possibility of miracles in the very nature of things, although denying that he can do anything contrary to nature. Luther

puts the miracle of grace in the heart far above any physical miracle, while he assigned the Bible miracles their proper place in the development of the faith. The Roman Catholic Church has always claimed the possession of miraculous powers and continues to do so to this day. The Socinians and Arminians maintain that God has always revealed himself by means of supernatural works, and Grotius in his defense of Christianity makes miracles the foundation of his argument. There has always, however, been a school of rationalists or philosophers who have opposed or attacked the belief in miracles, although Leibnitz admitted this belief into his philosophical system. He defines a miracle as an event inexplicable by natural causes. The laws of nature, he says, are not necessary and eternal; God can for his own purpose suspend them; the miraculous is included in the divine plan, and forms a part of "the pre-established harmony." Spinoza made the statement that miracles are impossible. In his pantheistic philosophy nature and her laws are identical with the will, intelligence and nature of God who cannot work contrary to the laws of material nature. Kant like the English Deists did not deny the possibility of miracles, for they might be wrought by powers and in accordance with laws of nature with which we are unacquainted, but believed that such laws were never exercised. Schleiermacher contests the apologetic value of miracles, and endeavors to eliminate the miraculous from the Christian scheme, which he thinks is lowered by this supernatural element. The modern agnostic claims that the advance of science has made a belief in the miraculous impossible. Some have tried to explain the recorded miracles of Scripture by a reference to natural causes; others would treat them as allegories or attribute them to self-deception, or fraud, or the credulous exaggeration of the bystanders and witnesses. But miracles form an essential part in Christianity, and cannot be either explained away or eliminated without destroying its authority. Consult: Duke of Argyll, 'Reign of Law' (1866); McCosh, 'The Supernatural in Relation to the Natural' (1862); Trench, 'Miracles of our Lord' (1884); Balfour, 'The Foundations of Belief' (1895); Pfleiderer, 'Philosophy and Development of Religion' (1894).

Mirage, *mi-rāzh'*, the name given to certain illusory appearances due to the bending of rays of light in the atmosphere. The earliest attempt to explain the mirage seems to be that of Monge, who accompanied Bonaparte's Egyptian expedition; he thus describes what was observed by the French soldiers: "The villages seen in the distance appeared to be built upon an island in the midst of a lake. As the observer approached them the boundary of the apparent water retreated, and on nearing the village it disappeared, to recommence for the next village"; he attributed the phenomenon to the hot sand of the desert keeping the lower layers of the atmosphere at a less density than the upper ones; the rays of light from the lower parts of the sky and objects in the distance arrive at the surface separating the less dense layer of air from those above, and are there subjected to total reflection; the eye sees the sky in the direction of the received rays, and this gives rise to the idea of a lake.

It is often assumed that rays of light pass through the atmosphere in straight lines; this is approximately true for short distances, but astronomers and surveyors have to correct their observations for refraction. By the laws of optics it is easy to see why a ray passing obliquely through the atmosphere, when this is arranged in horizontal layers of equal density (those of greater density being lowest), should bend, and that a vertical ray should not bend; but optics does not tell us why a horizontal ray is much more refracted than an oblique one. The explanation (first given by Dr. James Thomson) is easy on the undulatory theory of light. The wave front of a horizontal ray of light is at right angles to the ray, and is a vertical plane; now light is less rapidly propagated in the lower layers of air, hence the lower part of the wave front is retarded, and when the light has proceeded some distance its wave front is no longer vertical, and the ray has bent downward (the ray is always supposed to be normal to the wave front). Thus, in the atmosphere in its normal state the path of a ray of light is always slightly concave downward. Professor Everett thus explains the appearance of "castles, obelisks, and spires," cities with many buildings, forests of naked trees, and great basaltic precipices sometimes assumed by irregularities in cakes and fields of ice. It sometimes happens that several inverted images of an object are seen in the same sky; these may be accounted for by assuming that there are several layers of air, in each of which there is a rapid variation (an increase upward) of the index of refraction. Mirages are not uncommon in California, Nevada and Alaska.

Miramar, *mê-râ-mâr'*, a celebrated palace on the shore of the Adriatic near Grignano, 6 miles from Trieste, the home of the Archduke Maximilian, afterward emperor of Mexico.

Miramichi, *mir'â-mî-shé'*, Canada, a river of New Brunswick formed by the junction of the northwest and southwest Miramichi, about 35 miles above its mouth in Miramichi Bay on the Gulf of Saint Lawrence. The northwest affluent rises in the highlands east of the Nepisiquit, and is about 90 miles long, 16 miles of which are influenced by the tides. The southwest or main headstream flows from a lake near the Tobique, and fed by numerous rivulets draining a lake district, becomes a considerable river 185 miles long to its confluence with the northwest branch. The Miramichi is navigable for large vessels two miles above Newcastle, the principal town on its banks. Salmon, trout and other varieties of fish abound in the river and its tributaries, and on one of the latter, Stewart's Brook, there is a government fish-breeding establishment.

Miramon, *Miguel*, *mê-gèl' mê-râ-môn'*, Mexican soldier: b. City of Mexico 29 Sept. 1832; d. Querétaro 19 June 1867. He was educated in the military school of Chapultepec in 1846; was a volunteer in the war with the United States; became a colonel in the Mexican army; deserted with his regiment to take part in the revolt at Puebla in 1856; and for that was degraded when Puebla was taken by Comonfort. In October 1856 he headed another revolt at Puebla, in 1856-8 was conspicuous in the party of the reactionists, and was chosen by the

electoral junta to succeed Zuloaga as president 2 Jan. 1859 (entered office 2 February). He continued to take part in the "war of reform" in 1859-60, but was defeated at Calpulalpam, near Mexico, 22 Dec. 1860, by Ortega, and fled to the coast, sailed to Europe, and probably was concerned in the plans of Napoleon III. for an invasion of Mexico. Maximilian appointed him grand-marshal and minister to Berlin. Later, he was given a high command in the imperial army, and conducted with Maximilian the defense of Querétaro. He was captured on the surrender of the city, and shot with the emperor.

Miranda, *mê-rân'dâ*, **Francisco Antonio Gabriel**, Venezuelan revolutionist: b. Caracas 9 June 1756; d. Cadiz, Spain, 14 July 1816. In 1773-82 he was an officer in the Spanish army, then served with the French allies in the colonies in the Revolutionary War (1779, 1781), and was a general of division in the French republican army (1790-3). He began a scheme for obtaining the independence of Spanish South America, founded the important society *Gran Reunión Americana*, which included many names later prominent in the South American revolution, and in 1806 made a futile attack on the Venezuelan coast. In 1810, on the breaking out of the revolution in Venezuela, he returned, in 1812 was made dictator, but on 25 July capitulated to the royalists. He was sent to Spain, and there remained a prisoner. Consult: Briggs, 'History of Don F. Miranda's Attempt to Effect a Revolution in South America' (1809); Baralt, 'Historia de Venezuela' (1841).

Mir'iam, the sister of Moses (q.v.) and the eldest of the family, is first mentioned as being stationed by her mother to watch her brother's cradle among the sedges on the river's brink. Later she procured her mother as nurse for the child when found by the princess. After crossing the Red Sea she is mentioned as "Miriam the Prophetess," and she takes the lead with Aaron in the complaint against Moses for his marriage with a Cushite. For this action she was stricken with leprosy, but later the curse was removed, and she died toward the close of the wandering in the desert. She was buried in Cadesch.

Mirror, a smooth surface usually of glass, capable of regularly reflecting rays of light. A mirror may be (1) a polished surface of glass; (2) a surface of tin-foil on the further side of a sheet of glass (as in the common looking-glass); (3) the surface of a deposited film of silver or platinum on a polished glass surface, so that rays of light to and from the metallic reflecting surface do not pass through the glass; (4) a polished surface of silver, gold, platinum, or speculum metal (a bronze composed of about 32 parts of copper to 15 of tin, small quantities of lead, antimony, and arsenic being sometimes added).

Looking-glasses date from the 12th century; they were a great improvement on the more ancient speculum metal mirrors, whose reflecting surfaces were liable to oxidation from exposure to the air, but they have the disadvantage that there are two reflecting surfaces, one of glass, the other of metal. Polished metals reflect nearly all rays of light at all incidences; glass reflects very few rays at the normal incidence,

but the amount of reflection becomes greater and greater as the incidence becomes more and more oblique. Mirrors are usually either "plane" or "spherical." Spherical mirrors are small portions of the surface of a sphere. In a spherical mirror, concave or convex, the line through the centre of the spherical surface of which the mirror is a part and the middle point of the mirror is called "the axis." From a concave mirror rays parallel to the axis converge after reflection to a point called the "principal focus," which is half-way between the centre of the sphere and the mirror. (See LIGHT) Rays from a luminous object outside the spherical centre of a concave mirror form a small, real, inverted image of the object between the centre and the principal focus; when the object is between the centre and the principal focus the image is beyond the centre, and is large, real, and inverted.

Prior to 1835 mirrors were almost universally made by applying a coat of tin-foil amalgamated with mercury to the surface of plate-glass. In 1835 Baron Liebig observed that on heating aldehyde with an ammoniacal solution of nitrate of silver in a glass vessel, a brilliant deposit of metallic silver was formed on the surface of the glass. To this observation the more recent process of silvering glass is really due. In 1849 Drayton made known a method in which he employed as a backing composition two ounces of nitrate of silver, one ounce of ammonia, three ounces of alcohol, and three ounces of water. The defects of these two modern processes are that the deposit of silver on glass is not so adherent and unalterable under the influence of sunlight and sulphurous fumes as the old amalgam of tin and mercury; besides, the newer processes give the glass a slightly yellowish tinge. These disadvantages have been obviated by applying to the silver coating a weak solution of cyanide of mercury, which immediately forms a kind of amalgam, and renders the deposit at once much whiter and more adherent. The silvering is protected from mechanical abrasion and the chemical action of gases and vapors by a coating of shellac or copal varnish, which when dry may receive a further covering of red-lead paint. A method of coating glass with platinum has been recently introduced. A solution of bichloride of platinum is spread over the surface of the glass with a fine brush, and the metal is precipitated with oil of lavender. As this summary process produces a somewhat gray lustre it is used only for cheap mirrors, the lids of ornamental boxes, toys, and the like.

Mirror Carp. See CARP.

Mirror for Magistrates, The. This once popular work, the first part of which was published in 1555, and the last in 1620, was the result of the labors of at least 16 persons, the youngest of whom was not born when the oldest died. It probably owed its inception to George Ferrers, Master of the King's Revels at the close of the reign of Henry VIII; and he associated with himself William Baldwin. Richard Niccola is responsible for the book in its final state; and in the interim, it was contributed to by Thomas Newton, John Higgins, Thomas Blennerhasset, Thomas Chaloner, Thomas Sackville, Master Cavyll, Thomas Phaser, John Skelton, John Dolman, Francis Segar, Francis

Wingley, Thomas Churchyard, and Michael Drayton. It is a "true Chronicle Historie of the untimely fall of such unfortunate princes and men of note, as have happened since the first entrance of Brute into this Island, until this our latter age." It was patterned after Lydgate's 'Fall of Princes,' a version of Boccaccio's poems on the calamities of illustrious men, which had been very popular in England. The stories are told in rhyme, each author taking upon himself the character of the "miserable person" represented, and speaking in the first person. The first one told by Ferrers is that of Robert Tresilian, chief justice of England.

Mirza, mēr'zā, Persian title, equivalent to "Prince."

Mirzapur, mēr-zā-poor', India, a city and district of the Benares division of the United Provinces of Agra. Mirzapur, signifying the Prince's Town, the capital of the district, is on the right bank of the Ganges, 56 miles by rail southeast of Allahabad. It presents an imposing appearance from the river, with fine ghats leading down to it, and numerous mosques, temples, and handsome European houses occupying some of the most conspicuous sites, but the interior is disappointing. It has the largest mart in Upper India for grain, cotton, and other raw produce, but with the railway era and the rise of Calcutta to commercial importance, much of its trade has migrated elsewhere. Shellac, brassware, and carpets are manufactured. There are imports of grain, sugar, cloth, metals, fruit, spices, tobacco, lac, salt, and cotton; and exports of the same articles with manufactured lac-dye, shellac, and ghee butter. The military cantonment is three miles northeast of the town, on a peninsula formed by the windings of the Ganges. Pop. about 83,000. The district has an area of 5,224 square miles, and a population of about 1,200,000, chiefly Hindus. The chief products are wheat, barley, cotton, oil-seeds, and fruits.

Misamis, mē-sā'mis, Philippines, a province of the island of Mindanao, situated on the north central coast, bounded on the east by Surigao; area, 3,406 square miles, with dependent islands, 3,521 square miles. The province is crossed by two mountain ranges, one on the east side with summits of 5,000 feet elevation, and the other on the west side with a peak that rises 5,427 feet. It has a number of rivers, and is crossed by the Grande de Mindanao, or Pulangui, which rises in the northeast; Lake Lanao also extends over the southern boundary within its limits. The staple agricultural products are hemp, chocolate, coffee, cotton, sugar, rice, tobacco, corn, and sweet potatoes; the forests contain woods valuable for building as well as resinous trees. The chief industry is the manufacture of fabrics used for dress for home consumption and sacks for packing purposes. There are no good roads of any importance; the inland towns and villages are reached by river or trail, and the trade between coast towns is by native craft. Civil government was extended to the province in 1901; the population is mostly Visayan, with some Moros in the western part; the provincial governor reported in December, 1901, that the tranquillity of normal times was restored, with rarely some depredation from the Moros of Lake Lanao. Pop. 126,950.

Mischianza, mīsh-ke-ān'sā, The, in American history, an entertainment given in Phila-

MISDEMEANOR — MISSAL

delphia, 18 May 1778, during the War of the Revolution, by officers of the British army, in honor of Sir William Howe. The entertainment was given at the country home of Thomas Wharton and comprised a dinner, dancing, a regatta, mock tournaments and various games. Major André was prominent in planning the entertainment.

Misdemeanor, in law, any offense below felony; the least offense by English common law. In the United States, the different States vary widely in defining misdemeanor, so that what is misdemeanor in one State may be indictable felony in another. Among the offenses commonly classed under this heading are malicious mischief, assault and battery, etc.; criminal proceeding on such charges may be dropped, in many States, if the injured party acknowledge satisfaction, which suggests a distinction between felony. The historic line between the two classes of offenses was based on the outcome of conviction; in the case of felony the convicted person forfeited his property, real and personal, if the felony was capital, personal only if the felony was not capital. But no forfeiture of property ensued upon conviction for misdemeanor.

Miseno, mè-sà'nò, Cape, Italy, a promontory forming the west side of the Bay of Poszuoli (ancient Cumæ), 10 miles southwest of Naples. On it are the ruins of the ancient city of Misenum, destroyed by the Saraceni, 890 A.D., which Augustus made one of the principal naval stations of the Romans.

Miserere, miz-er-è-rè (Latin, "have mercy"), the name by which the 50th psalm in the Vulgate (or Latin version) is known, corresponding to the 51st of the English version. The *Miserere* forms part of certain liturgies, and various great composers have taken it as a subject. The *Miserere* of Allegri is particularly famous.

Misericordia, or **Misericorde**, a narrow-bladed Italian dagger used in giving the *coup de grâce* or finishing stroke to a wounded foe. Also the name of a society in Florence, founded in the 13th century, who tend the poor sick, carry victims of accidents or disease to the hospitals, and the dead to their burial.

Mishna, mish'nà, the first part or text of the Talmud, the second part or *Gemara* (supplement) consisting of a commentary on or elucidation of the Mishna, which consists of oral traditions and glosses on the Pentateuch, made in Galilee by the Rabbi Jehudah or Judah Hakko-desh, who completed the work 220 A.D. A commentary was rendered necessary by the extreme terseness and conciseness of style with which the Mishna is composed. It is written in Hebrew, but it contains a number of Greek, Latin, and Aramaic words, which had become naturalized in the Hebrew, and bears traces also of Aramaic idiom. The traditions set down in the Mishna were held by the Pharisees to be of equal authority with the written law of Moses, and were supposed to constitute an oral law delivered to Moses by God and by Moses delivered to Joshua, by Joshua to the elders, by the elders to the prophets, and by the prophets to the men of the Great Synagogue. Such is the statement of the Mishna itself, which the Pharisees accepted. The Sadducees, however, rejected this

doctrine, although in many cases they followed in practice "the traditions of the elders" with much fidelity. See JUDAISM — *The Talmud*.

Misiones, mè-sè-ò'nés, Argentine Republic, a territory bounded on the north by Brazil, on the east by the rivers San Antonio and Pepiri or Pepiri-Guazu, separating it from Brazil, on the south by Brazil, and on the west by the province of Corrientes and Paraguay. Area, 11,282 square miles. Three low mountain chains radiate from the centre, and the greater portion of the surface is covered with forest, producing building and dye-woods, oranges, medicinal herbs, and the *yerba maté*. Maize is largely grown and sugarcane to some extent, and several sugar-mills are in operation. Posadas, the capital, on the Parana was founded in 1865. The territory has a population of 4,000.

Miskolcs, mish'kòlts, Hungary, capital of the comitat of Borsod, 24 miles northeast of Erlau. The inhabitants are chiefly employed in the cultivation of cereals and the vine, and there is an important trade in wine, corn, leather, stone, etc. Among the churches is a Gothic one of the 13th century, and it has also a fine hospital, several gymnasia and other educational institutions, and a theatre.

Misrepresentation, in law, any act, whether verbal or tacit, tending to create or creating a false impression on another, such that by acting upon this impression he is injured. Misrepresentation falls under two heads, deliberate and unwitting. Deliberate misrepresentation is either deceit (q.v.) or fraud (q.v.). Unwitting misrepresentation is legal mistake (q.v.), and its treatment by the law depends largely on circumstances, but is unfortunately too much influenced by the principle that "ignorance does not excuse," which should strictly be confined to the application suggested by its original form, "ignorance of the law" (q.v.).

Missal (Latin *missale*, from *missa*, mass), the book which contains the prayers, rubrics, antiphons, etc., of the mass. It was formed by comprising in one volume the separate books formerly used in different parts of the service, namely, the Oratorium, Lectionarium, Evangelarium, Antiphonarium, the Canon, etc., for the convenience of the priest. Variations and corruptions in the course of time crept into the text of the Missal, and the Council of Trent suggested a revision of it. This was accordingly accomplished by order of Pius V. (1570), who required the new Missal to be used by the whole church, with the exception of those societies which for more than two centuries had followed another ritual. Subsequent revisions made under Pope Clement VIII. (1604) and Urban VIII. (1634) extended little beyond alterations of single expressions, and the addition of new masses. In the ancient and mediæval church there were many varieties of Missal having only a local use. Thus, in England there were missals of the Sarum use, Hereford use, Lincoln use, Bangor use, etc. There are also missals of the Greek Church, the Church of the Maronites, and other Christian sects. The earliest printed missal is the '*Missale per totius Anni Circulum More Ambrosiano compositum*' (Milan, 1475, folio), which was followed by the '*Missale secundum Consuetudinem Romanæ Curie*' (Rome, 1475).

MISSION INDIANS—MISSIONS

Mission Indians, a general name given the Indians of southern California who in the 18th century were christianized by the Spanish Franciscan missionaries. The Mission Indians were originally of many tribal families and dialects, but chief among them were the Yumas and the Shoshones. Father Junipero Serra (q.v.) and the other friars who followed him succeeded in gathering the Indians into communities, mission houses and chapels were built and vineyards planted. The work began about 1776 and continued successfully until 1831. In this latter year they numbered 19,000, but with the overthrow of the Spanish power by the Mexicans a period of confiscation and destruction began, which continued to 1840. The friars were banished, the mission abandoned and the Indians driven back to the deserts and the mountains. Under the American rule in California, both Indians and missions were neglected until after the Civil War, when the government took steps to care for the unfortunate natives. They now occupy about 30 small reservations, which in the aggregate contain 180,000 acres. The remaining Indians number about 2,600. They are partly civilized and fairly industrious. Within recent years an organization in Los Angeles has been endeavoring to rebuild the ruined missions and preserve them in remembrance of a historic past.

Missionary Ridge. See CHATTANOOGA, BATTLE OF.

Missionary Society, Methodist. See METHODIST EPISCOPAL CHURCH.

Missions, Protestant Foreign. Foreign missions were not seriously undertaken by Protestants until more than 200 years after the Reformation. This curious fact is sufficiently explained by the circumstance that the reformers were involved at the outset in a struggle, not only for liberty but for life itself; that Christendom did not yet control the whole of Europe; an aggressive Mohammedan power with its foot in Hungary and its fleets in the Mediterranean being still active in its purpose of conquest, and that the State alone commanded resources sufficient for enterprises of any kind in remote regions like the Indies, Africa, or America. These circumstances of life in Europe in the 16th century materially lessen the importance of the question whether Luther and his followers did or did not see that a Christian Church must die which is not actively missionary in principle.

The first Protestant missions, perhaps naturally, were state enterprises, unless we reckon as a mission the single effort of Heiling (1634) in Abyssinia, which ended with his murder 20 years later. In 1556 the Council of Geneva sent missionaries to Brazil with Coligny's colony, who perished with the colonists. In 1635 the Duke of Gotha sent a mission to Persia, and in 1663 again a mission to Abyssinia; both unpractical embassies were quickly forgotten. The Dutch Government, after gaining possession of the East-Indian archipelago in 1602, made a serious effort to Christianize the Malays, and the people of Ceylon and of Formosa, producing permanent results in Java and the adjacent islands of the East Indian Archipelago only. The Dutch Government published in 1685 the New Testament in Malay (the second of modern translations of Scripture into heathen languages; Ehot's translation into Mohican in 1663 having been

the first), and the whole Bible in 1701. It has also maintained a Malay Protestant Church in Java, the Moluccas and Celebes, which now has about 400 ministers and 250,000 adherents, of whom probably one half are descendants of the 17th century converts. A similar state missionary enterprise undertaken by a Protestant Government of Europe was the Danish mission to South India, founded by King Frederick IV. of Denmark in 1706. The king sent out as the first missionaries to Tranquebar, Ziegenbalg and Plutschau, Germans from Francke's school at Halle. Other Germans from the same surroundings followed, notably Schultze and his later associate Schwartz, making this Danish mission the first serious Protestant mission in India. Ziegenbalg translated the New Testament into Tamil (the third of modern translations of Scripture into heathen language), and before the end of the century from 30,000 to 50,000 Tamils had become Christians.

Another mission maintained by Frederick IV. of Denmark was that commenced by Hans Egede in Greenland in 1721, and later transferred to the care of the Danish Missionary Society. This mission Christianized the whole Eskimo population in the vicinity of the Danish trading stations.

The British Government showed a similar sense of responsibility for missionary work in its colonies, and the duty of preaching to the North American Indians was laid down in the charters of Virginia (1584) and Massachusetts (1628). Parliament even went so far as to consider in 1648 the endowment of a state foreign missionary enterprise. It voted a grant in aid of the "Society for the Propagation of the Gospel in New England," formed in 1649 and still existing under the name of the New England Company, which educates Indians in Canada with the revenues of the ancient government grant. John Eliot of Roxbury, Thomas Mayhew of Martha's Vineyard, and others through this government solicitude received state support in their missionary work for Indians. The British East India Company, moreover, was required by its charter in 1698 to maintain chaplains at its stations, and to instruct its Hindu servants in Christian doctrine.

All of these state enterprises in the line of foreign Protestant missions were uncertain in method and precarious in stability. They served, at least, to show the possibility of prosecuting missions in the colonies, and were sufficiently barren to suggest the formation of those voluntary societies for missionary effort which proved to be the effective form in which the missionary idea among Protestants was to express itself.

Unsatisfactory religious conditions in the East India Company's trading posts led in 1698 to the organization of the "Society for the Promotion of Christian Knowledge," with the purpose of providing books and schools for neglected English communities, and in 1701 to the appearance of the "Society for the Propagation of the Gospel in Foreign Parts," intended to provide for the religious culture of Englishmen residing in foreign lands. Both of these societies were directed by the Church of England, although voluntary in form and in the sources of their revenues. Neither of them were Foreign Missionary Societies. But the first now publishes books in Oriental languages, and it saved the Danish Mission in South India from

MISSIONS

dying with its royal founder, and supported it during a century, until it was taken over by the Society for the Propagation of the Gospel. This latter Society, too, has gradually taken up the work of evangelizing pagans until now it has about 700 missionaries in India, China, Japan, Malaysia, Africa, and the West Indies, with nearly 3,500 native clergy and laymen in the various departments of its work. These two societies then, founded about the beginning of the 18th century, may be considered as the pioneers of the voluntary foreign missionary societies of Protestant Christendom.

It was not until the 19th century was about to dawn, however, that a general movement toward Missionary enterprises began among Protestants in Europe and America. This movement grew out of that revival of personal religion in the 18th century which was fostered by the writings of Spener and Francke, the Pietists of Halle, and by the devoted lives of men like David Brainerd of Connecticut, and Zinzendorf, the patron and leader of the Moravians, and was stimulated by the exhortations of Whitefield, the Wesleys, and Jonathan Edwards, and by the example of the "Unity of Brethren" (*Unitar Frætrum* or *Brüder Unitar*) as the Moravians call themselves. The Moravians, not as a church that begs men to volunteer, but as a community in which every member has equal interest in the missionary idea, were the first decided champions of Protestant Missions. They held it the duty of all Christians to tell men what benefits they have received from Jesus Christ. They established missions between 1732 and 1770 in the West Indies, in Greenland, in the Indian settlements of North America, among the Hottentots of South Africa, and in Labrador. They now support more than 300 missionaries and 1,800 native preachers and teachers in their various mission fields which include, besides those already named, Alaska, Australia, and the border lands of Tibet. The English Wesleys should also be reckoned with the Moravians as having taken up missions in advance of the general movement of the Protestant churches. They did not formally organize the Wesleyan Methodist Missionary Society until 1814. But in 1779 they employed missionaries among the North American Indians, and in 1786 they began an important work among the slaves of the West Indies. The Society now has 280 missionaries, and 3,634 native workers and teachers in India, Ceylon, South Africa, China, Polynesia and the West Indies.

Before this extension of Wesleyan Missions took place a surprising outburst of zeal for the missionary idea appeared almost simultaneously in England, in the United States and on the continent of Europe. It was a revolution, since formalism had made the Protestant churches almost forget that to be a Christian means to be always in some sense a missionary. The characteristic feature of the movement was its origin in the conscientious convictions of isolated individuals, from whom the Church did not expect initiative and whom it sometimes regarded as unsteady enthusiasts. William Carey, a cobbler and a Baptist minister in England, made the first move in 1786 and was frowned down by his elders. But in 1792 his earnest conviction carried the day; twelve men united to form the Baptist Missionary Society (England), and Carey and Thomas went to India as its first

missionaries. There is no space here to describe the marvelous activities of Carey and his associates Marshman, Ward, and others, at the Danish trading post of Serampur near Calcutta, where they were given asylum when the East India Company refused to tolerate their presence in its territories. The great school buildings which these missionaries erected at Serampur stand to-day, and their press added to the then slender stock of Bible translations, passably good versions of Scripture in 34 Oriental languages and dialects. The Baptist Missionary Society has about 400 missionaries and 2,300 native preachers and teachers in India, Ceylon, China, Africa, and the West Indies.

This example was contagious. In 1795 "The Missionary Society" was formed in London by the union of notable men of four different denominations. Its name was afterward changed to "The London Missionary Society." It is now substantially composed of Independents (Congregationalists) alone, and has about 325 missionaries and 7,000 native preachers and teachers, in Polynesia, New Guinea, Madagascar, Africa, India, and China. In 1796 two similar societies were formed in Scotland which at first aided the London Society, but later took up independent work in the West Indies and in South Africa, and finally (1824) became merged in the Church of Scotland Foreign Missionary Committee, of which a later (1843) offshoot was what has now become the Foreign Missionary Society of the United Free Church of Scotland. The Church of Scotland Foreign Missionary Committee now has about 200 missionaries and 600 native workers, and the United Free Church has 500 missionaries and 3,000 native preachers and teachers in India, China, Africa, Arabia, the New Hebrides, Manchuria, and the West Indies. The same impulse led in 1797 to the formation in Holland of the Netherlands Missionary Society. This was first an auxiliary of the London Missionary Society but soon undertook independent work. In 1809 it had 30 missionaries and 75 native workers in the Dutch East Indies.

The same conviction of responsibility together with realization of the extent and condition of the heathen world led in 1797 to the organization in London of 26 men belonging to the Church of England as the "Society for Missions to Africa and the East." This name later gave place to the familiar one of the "Church Missionary Society." Among its founders were William Wilberforce, Henry Venn and Charles Simeon; but the Church of England gave the Society no encouragement until the successes of nearly 50 years compelled recognition. Hence the first missionaries of this Society were commonly Germans; for the most part men of the highest ability and attainments. The fields of the Church Missionary Society are India, Ceylon, China, Japan, Africa, Mauritius, New Zealand, Persia, Palestine, Egypt, the Sudan and the Arctic regions of British North America. It now has about 1,500 missionaries and 10,000 native preachers and teachers.

Missionary enterprises next began to spring up in Germany and in America. The marked characteristic of the movement in every case was the same profound conviction of individuals, commonly not officials of the churches to which they belonged. Three students of Williams College in Massachusetts furnished the initiative that resulted in the organization of the "Amer-

MISSIONS

ican Board of Commissioners for Foreign Missions in 1810. This was at first an interdenominational Society. Its first missionaries, Newell, Judson, Hall, Rice, and Nott, were sent to India and were ordered out of the country by the East India Company the moment they landed. Judson and Rice took refuge with the English Baptists at Serampur, while the others succeeded in effecting a lodgment at Bombay and in Ceylon. The fields of this Society in 1903 were India, China, Japan, Ceylon, Africa, Turkey, and Micronesia, and it had 544 missionaries and 3,581 native preachers and teachers. After 40 years of existence as an interdenominational Society, it handed over its missions in Persia, Syria, and the Gabon region of West Africa to the Presbyterians, and part of its field in South India to the American Reformed (Dutch) Church, and has become substantially a Congregationalist body. Judson and Rice of the earliest missionaries of this Society decided on arriving in India that they would prefer to serve under a Baptist organization and this decision led to the formation in 1814 of what is now the "American Baptist Missionary Union" of Boston. Burma was the field selected for its first efforts and the heroic work of Adoniram Judson in that land made his name great among modern Protestant missionaries. The "A. B. M. U." had 600 missionaries in 1909 and 4,000 native workers in Burma, Siam, Assam, India, China, Japan, and Africa.

Meantime, in Germany, Jannicke of Berlin, whose brother was a missionary of the "Danish Halle" band in South India, opened a Missionary Training School at Berlin in 1800. This school during the next 25 years furnished about 80 missionaries to the service of the English and Dutch Societies, and served to arouse interest in Missions among the Germans. Its influence led in 1815 to the establishment of a Missionary Training Institute at Basel in German Switzerland. The latter institute furnished many admirable men to the service of other societies and in 1822 began to send out missionaries of its own. The fields of the Basel Missionary Society are in India, China, and Africa, and graduates of its Institute are pastors of Protestant churches in Turkey. It now has in the field about 400 missionaries and 1,800 native workers.

In 1824, 10 strong men in the Lutheran Church, among whom were Neander and Tholuck, formed the Berlin Missionary Society; beginning operations, according to the wise continental practice, by opening a Training School for missionaries. It began to send out missionaries in 1834 and now carries on missions in Africa and China. Its working force in the field now consists of about 150 missionaries (wives of missionaries not counted) and 1,000 native preachers and teachers. Other Missionary Societies sprang up in Germany during the first quarter of the 19th century, at first as auxiliaries to existing boards. Several of them, like the Gossamer Society, the Hermannsburg, the Rhenish, the Leipzig, the North German, and the Breklam Society developed into independent existence, and these together had 510 missionaries in 1909 with 3,500 native preachers and teachers in the Dutch East Indies, Africa, India, China, and Australia.

The same period saw the formation in France of the Paris Evangelical Missionary Society

(1824), designed at first merely to aid existing enterprises, but quickly beginning to send out missionaries of its own. In 1909 it had 190 missionaries, men and women, and 1,000 native workers, in Senegambia and the Barotse and Basuto regions of Africa. With the development of French colonial expansion it has also taken the place of the London Missionary Society's missionaries in Tahiti and in parts of Madagascar, and of American missionaries in the French Kongo region. Protestant missionary societies in Denmark, Sweden, Norway, and Finland sprang later from the same causes and are doing good work in Africa, India, China, Chinese Turkestan, and Madagascar.

The same spiritual awakening of widespread effects gave rise also to the British and Foreign Bible Society (1804), the American Bible Society (1816), the Netherlands Bible Society, the Religious Tract Society of London (1799), and the American Tract Society of New York (1820). The Bible Societies do true foreign missionary work in publishing the Scriptures as soon as missionaries have translated them into the languages of non-Christian peoples, and in disseminating the Scriptures in these languages. Some 400 modern translations have been published. The British and Foreign Bible Society in 1909 had 30 agents employed in non-Christian lands with 1,500 native colporteurs and Bible women, and its total issues (at home and abroad) of Bibles, New Testaments and lesser parts of Scripture amounted to 6,000,000 copies. The American Bible Society has 20 agents, 600 native colporteurs in mission fields, and issued in 1909 some 2,100,000 copies. The Scottish National Bible Society issued in the same year 700,000 copies, besides joining with the first named Societies in providing finances for translating and publishing the Bible in various languages.

The Tract Societies aid missions in a similar manner; providing funds for the publication of undenominational Christian literature in the languages of non-Christian peoples. The Religious Tract Society of London at its Centennial Anniversary was able to report that it had given for this purpose to English and American Foreign Missions aid equivalent to \$100 per day during the whole period of its existence.

In the second quarter of the 19th century the American Methodist Episcopal Church and the American Presbyterian Church began their missionary work in foreign lands. Almost all denominations in the United States and in Great Britain now have Foreign Missionary organizations of their own, and since the middle of the century the British colonies in Canada, India, Australia, South Africa, New Zealand and the West Indies, and to some extent the Dutch colony in Java, have begun foreign mission enterprises of their own. Interdenominational and international Missionary Societies, like the China Inland Mission, the North Africa Mission, the Christian and Missionary Alliance and other bodies of greater or less importance have been formed to carry on missionary enterprises by methods more free from machinery than the older Societies sometimes seem to require. The total number of Protestant Missionary Societies now existing is difficult to ascertain with accuracy. It probably exceeds 500. According to Beach ("Geography and Atlas of Foreign Missions") (1902), these Societies employed 16,613

MISSIONS

missionaries of both sexes and 75,381 assistants who are native in the regions where they work.

Three points are especially noteworthy, in the history of the development of these Missionary Societies, as each marking an epoch of expansion in the scope of Protestant Missions. These are: (1) The adoption of education as a missionary agency; (2) The general adoption by women of mission work for womankind; (3) The establishment of medical missions.

1. *Education.*—The aim of Foreign Missions is to tell of Jesus Christ to those who do not know Him. The aim is to lead them to surrender self-will to the control of Jesus Christ so completely that converts shall be true Christians, who, if the missionary leaves to-morrow, will stand immovable in their devotion and their impulse to teach others the truth that has benefited themselves. At the outset the task seemed simple enough. To preach and preach again was all that was necessary. As a result of the first half century of experience, the discovery was made that common schools are essential in all missions which urge the reading of the Bible. Rev. Dr. Alexander Duff, a missionary from Scotland who has left ineffaceable marks upon India, was a leader in championing the thesis that education in all grades is also a legitimate and essential department of missionary effort. This principle is now established with all that it means of general enlightenment for backward races, and in 1909 there were in the Protestant missions throughout the world nearly 30,000 educational establishments of all grades from kindergarten to university, attended by about 1,500,000 young people of every form of religious belief.

2. *Women's Work.*—As early as 1825 missionaries undertook the education of girls in India, Africa, Turkey and elsewhere. In 1835 a Woman's Missionary Society was formed at Berlin, Germany, for the instruction of women in the East; and later schools for girls were opened in several non-Christian lands by different missionary societies. It was not until 1860 that the women of Christian lands began to take the matter into their own hands. Beginning with the Woman's Union Missionary Society of New York (1860), mission boards of women were organized in almost all the Protestant denominations of Great Britain, Canada, and the United States. These missionary societies of women are for the most part closely allied to the general missionary boards of the denominations to which they belong, but they send out women as missionaries and have produced another vast extension of the scope of the missionary enterprise. The impossibility of carrying on successful missions without women missionaries to win and instruct their own sex is

now fully recognized. There were in 1909 about 3,000 unmarried women working as missionaries in all parts of the non-Christian world. No mission field is so dangerous or so repellent in its barbarism as to be denied the ministering service of devoted women of Christendom.

3. *Medical Missions.*—The science of missions has grown out of experience. At the outset physicians were sent to the missions with the primary duty of caring for the health of missionaries. They could not, however, fail to use their knowledge for the relief of suffering in lands where surgery was unknown and the art of medicine parodied by natives. In 1841 the "Edinburgh Medical Missionary Society" was formed to increase the number of such physicians. It was not until about 1885 that the Medical Mission was fairly established as a recognized channel of missionary influence. Since that time the number of missionary physicians, both men and women, and of missionary hospitals and dispensaries has increased every year. Beach in his 'Atlas of Protestant Missions' (1902) gives 898 as the number of such hospitals and dispensaries in Asia, Africa, and Oceania, and the number of patients who receive treatment each year is more than 2,500,000. The enormous broadening of the influence of Foreign Missions need not be emphasized which results from their entering upon the training of children, the enlightenment of women in the seclusion of the home, and the healing of the sick who without this ministration would suffer and die.

Results of Foreign Missions.—Nothing like full statistical tables of these numerous missionary societies would be possible were it not that more and more the various denominations regard all missionary enterprises as essentially one. Fifty years ago the missionaries of different denominations in India began a practice of holding conferences together to plan for the more effective prosecution of the common work. Such conferences of missionaries are now held regularly in India, China and Japan. More than this, the missionary societies of Europe and America have adopted the same plan. General conferences of the societies have been held with great mutual advantage, the most notable of these being the Conference of London in 1888 and the Ecumenical Conference of New York in 1900. The German missionary societies confer together each year, and so do the secretaries of the British societies. So do those of some 40 societies in the United States and Canada. The result is steady advance toward a more economical management of all missions, marked diminution of possible friction between different denominations, and a fuller knowledge of the work that each denominational society is undertaking. The following statistics, which aim to cover the

	Communicants	Professed Christians including children of converts	Missionaries (men and women)	Native workers (men and women)	Places of worship	Schools of all grades	Hospitals and dispensaries
American Continents, including Greenland and West Indies...	150,039	514,514	2,851	6,413	3,574	1,169	17

work in non-Christian lands of all missionary societies, are compiled in the main from Beach's 'Atlas' (1902) with some later additions.

Figures are proverbially uncertain agents for setting forth facts. In the statistical tables of missions the enormous areas from which they have to be gathered ensure that before they can be collated and put in print they are already stale. Leaving this out of account there remains the need to caution in deductions based on mere figures. The enthusiast may forget, on seeing the number of converts recorded, that there is no miraculous short cut by which the pagan savage may be transmuted into a gentleman of ethical and intellectual perfection. In any groups of people instructed and changed through missionary effort the majority are and will long remain infants in growth. As in Christian so in non-Christian lands a minority only grow so far as to do things that give them weight in valuations of the community. On the other hand, doubters may easily put too low a value upon such figures and rate these converts as worthless because they are mere fallible human beings. Events have tested converts from paganism in India, Africa, China, and in fact in all mission fields, with the result of showing that sincerity, unselfishness, and stability exist among them. Men from the lowest have risen to the highest ability, like the slave-boy Crowther of Yorubaland, and Constantine of Turkey whose Hebrew and Greek scholarship made them notable among Bible translators; or like Abdul Masih and Imaduddin of India, converted Mohammedans whose work in the Christian ministry proved them masters of Christian apologetics; or like Dr. Saleeby of the Philippine Islands, the assistant commissioner for dealing with the Moros of Sulu, whose origin was in an obscure village of Mt. Lebanon in Turkey, and whose qualifications for his high office were gained in the American Missionary schools of Syria. Men and women of humble surroundings in all the non-Christian lands have been transformed from superstitious and morally degraded barbarians into useful members of the race, of a purity of life that would be noteworthy in the most favored lands. And their influence is great in accord with this fact. The increase of the population of British India in the decade 1891-1901 was about seven per cent, while the increase of the number of Christians in India during the same period was about 30 per cent. In Uganda in central Africa the number of converts baptized by the missionaries of the Church Missionary Society in 1902 was about 4,000. In both of these cases all testimony agrees in showing that the increase is largely the result of the influence of the pure lives and the active and earnest convictions of natives previously converted. Of the 100,000 converts added in 1902 to the communion of Protestant missions in all parts of the world it is probable that more than half were led to Christianity in the same way. Such examples tend to show that the influence of missions is cumulative upon the people among whom they are established, and in this case the figures of statistical tables have a weight which may be easily underestimated.

Much might be added in respect to the effect of missions in extirpating degrading, immoral, and cruel customs, like cannibalism, or widow-burning, or human sacrifice and in elevating the standing of womankind everywhere, and in

endowing illiterate languages with alphabets and the beginnings of a literature, and in teaching peoples to be producers who have been mere parasites, living by the sword on the industry of others. Much might be added on the indirect influence of missions in adding great areas, as in the islands of the Pacific, and in Africa to the fields of the world's commerce and in producing a general moral and intellectual uplift as in India and China of peoples who have not accepted the religious message of the missionary. The aim of foreign missionary enterprise is so beneficent and its agencies so thoroughly devoted to the aim; it is conducted on so broad a view of the scope of its purpose; its methods have been so perfected by experience and conference, and it so surely penetrates to the deepest sources of social evolution among the masses with whom is the reserve vitality of every nation, that it must be taken into account in reckoning up the agencies by which Europe and America are shaping the destinies of the great and mysterious East.

Bibliography.—For statistics and history: Warneck, 'History of Protestant Missions' (1901); Dennis, 'Centennial Survey of Foreign Missions' (1902); Beach, 'Geography and Atlas of Protestant Missions' (1901-3); 'Encyclopedia of Missions' (1904). For Sociological relations of Missions and the methods in use: Dennis, 'Christian Missions and Social Progress' (1897-9); 'Report of Ecumenical Missionary Conference' (1900); 'Report of the Centenary Conference on Foreign Missions' (1888). For views of separate missions and different countries, the volume of books is so great as to make selection almost invidious. A few good recent works are: (for India) Jones, 'India's Problem' (1903); (for Siam) Curtis, 'The Laos of North Siam' (1903); (for Turkey) Dwight, 'Constantinople and its Problems' (1901); (for the Philippines) Brown, 'The New Era in the Philippines' (1903); (for Africa) Stewart, 'Dawn in the Dark Continent' (1903). Histories of the larger Missionary Societies also contain a mass of valuable information respecting the mission fields: 'History of the Church Missionary Society' (1899); 'History of the London Missionary Society' (1898); 'Two Hundred Years of the S. P. G.' (1901).

HENRY OTIS DWIGHT,
Bureau of Missions, New York.

Missions, Protestant Home. Home missionary effort in the United States is older than its organized form. Before the War of the Revolution individual churches in New England and New York were sending their pastors, for weeks or months at a time, into the new settlements, to preach the Gospel and administer the ordinances of religion. Connecticut pastors received for this service \$4 a week, and \$4 more were allowed for the supply of their pulpits, the money being raised by voluntary subscriptions among the home churches. These desultory efforts continued more or less intermittently for 25 years: they were warmly welcomed by the struggling settlements and were influential in preparing the way for better organized endeavors.

Organized American home missions began with the establishment of the 'Missionary Society of Connecticut,' 21 June 1798, by the Congregational churches of that State. Massa-

Massachusetts Congregationalists followed one year later, 1799, with the "Massachusetts Missionary Society." Both of these Societies, bearing the names of the States where they originated, and supported by the States whose names they bear, were not primarily for the benefit of Connecticut and Massachusetts. The object of the Connecticut Society, as stated in its charter, was "to Christianize the heathen (Indians) of North America and to support and promote Christian Knowledge in the New Settlements of the United States." The charter of the Massachusetts Society describes its object as being "to diffuse the Gospel among the heathen (Indians) as well as other peoples in the remote parts of our country." Both Societies, therefore, while local in their origin and support, were truly national in spirit and aim. Other New England States followed the lead of Connecticut and Massachusetts in organizing similar societies; New Hampshire in 1801, Rhode Island in 1803; Maine and Vermont in 1807, all of them under Congregational auspices. They all continue to the present time with but slight changes in name, and with increasing devotion to home missions, State and National. The first organized movement on the part of the Baptist churches was made in 1802, when the "Massachusetts Domestic Missionary Society" was established at Boston, with the same broad object as its Congregational predecessors, namely: "to furnish occasional preaching and to promote the knowledge of evangelistic truth in the new settlements of these United States, or further, if circumstances should render it proper." To the same year 1802, belongs the first systematic effort of the Presbyterians of New York, Pennsylvania, and New Jersey, acting under the same broad charter with those of the Congregationalists and Baptists of New England; "to send forth missionaries well qualified to be employed in mission work on the frontiers, for the purpose of organizing churches, administering ordinances, ordaining elders, collecting information concerning the state of religion in those parts, and preparing the best means of establishing a Gospel ministry among the people." Meanwhile the Reformed Church of America had not been idle. Sporadic missionary work began with it as early as 1786, culminating in 1822 in the organization of the "Missionary Society of the Reformed Dutch Church," differing nothing in spirit from its forerunners, but with a wider scope, as it included home and foreign missions under a single organization. Methodist and Episcopal missions, as well as the Lutheran and those of the Disciples of Christ, belong necessarily to a later period.

It is important, historically, to remember that all these early missionary bodies were called into being by one motive and for one object. Barbarism in the new settlements was the common dread of the East, and to prevent such a disaster by pre-empting those rapidly gathering communities with religious institutions was the motive of all early home missionary organizations. At the opening of the 19th century, what was known as the new settlements were found mainly in northern New England, eastern and central New York and northern and southern Ohio, and these were the first points of home missionary attack. The opening of the Northwest Territory and the passage of the Ordinance of 1787 attracted a stream of emigration

from the East, mingling with which was a considerable element from Great Britain, Holland, Scandinavia, Germany and Moravia, Belgium and Switzerland. The earlier settlers in New York, Ohio, Indiana and Illinois were generally Protestant in their sympathies, but unable at once, with a new country to subdue and new homes to be built, to provide themselves with the institutions of worship. To the help of these hopeful but destitute settlers came the missionary organizations of the East. Their missionaries were hurried forward to every needy point, not only in the wilds of New York and Ohio, but to the remoter settlements of Indiana, Illinois, Kentucky and Tennessee. They even found their way down the Mississippi to New Orleans and crossed the northern borders to Canada. A specially promising field of effort was a section of Ohio, bordering on Lake Erie, settled chiefly by emigrants from Connecticut and for this reason commonly known as "New Connecticut." At the beginning of the century the tract contained about 1,400 inhabitants. In 1804, it had 400 families; one year later the 400 had become 1,100, one half of them from New England. In less than thirty years from the beginning of organized home missions 90 churches had been planted, all of them by home missionaries sent out and supported by Connecticut and Massachusetts. To sum up in a sentence the work of the Missionary Society of Connecticut at the end of 30 years, 200 missionaries had been employed whose joint labors were equivalent to 500 years of ordinary service by one man, and 400 churches had been established in the new settlements of the land. With what wear and tear of body, with what sacrifice of comforts in the wilderness, with what patience of hope and courage of faith and labors of love, no words can fitly portray. Not a mile of railroad had been built. The river and the canal, the stage coach, the emigrant wagon, and the saddle, were the only conveniences of travel, and to these the missionary added foot-sore and weary tramps from settlement to settlement. During the same period 125 Puritan churches had been gathered in the growing settlements of New York State, supported in whole or in part by home missionary funds.

All these earlier efforts were marked by a commendable absence of the sectarian spirit. A common danger threatened the nation. The problem presented to the churches of the East was how to overtake the new and rapidly multiplying settlements with the means of Christian civilization. No rivalry entered into the struggle, but only a strong sense of the need of prompt, united action. In their love of humanity and of country every thought of denominational supremacy was buried under the all absorbing issue whether the New America should be heathen or Christian. This spirit was particularly active between Presbyterians and Congregationalists which were then the strongest church bodies in the land; for 50 years, between 1801 and 1851, they carried on their missionary work in the new settlements under a "Plan of Union," mutually agreed to, by which the churches of either order, wherever formed, might worship in the same house, listen to the same pastor and profess the same creed, while at the same time they were left free to govern themselves by the polity they loved and preferred.

In 1820, Congregational, Presbyterian, Reformed and Associated Reformed churches, united at New York city in organizing a National Society. Such change of policy had become necessary. Hitherto, State Societies had been doing national work, each in its own way. But several missionary organizations working independently had resulted in an unequal distribution of men and money. Some sections had been over-supplied and others were left destitute. Moreover, the laborers themselves came into conflict with each other. The time had arrived for federation and co-ordination of effort, and to this end the American Home Missionary Society was organized, as above stated, with headquarters in New York city, the various State Societies making themselves auxiliaries to the National organization. Perhaps nothing more potential in the progress of American Home Missions belongs to its history than this act. For years the churches making the alliance labored together in fraternal unity, contributing to a common treasury and governed by a single board of direction. Receipts rapidly increased, the missionary force doubled and trebled, and instead of being an itinerant preacher, the home missionary became a settled pastor, dwelling among his people. It was only when these allied church bodies had grown strong that they withdrew one by one to organize separate Societies, leaving the Congregationalists to inherit the name and traditions of this honored organization. Indeed, it was not until many years later that "American" was dropped from its charter name and the designation of "Congregational" was substituted. Meanwhile the Methodists had organized their "Missionary Society" (national) in 1819, including home and foreign work; the Episcopal Church, its "Domestic and Foreign Missionary Society," in 1821; the Baptists, their "American Baptist Home Mission Society" in 1832, also national; the Lutherans, their "Home Missionary Society of the General Synod" in 1845, and the Disciples, their "American Christian Missionary Society," in 1849. The Southern Presbyterians, Southern Baptists and Southern Methodists have also their home missionary organizations which are doing a great religious work in the Southern States. Thus, by natural evolution, all the leading church bodies of America have gradually become organized for home evangelization and a movement, which began in 1798 for the Christian enlightenment of the New Settlements, has developed into a system as broad as the national domain, by which the stronger churches of the land are sharing the burdens of their weaker brethren and strengthening those forces of Christian civilization upon which the safety of the nation depends.

The purchase of Louisiana (q.v.) 100 years ago imparted a mighty impulse to the missionary movement. That expansion gave us the mouth of the Mississippi and undisturbed possession of its entire course. It carried our western boundary from Lake Superior to the Rocky Mountains, doubling the national area by a stroke of the pen. Fourteen States and Territories have been carved out of the Louisiana Purchase. They include the great corn and wheat belts of America, and their underground treasures are among the richest of the world. Emigration from the East and Middle West began at once and has reached enormous proportions. It is

rivalled in volume only by the millions of foreign birth that have poured and are still pouring into this new and mighty West. By these movements a great missionary problem was presented which the organized home missionary army welcomed with zeal and have never wearied in their efforts to solve. The order of missionary progress through the Louisiana Purchase was strictly along lines of immigration. There is not a State in that vast tract which the home missionary did not enter while it was yet a Territory, and always in the first and feeblest stages of settlement. From Missouri to Iowa, from Iowa to Minnesota, Kansas, and Nebraska, thence to the Dakotas, and on from these points to Wyoming, Colorado, and Montana, and last of all, when the door was opened, to Oklahoma, until every State in this imperial purchase has been leavened with Christian institutions. Something of the volume of this work may be gathered from the fact that in 1895 over 27,000 Protestant churches were enumerated within the Louisiana Purchase, holding property to the value of \$58,000,000 and having 1,912,000 communicants, and, with rare exceptions, this church growth is the fruit of home missionary culture, begun, maintained and supported until the need ceased, by the missionary revenues of these Eastern Societies. The same process was repeated when about midway in the century the Oregon Treaty made sure our possession of the Northwest and the discovery of gold opened the Californias to the world. Home missionaries ordained in the East promptly started for the Pacific Coast, reaching their fields by the way of Cape Horn and the Sandwich Islands. The strategic position of the far West and Northwest as related to the work of foreign missions in China and Japan was keenly appreciated by the churches and their missionary boards at the East. Money was contributed freely and many of the ablest preachers of the East went forth cheerfully to lay the foundations of Christian society on the sunset shores of the Republic. "The Mexican Cession," including Texas, New Mexico, Arizona and Utah, was another belt of peculiar missionary need, which in spite of ancient superstitions and modern delusions, has proved a rich field of rewarding home missionary effort.

The close of the Civil War introduced, at the South, a home missionary problem that was absolutely new, and which continues to absorb the interest of northern churches to an extraordinary degree. Four million slaves were suddenly set free. Government opened its bureaus of relief, and the churches of the North through their missionary boards hurried forward preachers and teachers. The greatness of the opportunity quickened the home missionary spirit of the whole country. Several of the boards opened freedmen's departments and the churches magnified the privilege of responding to their appeals. To the missionary, himself, there was in this call an element of peril which, so far from deterring him, only stimulated his zeal. The Yankee preacher and teacher were not well received at first by the white South. Social ostracism was not the only penalty they had to face for their devotion. Violence to their persons and destruction of their property were not infrequent in the early years of this missionary endeavor. An ugly spirit of caste included the negro teacher with the negro, and young women delicately reared in the best homes

MISSIONS

of the North suffered from neglect or open indignity. These conditions have mostly passed away; respect, and even gratitude, on the part of the South, have been won, as the fruits of this vast home missionary effort have become more apparent. These fruits appear not only in organized churches for the negro race, but in a long array of universities, colleges, academies, normal, common, and industrial schools, planted exclusively for the benefit of the blacks, all of them specifically Christian, and all of them originally supported by the free-will offerings of northern churches. Howard, Hampton and Fiske, Atlanta and Tusculum, Talladega and Straight, Shaw and Richmond, Wayland and Leland, Nashville and Bishop, and a host besides, are names as familiar to the educational world as Harvard, Yale, or Princeton. They are all the fruit of negro emancipation and all of them are the creation of home missionary interest and enterprise.

It was in 1840 that foreign immigration began to attract the attention of the friends of home missions. Up to that time its entire volume from all sources had not exceeded 500,000. Then began the flood. During the next 30 years the country received about 6,000,000 foreigners. Driven by famines and oppressions at home and drawn by the opportunities of labor in a new country and by our generous homestead laws, they were arriving, for continuous years, at the rate of from 500 to 1,000 per day. Between 1865 and 1885 more than 7,000,000 were added to our foreign population, which means that in these 20 years foreign immigration exceeded that of the entire previous record of the country. It is needless to say that, as this vast problem began to be measured and sanely comprehended by the churches, the appeal of home missions was almost revolutionized. Hitherto that appeal came from our own people and often from our own kin. To follow close after them on the westward trail and to stand with them in planting the church and the school had been for years the whole of home missions. While this feature has never lost its claim and probably never will, another claim has entered to divide the attention and concern of the churches. To the peril of domestic heathenism has been joined the larger fear of imported barbarism, and thus for many years foreign missions at home has come to be a distinct interest of American Home Missions. All branches of the church have taken part, through their organized societies, in this effort to Christianize the alien. No nationality has been overlooked; Germans and Scandinavians, Bohemians, Poles and Russians, Hollanders and Hebrews, Spanish, French, Italians, Armenians, Chinese, every sort and condition of foreigner, however forbidding or hopeless, has been made the object of home missionary culture, with results that have astonished the most sanguine believer and rebuked the most despairing doubter and which have all but silenced the prophets of evil who predicted the direst consequences from the infusion of so much foreign blood into the moral, social, and political life of the nation. Many times over it has been demonstrated that every grade of foreign immigrant is susceptible to religious development and is entirely capable of being both civilized and Christianized, and is in fact being rapidly assimilated, through the agencies of education and religion, into the best types of

American life. Great migrations are not feared to-day as they were in 1840. Fears have been quieted and the native American stock have come to view with less and less alarm, what 50 years ago almost crazed them with apprehension.

To attempt any adequate summary of the results of Home Missions at the end of 100 years, would require a survey of the development of 50 States and Territories, so vitally have the home missionary and his work entered into the beginnings and the early history of all our Commonwealths. A few salient facts must suffice. The vitality of the home missionary idea has shown itself, first of all, in the growth of organizations. Beginning in 1796 with the Connecticut Missionary Society it has multiplied itself into more than 30 home missionary bodies, all Protestant, all evangelical and all national. These organizations have collected and disbursed \$140,000,000. Their chief agent has been the Church, with its ordained preacher and its divinely appointed ordinances, and for the Church, these millions have been given. This total, however, takes no account of co-operating agencies, which have been called into being to serve the missionary work of the churches. Add these: Sunday School planting; Bible and Tract printing; Church building and Christian education; which by careful inquiries are found to have expended \$150,000,000 more, and the grand total for Home Missions, root and branch, in organized form, is \$290,000,000. Not a dollar of this immense fund has been paid in any commercial sense for value received. All of it has been given, a free-will offering of Christian people to mark their intense conviction of the peril of a nation without the Gospel, and their supreme faith in its leavening power. What have these millions accomplished and what of visible fruits remain to justify their cost? It is a fact not generally known, and when known not sufficiently appreciated, that the great evangelical bodies of the United States trace most of their church organizations directly to Home Missions. Congregationalists admit that four fifths of their churches are of home missionary origin. The proportion would be larger but for the fact that hundreds of their churches were born before home missions began. Presbyterians confess that nine tenths of their churches are of home missionary planting. Baptist, Methodist and Episcopal estimates range from five sixths to nine tenths. Such ratios can mean but one thing; that these far spreading ecclesiastical bodies have become strong in church power, not by their own help but by home missionary aid, the few, strong, bearing the burdens of the many, weak, and they answer the inquiry which suggests itself at once to a thinking mind: where and what would these ecclesiastical establishments be to-day but for the helpful agency of organized Home Missions? To the credit of home missions, therefore, should stand the undoubted truth, that an overwhelming majority of the evangelical churches of America owe their being to its nurture and care. What does such a fact mean in the religious development of the country? In the year 1899, the United States had one evangelical communicant in 14.50 of the population. In 1850 that ratio had grown to one in 6.57; in 1870, to one in 5.78; in 1880 to one in 5; in 1890, to one in 4.53; and in 1900, to one in 4.25. In other words, evangelical church membership increased three and one half

times faster than the population, in less than 100 years. Between 1800 and 1890, population increased 11.8 fold; in the same period evangelical church membership increased 38 fold. To these figures, Dr. Daniel Dorchester, their compiler, adds the comment: "This exhibit of religious progress cannot be paralleled in the history of God's kingdom in any land or any age." It is only 130 years since Voltaire in Geneva declared: "Before the beginning of the 19th century Christianity will have disappeared from the earth," and it is less than 100 years ago that American infidels were prophesying that the Church would not survive two generations in this country. In defiance of these dismal auguries between 1800 and 1890, the average yearly increase of evangelical communicants was 63,302; between 1850 and 1870, 20 years, 157,170; between 1870 and 1890, 10 years, 339,258; between 1880 and 1890, 10 years, 375,705, and during four years, between 1890 and 1894, 348,582, the prophecy of a larger average than ever for the last decade of the century. It is no vain boast, therefore, but the obvious truth, that by far the larger part of this remarkable growth is due to the direct agency of American Home Missions, since in its own carefully planted gardens most of this growth has taken place. But not the only, nor even the highest, fruits of home missionary effort are contained in these numerical results. President Roosevelt, in a recent public address, declared: "It is such missionary work that prevented the pioneers from sinking perilously near the level of the savagery against which they contended. Without it the conquest of this continent would have had little but an animal side. Because of it, deep beneath and through the national character, there runs that power of firm adherence to a lofty ideal upon which the safety of the nation will ultimately depend." Thus Home Missions has been in a very true and high sense both the builder and the savior of the American nation. In a government of the people and by the people, nothing counts for so much as high ideals of duty. With these enthroned in the thought and life of its citizens a nation may meet any shock from within or from without: and nothing has yet been discovered on earth or revealed from heaven that has the power to create higher ideals of duty than Christianity and the obligations it inculcates. It is thus that missionary societies, whose sole function is the planting of churches, enter into the hidden life of a nation in ways that political parties can never enter, and which even Christian men are sometimes slow to appreciate. Not only law, order, temperance, respect for the Sabbath, security of life and property, and the claims of humanity, are thus conserved and fostered, but the instinct of patriotism itself, in which the very life of the nation consists, finds its nursing mother in the Church of Christ. Many victories of a Christianly educated public sentiment might be cited in American history, but the Civil War of 1861 furnishes a typical example. When that inevitable conflict came the value of 65 years of church planting by American Home Missions in the East, the West, and the Northwest, began to appear. Every home missionary pulpit flamed with patriotic fire and summoned its worshippers to arms. Congregations and Sunday Schools were decimated by enlistments. From a careful inquiry made near the close of the War it was ascer-

tained that the home missionary churches of the entire West, on both sides of the Mississippi, "had sent into the army one in four of their entire male membership, including in the count old men, invalids, and boys." Commenting on this fact that peerless interpreter of history, Richard Salter Storrs, was moved to declare in his Brooklyn pulpit, "Home Missions saved this country once, and will save it again if necessary."

JOSEPH B. CLARK,
Secretary Congregational Home Missionary Society.

Missions, Roman Catholic Church, Home and Foreign. A complete account of the Missions in the Roman Catholic Church would be coterminous with the history of the growth and progress of Christianity, for the Church is essentially missionary. The commission that was given to the Apostles, by the Founder of Christianity, was not to establish a system of philosophy, nor even to maintain a ceremonial form of worship, but it was, "Go ye into the whole world and preach the gospel to every creature." For the first time in the history of the world was there conceived a project of forming a worldwide institution, that would embrace all nations under one headship, no matter how divergent their ideas or their racial traits. The measure of the universality of the Redemption was the fact that the Church was not to be national or racial, but it was to be Catholic or Universal, for all peoples and for all ages. It was designed to be the continuation of the beneficent work of the Incarnation of the Son of God "unto the consummation of all things." To create this worldwide institution, the primary business of the Apostles, and their successors, was to preach the gospel to every creature, and the highest vocation of the Church therefore is the missionary vocation.

It would be difficult, then, to give anything but a meagre sketch of the efforts that were

put forth to widen the saving influences of the Church, and the ultimate crystallization of the fruits of these efforts into the marvelously complex organization, whose centre is in Rome and whose ramifications extend to the uttermost ends of the earth.

The history of the work of the Missions begins on the first Pentecost in the market place of Jerusalem, wherein were gathered representatives from all the nations of the earth. The providence of God had prepared the time and the place through a thousand years of effort, first by preserving the monotheistic idea of God among the Jews, second, by importing Greek culture and intellectuality (it was no mere accident that led to the translation of the sacred writings of the Hebrews into the Greek Septuagint), and third, by creating the great civil organizations of the Roman Empire, whose well-made roads led to the pillars of Hercules on the west and to the waters of the Danube on the east and beyond. The same providence of God that had prepared the soil, selected the special psychological moment for the seed-sowing, and on the first Pentecost, Peter stood up in the midst of that throng in the market place, and preached the first great missionary sermon, a verbatim report of which is given to us by Luke the Evangelist and in Greek, too, that all the world might read it (Acts ii.). There were 3,000 converts made that day. The same chronicler tells later on of the missionary journeys of Paul and of the many neophytes that were baptized into the Church. Finally both Peter and Paul came to the city of Rome, and there the Prince of the Apostles set up his throne under the shadow of the throne of the imperial Caesars, and there it has remained ever since, and out from Rome, and with the authority of the Roman Pontiffs, have gone the missionaries that have converted the heathen world to Christianity. Into Italy they went, and beyond into Gaul and Hispania and into the forests of Germany, and along the Danube into the regions of Eastern Europe. Before three centuries went by, the missionaries with Roman Catholic ordination celebrated the divine mysteries and with Roman Catholic consecration exercised ecclesiastical jurisdiction, and after they had preached Roman Catholic doctrine and had gathered the fruits of their labors, they brought them to the feet of the Roman Pontiff for his blessing. A good type of this work is seen in the conversion of Britain. Pope Eleutherius (176 A.D.) sent Fugatus, and Damianus to Britain at the request of Lucius, a British chieftain, and an incipient hierarchy was established. (Bede. I., ch. iv.); (Tertullian, 'Adv. Hæc.' 1.)

During the persecution of Diocletian (303 A.D.) many Christians in Britain were done to death and the British Martyrology was headed by the illustrious Saint Alban. The happy effect of the change that was wrought by the edicts of Constantine was a source of joy in Britain, because Constantine's mother, Helena, was the daughter of a British prince, and his father, Constantius, was converted and died in the faith at York in Britain. (Euseb. in 'Vite' 17.) When the Pelagian heresy began to disturb the faithful of Britain at the instance of the deacon Palladius, Pope Celestine sent Germanus of Auxerre, in his own stead, to drive out the

heretics. (Saint Prosper's 'Chronicle,' 429 A.D.) So with more or less fervor of piety (Gildas ch. vii.) Britain preserved the faith of the Roman Catholic Church, "entire, and inviolate" and maintained the succession of British bishops up to the time of Saint Augustine, whom Pope Gregory the Great (597 A.D.) sent to England to convert the Anglo-Saxon, and for a thousand years afterward all spiritual jurisdiction was from Rome.

The same story is true in Ireland: Saint Patrick was sent by Pope Celestine; Saint Boniface went into Germany with a similar message and authority; and in a like way Denmark and the Scandinavian peninsula were brought in subjugation to the yoke of Christ. The missionary went first, and as has been done in India and in China in the 19th century, then gradually the native churches began to grow in numbers, a bishop was sent with consecration and authority from Rome, and the nascent church assumed definite organization until in the course of time it grew into hierarchical perfection. Looking at the missionary work of the Roman Catholic Church from one point of view, there are no Foreign Missions, because she is a worldwide organization, at home in every land.

This work of evangelizing the countries of Europe went on with more or less ardor all through the Middle Ages. The barbarian races rushed in at the breaking up of the Roman Empire and while the military power was too weak to stem the onward rush, still the spiritual masters of the Church met them and chastened their fierce, warlike spirits, and made them submissive to law and order. The vast monastic system grew up. Canon Farrar says:

Under the influence of Catholicism the monasteries preserved learning and maintained the sense of the unity of Christendom. Under the combined influence of both, grew up the lovely idea of chivalry molding generous instincts into gallant institutions, making the body vigorous and the soul pure, and wedding the Christian virtues of humility and tenderness to the national graces of courtesy and strength. During this period, the Church was the one mighty witness for light in an age of darkness, for order in an age of lawlessness, for personal holiness in an epoch of licentious rage. Amid the despotism of kings and the turbulence of aristocracies it was an inextinguishable blessing that there should be a power which by the unarmed majesty of simple goodness made the haughtiest and boldest respect the interests of justice, and tremble at the thought of temperance, righteousness, and judgment to come.

The crusades were but great witnesses to the missionary power of the Church, and they did not a little to break the power of Islam, and save Europe from Mohammedan blight. In the 11th century came the great preaching orders, notably the Dominicans, and the Franciscans, and for the next three centuries the voices of these missionaries were heard in every corner of the civilized world. The fall of Constantinople and the consequent spread of the city's learned men through the West was a new leaven to awaken the European mind, and the invention of the astrolabe, together with the art of printing from movable types, gave a new impetus to the missionary movement. Columbus was filled with this spirit, and one of his deepest purposes was to find a shorter way to India and the East in order to bring the gospel to the people who sat in darkness and in the shadow of death. His expedition from Palos was a profoundly religious affair, and on his return from the newly discovered continent, he

MISSIONS

brought six dusky savages, who were duly instructed and baptized, and Queen Isabella stood at the font of baptism as their godmother. These six converts to Catholicism (1493) have become the 14,000,000 Catholics of the United States to-day. Other discoverers followed Columbus, and while their voyage was in many instances a search for the "Golden Fleece," yet they invariably brought with them missionaries, and wherever they landed their first act was to erect the cross, and gather the natives to listen to the tidings of salvation. The Cabots planted the cross on Cape Cod 120 years before the landing of the Puritans at Plymouth Rock. Champlain, who, as Bancroft says, "considered the salvation of one soul more important than the conquest of an empire," opened the Northwest to civilization. Cortez introduced missionaries among the Indians of Mexico; and La Salle, who had been trained in a Jesuit novitiate, brilliant, restless, daring, went by the way of the Great Lakes and down the Mississippi, and opened the West to missionary effort.

While the stories of the wonderful Western world were being whispered in Europe a little knot of ardent spirits gathered about Ignatius Loyola at Paris and plighted their vows to work for God. One of the number was Saint Francis Xavier, who within two decades preached to and baptized hundreds of thousands in India, and penetrated to the very gateway of China. During the 16th century fierce religious dissensions broke out in Europe, and the German and English nations were lost to the Church, but the Jesuit missionaries, together with the Franciscans and Dominicans, made a mighty recompense for the losses in Europe by the gains they secured in India among the Brahmans, in China among the Confucianists, in South America among the Indians, and in North America among the savages.

The 16th and 17th centuries were marvelous in the record of missionary triumphs. China had been a sealed book for 2,000 years, but "Where neither merchant nor traveler has penetrated the Roman Catholic missionaries have found their way." (Gutzlaff, 'China Opened,' Vol. I., ch. vi.) They brought to Europe exact knowledge of the hidden empire and they did it in defiance of every menace of torture and of death. In 1583 Father Ricci landed at Canton, and for 27 years, in the habit of a Bonze or a Literati, he pursued his way to the imperial throne, and baptized many princes of the reigning family. When he died, there were more than 300 churches in the different provinces (Gutzlaff, 'History of China,' Vol. II.), and by his public interment, with the emperor's official sanction, Christianity was legalized in China (Abbe Hue, Tome II.). He was succeeded by Father Adam Schaal, S. J., who taught the Chinese all they know of mathematical science, and later on by other missionaries. The storm of persecution came and "more than 300 churches were either destroyed or converted to profane uses, and more than 300,000 Christians were abandoned to the fury of the heathen" (Du Halde). The story of their dreadful sufferings, their fierce tortures, and their agonizing deaths reads like the acts of the martyrs in the early Roman persecutions. In the meantime the evangelization of the Philippines was going on. Three centuries of effort

has left six millions of the Malay race deeply imbued with the principles of Christianity, so that Peyton (Episcopalian) was able to write of them:

I found in all the towns a magnificent church. I attended mass several times, and the churches were always full of natives, even under unfavorable circumstances, on account of the military occupation. There are almost no seats in these churches, the services lasting from an hour to an hour and a half. Never in my life have I observed more evident signs of deep devotion than those I witnessed there—the men kneeling or prostrated before the altar, and the women on their knees or seated on the floor. Nobody left the church during the services, nor spoke to any one. There is no sectarian spirit there. All have been instructed in the creed, in prayer, in the ten commandments, and in the catechism. All have been baptized in infancy. I do not know that there exists in the world a people as pure, as moral, and as devout as the Filipino people. (Report of Philippine Commission.)

South America, too, had been traversed by the missionary, and the Indians of the Andes as well as the wild tribes of Paraguay had accepted the religion of Christ. Whatever the races of South America and of Mexico know of Christianity to-day, they have learned it from the missionaries of the Roman Catholic Church.

Since the year 1622 the work of the "Missions" has been so specialized as to make it a department of Church Administration. In that year Pope Gregory XV. canonically instituted the Congregation de Propaganda Fide, and gave to it the duties of church extension. The Cardinal Prefect of the Propaganda is second only to the Pope himself in power, for he has jurisdiction over all so-called missionary countries. The present prefect, the venerable Cardinal Gotti, is assisted by 25 other cardinals, and as many consultors, making a quasi-senate for the administration of church affairs. Affiliated with the Propaganda there are half a hundred colleges and seminaries for the education of the natives of the missionary countries, and in these colleges most of the languages of the civilized and uncivilized world are taught. The Propaganda had a polyglot press for the printing of literature.

In 1862 Pope Pius IX. instituted a special congregation for the affairs of the Oriental Churches, for the Roman Catholic Church exercises a jurisdiction not only in Europe but over portions of the ancient Eastern Churches whose beginnings are traceable to the Apostles other than Saint Peter, and claims a jurisdiction over them all through the primacy of Saint Peter. These Churches in communion with the Pope are united in a complete doctrinal life, that is, all and every one of the dogmatic teachings of the Roman Catholic Church are accepted by the adherents of these Eastern churches, though they are permitted to retain their ancient liturgies which may be peculiarly their own, and they are not obliged to conform in all matters of discipline, as, in some instances, a married clergy is permitted among them. A distinction has always been made between the acceptance of the dogmatic formularies and the toleration of varying rites and ceremonies. In the former the Church is most exacting, she never permits the least variation in the letter or the spirit of her teaching, but like an indulgent mother she permits her children to maintain their time-honored customs, liturgies, and languages.

MISSIONS

The Oriental Rites, under the administration of the Propaganda, are as follows:

1. The Ethiopian or Abyssinian Rite, principally in the Abyssinian Church, first planted by Saint Matthew, increased by Saint Frumentus, in the 4th century, was represented at Council of Florence 1445,—principal missionary of modern times Joseph Sapeto. It includes 30,000 souls.

2. Armenian Rite—gospel first preached by Gregory the Illuminator, though the modern Church was reorganized by constituting the Bishop of Cilicia as Patriarch of the Armenians. The liturgy is in ancient Armenian. It includes 109,000 lay members and 357 priests.

3. Coptic Rite—Church first established by Saint Mark, disciple of Saint Peter and bishop of Alexandria in Egypt. The people went into schism under Dioscorus, but later on were restored to the unity of the faith. The bishop of Alexandria is the patriarch; 22,500 members with 44 priests.

4. Greek Rite—subdivided into (1) Pure Greek in which the Greek language alone is used; (2) Rumanian Greek; (3) Bulgarian Greek, using the Slav language; (4) Ruthenian Greek, and (5) the Melchite Greek. The entire Greek rite in communion with Rome numbers 4,645,803 members with 5,251 priests. They have numerous seminaries and educational institutions.

5. Syriac Rite, subdivided into (1) Pure Syriac; (2) the Syro-Chaldaic; (3) the Syro-Malabaric, and (4) the Maronites. The Syrians number 626,029 with 1,171 priests. All these Oriental Rites together make a total of 5,433,332 members under the administration of many bishops and 6,823 priests. Many of these Eastern Churches have their seminaries for the training of their missionary priests in the city of Rome. Under the jurisdiction of the Propaganda, according to the official statistics published in 1898, there are:

Oriental Churches—5,433,332 members, 6,823 priests.

Occidental Churches—27,218,297 members, 33,148 priests.

The latter are distributed as follows:

	Members	Priests
England	1,364,489	2,674
Scotland	373,500	432
Ireland	3,547,979	3,443
Norway		
Sweden	9,750	74
Denmark		
Holland	1,854,340	3,168
Balkan Peninsula	666,210	890
Greece	34,710	109
Turkey	129,680	310
Peria	7,650	11
Arabia	1,500	11
India (Eng.)	1,870,000	1,180
China Indian (Peninsular)	827,680	823
Malay, Borneo, Java, Siam	57,890	80
Chinese Empire	532,448	1,168
Korea and Japan	84,410	772
Africa	458,170	1,015
British America	2,187,480	2,766
United States	9,479,250	10,049*
West Indies	339,200	295
Patagonia	99,500	70
Australia	704,170	236
Potynesia	196,850	348

* 11,289,710 population and 12,968 priests.—Official Directory.

This list does not include the Philippine Islands, Porto Rico, Cuba, Mexico nor any of the South American countries, as these countries were ancient dependencies of Spain, and therefore not under the Propaganda. The total aggregate under both branches of the Propaganda or the Missionary department of the Roman Catholic Church at the close of the century was over 32,000,000 with about 40,000 priests.

This statement does not take into account the large army of teaching orders of brothers and sisters, and native catechists, nor does it give any estimate of the educational institutions, hospitals and orphan asylums that are under the auspices of the Church in these countries. Some idea of the growth of the missionary work of the Church may be realized from the fact that at the beginning of the 19th century there were only 5,000,000 under the jurisdiction of the Propaganda, at the beginning of the 20th century there were over six times that number.

This account will be incomplete without some statement of the material resources by which the missions have been carried on. The Congregation of the Propaganda has vast funded resources amounting to \$135,000,000, the revenues of which are applied to the support of the work and the colleges under its care. Beside this there have grown up during the 19th century many auxiliary societies; the principal one is known as the Lyons' Society for the Propagation of the Faith. It began with the idea of assisting the poverty stricken missions in New Orleans under Bishop Dubourg, but it soon broadened its scope. It asked only a cent a week from its members, and during its existence (1822-1900) it has gathered and spent \$65,690,017. The 'Annals of the Propagation of the Faith,' the official organ of this society, is now issuing 300,000 copies every two months and in 12 different languages. There are 58 different religious societies of priests engaged in the work of the missions, together with 82 orders of Brothers who have no aspirations to the priesthood, yet are consecrated to missionary work, and 434 different orders of religious sisterhoods. These 574 different societies embrace a membership numbering very nearly 100,000 who have left all that this world holds dear, of houses, land, country, and the pleasures of the domestic hearth, and have sacrificed their lives in poverty, celibacy, and exile for the souls of the heathen and the unevangelized. Their consecration to this life is not for a few years, but they count it their greatest joy to spend and be spent till death comes, that the blessed name of Jesus Christ may be better known and more deeply loved.

Under the caption of Home Missions, a short account may be given of the missions to non-Catholics in the United States. The idea of the need of organized effort to present the teachings of the Catholic Church to the American people, is what brought together five priests, Isaac Hecker, Augustine F. Hewit, Clarence Walworth, Francis Baker, and George Deshon, who founded the organization known as the Paulist Fathers (q.v.). This idea was practically systematized in its present form by Rev. Walter Elliott, in September 1893, when he began, in Michigan, a series of missions in public halls and churches for the purpose of explaining the doctrines of the Catholic Church. These mis-

MISSIONS

shows to non-Catholics prohibited controversy and invited the spirit of inquiry by placing a "Question Box" at the door, into which were dropped all questions concerning the teachings of the Church which anyone desired to have answered. During the last 10 years the work has grown to vast proportions. While the Paulists inaugurated the movement in the United States, yet the work is the normal work of the Church, and therefore belongs to every branch of the service, particularly to the diocesan clergy. The leaders of the movement contemplate the placing in every diocese a band of talented preachers whose business will be extra-parochial, and whose duties will be to go into the towns and country places where the Church is weak, or does not exist, and arrange for the inauguration or strengthening of Church organizations. This band of diocesan missionaries will largely do the duties of a Church extension committee in the spiritual and missionary sense. The growth of this "Home Missionary Movement," after 10 years, has been such as to necessitate the building of the Apostolic Mission House, at the Catholic University at Washington. This institution will provide special lectures and instructions in missionary methods, and in this way will give training to the diocesan missionary. The legal organization which is financing the work, is the "Catholic Missionary Union," incorporated under the laws of the State of New York. Its president is the archbishop of New York, *ex-officio*, and there are six other directors. The practical effect of 10 years of this home mission work has been to give the American people a more correct view of the teaching and spirit of the Catholic Church, to eliminate antagonisms, and to make Church relationships more harmonious. It has also tended to increase, and this in no small degree, the stream of converts that has been flowing into the Church.

The growth of the Roman Catholic Church under the jurisdiction of the Home Missions during the last one hundred years has been one of the marvels of the 19th century. The following figures give some measure of it:—In 1800 there were 40 priests; in 1830 the number increased to 232; in 1850 to 1,800; in 1906 to 15,177. In 1800 the Catholic population was 100,000, in 1910 it is estimated at not less than 14,000,000. In 1800 there were but 25 churches; in 1910 there are 17,000. The value of church property, as given by census reports in 1850, was \$9,256,758; in 1860 it was \$26,774,119, a ratio of increase of 189 per cent, while the aggregate wealth of the country increased only 125 per cent. In 1870 it was \$60,985,565. In 1906 value of church property had risen to \$92,638,000.

While this external growth indicated by numerical strength and material wealth is very remarkable, the internal growth indicated by evidences of maturing organization as well as by signs of increasing spirituality, is none the less remarkable. The first flowering of the Church's inner life is the vocations to the religious orders whereby men and women accept the call to the life of the evangelical counsels. In 1790 there was one convent with less than 10 religious, in 1909 there are over 5,000 convents with more than 60,000 religious. This army of men and women devote themselves without

hope of worldly gain to the alleviation of the ills of humanity in the hospitals by the sick bed, in the tenements of the poor, in the slums among the depraved, in the asylums caring for the orphans and among the aged, who have been stranded on life's shore, without one cent of salary, contenting themselves with meagre fare, with short hours of sleep on a hard bed, and long hours of prayer and devotion to the sick and the poor and the wretched, because they know and are convinced that their reward will be very great in heaven. Many of these religious communities are offshoots of orders that have been established in the old country, but some are indigenous to the American soil. Noteworthy among the communities of men are the Paulist Fathers, founded by five converts, and among the women the Sisters of Charity, founded by Mother Seton, also a convert.

The growth in the Church in the United States of course is principally due to the great stream of emigrants, but not the least element of growth and present strength is the large number of converts who have been drawn to her through the conviction that she is the one Catholic and Apostolic Church. There are no accurate statistics of yearly conversions, but Cardinal Gibbons puts it in this way: "If the same ratio of conversions is preserved throughout the country as exists in the archdiocese of Baltimore, the yearly number of conversions would amount to 44,800 souls. To sum up the aggregate number of Catholics under the American flag is as follows: United States (Cardinal Gibbons' estimate), 14,000,000; Philippines, 6,600,000; Porto Rico, 980,000; Hawaii, 13,000; American Samoa, 3,000; Guam, 9,000, making a total of 21,625,000 souls under the jurisdiction of an apostolic delegate, a cardinal, 13 archbishops and 87 bishops.

REV. A. P. DOYLE, C. S. P.,
Secretary The Catholic Missionary Union.

MISSISSAGA INDIANS — MISSISSIPPI

Mississaga Indians, an American tribe of the Algonquian family residing in Ontario, Canada. The name refers to the eagle. They signed a treaty in 1764 with an eagle as their tribal mark. In 1746 the tribe was admitted to the Iroquois confederacy. There are upward of 600 of the Mississagas remaining. They live on small reservations in Ontario, are mostly Methodists, and are healthy, progressive, peaceful citizens.

Mississippi, one of the southern United States and the seventh admitted to the Union; situated between lat. $30^{\circ} 13'$ and 35° N., and long. $88^{\circ} 7'$ and $91^{\circ} 41'$ W.; extreme length, north and south, 332 miles; average breadth 142 miles, varying from 78 miles below lat. 31° N., to 189 miles on that parallel, and 118 miles on the north line; area, 48,610 square miles, being 1.61 per cent of the territorial extent of the United States. It is bounded north by Tennessee, east by Alabama, south between the Alabama line and Pearl River by the Gulf of Mexico, and from the Pearl to the Mississippi on the parallel of 31° N., by the State of Louisiana; and west by Louisiana and Arkansas, having below lat. 31° N. the Pearl River, and above that line the Mississippi, as the dividing lines. The Round, Horn, Ship, Deer, Cat, Pois, and several other islands lying outside of and forming the southern limit of the Mississippi Sound, belong to this State. It was admitted to the Union to Dec. 1817, and takes its name from the river which forms its western boundary for a distance of over 500 miles. There are 75 counties in the State. Pop. (1910) 1,797,114. The capital city is Jackson.

Topography.—Mississippi lies in two divisions, separated by a low broad watershed, the eastern rivers flowing into the Gulf of Mexico, and the westernmost streams emptying into the Mississippi. East of the ridge the surface of the State consists of broad rolling fertile prairies, the ridge itself is rolling and broken into narrow valleys where streams afford plentiful water supply, while to the west the land falls away into the low swampy lands of the Yazoo and the Mississippi rivers. The State is very low, the highest altitude being but 1,000 feet. The coast has a shore line on the Gulf of Mexico of 88 miles, or including the irregularities and islands, of 287 miles. In the eastern part of the State the prairies are covered with grass during the greatest part of the year. East of this prairie region extends a level but very fertile tract on the upper course of the Tombigbee River. In the northern district is a range of hills of moderate elevation, well wooded but devoid of undergrowth. These hills find their western limit in the Walnut Hills; and west of them, and between them and the Mississippi River, in about lat. $32^{\circ} 30'$, for a distance of more than 170 miles, north and south, and 60 miles extreme east and west, the country is occupied by immense bottom lands, produced and fed by the inundations of the Mississippi, constituting the so-called "Delta." Nearly all of this low region has been reclaimed by a system of levees, and is now rapidly being opened up and settled, and penetrated by railroads. The bottom lands are about 7,000 square miles in extent.

Rivers and Lakes.—Mississippi is well watered by the Homochitto, Big Black, Yazoo, Sunflower, and Tallahatchie rivers, all emptying

into the Mississippi, and the Pearl, Pascagoula, and Tombigbee, all emptying into the Gulf of Mexico. There are many small streams in all parts of the State, which, though inferior in capacity to those already noticed, are locally important, watering extensive districts and giving fertility to the soil. In the bottom lands are numerous lakes, bayous and channels, and in this district, along the Mississippi, levees are built by the State partly from a fund derived from a special tax on the land, and partly with moneys derived from the sale of swamp lands.

Climate.—The State lies in what is called the semi-tropic climate belt. The winters are short and mild, the mean temperature 45° F.; the summers are devoid of intense heat, the mean 81° , seldom reaching 100° . Ice from one to two inches thick forms in the northern part of the State. The elevation of the surface and the Gulf breezes render the climate delightful during most of the year. The annual rainfall ranges from 48 to 58 inches. The death rate is very low—12.5 in 1,000. The heaviest rains occur in late winter or early spring, when the warm Gulf winds meet the cold north winds. The average wind velocity for the whole year is seven miles per hour; the prevailing wind for January is north, while it is south for July.

Geology.—Mississippi is occupied wholly by deposits of the Tertiary and Upper Secondary formations, which, sweeping around from the southern Atlantic States, attain here their greatest width. Near the Gulf of Mexico the sands and clays of the latest periods are spread over the country, and further north the deposits gradually become of greater age. At Vicksburg the Eocene appears at the base of the river bluffs, and the upper portion of these is covered by a deep deposit of yellowish loam or loess, containing fresh-water and land shells. This extends over the country eastward, and attains a thickness of 60 feet or more. The Upper Secondary appears near Jackson, and occupies the northern portion of the State. Fossil remains of a gigantic marine animal resembling the alligator are found in the prairie regions. In 1909 the clay products of Mississippi amounted in value to \$798,350. There were six mineral springs reported, with an output of 257,200 gallons, valued at \$52,780.

Minerals.—Mississippi is not a mining State. Clay is the principal product, together with marl, phosphate rock, hydraulic lime, gypsum and coal. None of these minerals are worked to any considerable extent.

Flora and Fauna.—There are over 100 species of trees in the State, including 15 varieties of oak. There are cypress, poplar, long-leaved pine, tupelo, sycamore, persimmon, magnolia, holly, cucumber tree, sweet gum, black-walnut, and various species of hickory, elm and maple. Wild animals, such as the deer, puma, wolf, bear, and wildcat are still occasionally seen. Alligators occur in the Mississippi as far north as the mouth of the Arkansas, and in some of the smaller rivers; and most of the streams abound in fish. Paroquets are seen as far north as Natchez, and wild turkeys are still common.

Forestry.—There are about 32,000 square miles of timbered land in the State. The yellow pine ranks first among the forest trees, and extends northward from the coast for 150 miles. The hills, or bluffs along the Mississippi Delta,

MISSISSIPPI

extend to the prairie lands on the eastward, and afford numerous forests of oak, gum, poplar, tulip, ash, maple, and hickory, and a few pine trees. The prairies of the southern part are covered with the long-leaved pine. Only within recent years has the timber product been important. Nearly all the timber cut in 1900 consisted of yellow pine, and oak and other hard woods. Turpentine, resin, and other naval stores are no small portion of the product from the timber belt.

Agriculture.—The fertility of the soil and a favorable climate give to Mississippi eminent advantages as an agricultural State. Nowhere in the world are there such alluvial lands as the Mississippi bottom, or "Delta," contains—an alluvial plain in a mild climate, level as the surface of the ocean and of inexhaustible fertility; and this plain is only a small part of the fertile lands of the State. The table-lands of the north, the loams along the bluffs and banks of the Mississippi, the dark and heavy prairie lands, and the inland bottoms are of scarcely less fertility. The prairies, especially in the Tombigbee district, furnish excellent pasturage. Sugar is produced in the south, and cotton forms the great staple of a large part of the State. Maize and oats are grown everywhere, and wheat is sometimes, though not commonly, grown in the northern districts. All the fruits of temperate climates grow here in perfection; plums, peaches, and figs are abundant, and in the south the orange. The farms of Mississippi numbered about 273,820 in 1910, and were valued at \$330,295,000. Of this amount, \$79,580,000, or 25 per cent, represents the value of buildings, and \$250,715,000, or 75 per cent, the value of land and improvements other than buildings. The value of farm implements and machinery was \$16,726,000, and of live stock \$50,000,000. These values, added to that of farms, give about \$400,000,000 as the value of farm property. About 40 per cent of the farms of the State were operated by white farmers and 60 per cent by colored farmers. Of the white farmers, 65 per cent owned all or a part of the farms they operated and 34 per cent operated farms owned by others. The corresponding percentages for colored farmers are 17 and 84 respectively.

The following table shows the acreage, qualities and values of the principal farm crops for 1900 and 1910:

Crops	Acres	Bushels	Value
Corn (1910).....	3,232,000	66,256,000	\$41,741,000
Wheat (1910).....	5,000	70,000	81,000
Oats (1910).....	175,000	3,360,000	1,848,000
Cottonseed (tons, 1900).....	634,083	6,692,027	
Cotton (bales, 1910).....	2,897,920	1,313,798	47,340,314
Dry beans (1900).....	1,149	11,672	
Dry peas (1900).....	69,400	590,537	567,279
Rice (pounds, 1910).....	2,800	84,000	50,000
Potatoes (1910).....	9,000	765,000	719,000
Hay (tons, 1910).....	100,000	142,000	1,732,000
Tobacco (pounds, 1910).....	100	55,000	11,000
Peanuts (1900).....	5,853	95,738	89,350
Sweet potatoes (1900).....	38,169	2,817,386	1,458,490
Onions (1900).....	233	26,243	24,058
Miscellaneous vegetables (1900).....	50,356		2,807,652

The total value of Mississippi crops for 1910 was approximately \$85,000,000, with 5,611,000 acres under cultivation. The total value of live stock on farms in 1910 was \$42,657,000, of which

amount 33 per cent represents the value of mules; 25 per cent that of horses; 15 per cent that of dairy cows; 13 per cent that of other neat cattle; 7 per cent that of swine; 4 per cent that of poultry; 2 per cent that of sheep; and 1 per cent that of all other live stock. The following table gives the number of domestic animals on farms for the year 1900:

Dairy cows.....	309,318
Other neat cattle.....	574,038
Horses.....	229,331
Mules and asses.....	216,031
Sheep.....	236,470
Swine.....	1,290,498

Sugarcane in 1900 was grown by 26,300 farmers on 11,552 acres. From this area they sold 5,914 tons of cane for \$23,918, and from the remaining product manufactured 18,930 pounds of sugar, valued at \$893, and 1,413,219 gallons of syrup and molasses valued at \$618,975. The total value of sugarcane products was \$643,786. Sorghum cane was grown by 25,183 farmers on 15,734 acres, producing 3,366 tons of cane, and from the remaining product manufactured 1,162,269 gallons of syrup, valued at \$313,365. The total value of sorghum cane products was \$323,417.

The fruit product of the State for 1900 was as follows:

	Number of trees	Bushels of fruit
Apples.....	703,796	249,335
Apricots.....	5,109	772
Cherries.....	30,186	2,352
Peaches.....	1,856,748	252,305
Pears.....	177,824	36,923
Plums and prunes.....	689,053	66,793

Population.—In 1910 out of a total population of 1,797,114 in Mississippi, the colored population aggregated 908,000, or 50 per cent of the total. In 1850 the colored population was 52 per cent of the whole. How this condition arose is best illustrated by a table showing the increase in population from 1800 to 1850, as follows:

YEARS	White persons	Colored Persons		Total Pop.
		Free	Slave	
1800.....	5,179	182	3,489	8,850
1810.....	23,024	240	17,083	40,347
1820.....	42,176	458	32,814	75,448
1830.....	70,443	519	65,659	136,621
1840.....	179,074	1,306	195,211	375,651
1850.....	295,718	930	309,878	606,326

The total population of the State in 1860 was 791,305; (1870) 827,922; (1880) 1,131,597; (1890) 1,289,600; (1900) 1,551,270. Population in 1910, 1,797,114. The largest cities are Vicksburg (20,814 pop.); Meridian (23,285); and Natchez (11,791). Other important towns are Jackson, Corinth, Enterprise, Columbus and Carrollton.

State Government.—The State is governed under a constitution adopted in 1890. The governor is elected for a term of four years, and receives a salary of \$3,500 per annum. Legislative sessions are held biennially, beginning on Tuesday after the first Monday of January; but only the quadrennial sessions held in the leap years are unlimited in scope and terms, the other sessions can only deal with revenue and appropriations and such matters as the governor submits to them by message. The legislature is Democratic, each member receiving \$400 per

MISSISSIPPI

annum and mileage. There are 7 representatives in Congress. The State government in 1901 was Democratic. The legislature is composed of 145 representatives and 45 senators. There are three supreme judges, appointed for nine years by the governor, and circuit and chancery judges, appointed for four years. Voters must have resided in the State two years, in the election district one year. Registration is necessary, and the voter must be "able to read any section of the Constitution of the State; or he shall be able to understand the same when read to him, or give a reasonable interpretation thereof."

State Finances.—On 1 Sept. 1901 the total indebtedness of the State, including \$2,208,300 of debt for school funds, on which interest alone is paid, was \$2,811,300, and is nearly all held by State funds. The assessed valuation in 1910 was as follows: Real estate, \$231,889,588; personal property, \$109,028,544; total, \$393,297,173; and the tax rate, \$6 per \$1,000. The total receipts for the year 1901 were, \$2,436,048, total disbursements, \$2,229,996, leaving a surplus of \$206,052, and cash balance, \$828,453. The main source of income is a direct State property tax, which yields almost 85 per cent of the total income; of the disbursements in 1901, 30 per cent were for common school purposes and 15 per cent for redemption of the State debt.

Banks and Banking.—The first bank in the State was opened at Natchez in 1809. On 30 June 1909, there were 30 National banks in operation, with 3,810 depositors and \$1,269,597 in savings deposits. There were also 146 State banks, with 20,092 depositors and \$4,149,233 in savings deposits; 4 private banks, with 10,500 savings deposits; and 12 savings banks with 7,640 depositors and \$2,002,908 savings deposits. No loan and trust companies made report that year. (See 'Statistical Abstract of the U. S.')

Education.—Nearly all the cities and towns in the State maintain graded schools for ten months in the year. Separate schools are conducted for the colored race. In 1909 the chil-

Springs; Millsaps College, Jackson; and University of Mississippi (q.v.). Among the most notable women's colleges are the Industrial Institute and College, Columbus; Blue Mountain Female College, Blue Mountain; East Mississippi Female College, Meridian; and Stanton College for Young Ladies, Natchez. The State supports an agricultural and mechanical college at Starkville; a college for colored youth at Rodney, and a normal school at Holly Springs for training colored teachers. In 1910 there were 258 newspapers issued in the State. In 1900 14 were daily, 1 tri-weekly, 5 semi-weekly, 181 weekly, 1 tri-monthly, 11 semi-monthly, and 11 monthly.

Religion.—The Baptist Church claims over half the church population of the State, and then follows the Methodist Episcopal, South; African Methodist; Methodist Episcopal; Roman Catholic; Presbyterian, South; Cumberland Presbyterian; Disciples of Christ; and Protestant Episcopal. In 1900 there were 1,664 Evangelical Sunday-schools, with 11,967 officers and teachers, and 100,000 scholars.

Charities and Correction.—There is a State penitentiary at Jackson, where the prisoners are employed at farm labor. There are State hospitals for the insane at Jackson and Meridian. The State Deaf and Dumb Institute for white and colored, and the School for the Blind (white) are located at Jackson. There are hospitals supported by the State at Vicksburg and Natchez.

Manufactures.—There were 2,598 manufacturing establishments in Mississippi with an invested capital of \$72,393,000, in 1909. The gross value of products for 1909 was \$80,555,000. The value of materials purchased in a partly manufactured form was \$36,926,000. The salaries and wages paid were \$22,421,000, and miscellaneous expenses, \$9,360,000. These, with the cost of materials, deducted from the value of products leaves a net profit of \$11,848,000.

The following table shows the census figures for the leading industries for 1900:

Industries	Number of establishments	Capital	Wage Earners	Value of Products
Total for leading industries for State.....	3,205	\$20,210,084	20,072	\$31,372,442
Increase, 1890 to 1900.....	2,242	19,415,871	10,488	18,733,908
Per cent of increase.....	232.8	198.2	109.4	148.2
Per cent of total of all industries in State.....	67.2	81.6	76.0	77.6
Cars and general shop construction and repairs.....	9	741,753	1,534	1,326,401
Cotton ginning.....	1,901	3,553,853	8,422	2,214,949
Cotton goods.....	6	2,209,749	1,675	1,472,835
Flouring and grist mill products.....	225	225,335	208	932,816
Lumber and timber products.....	844	17,337,538	9,676	15,656,110
Lumber, planing mill products.....	34	631,553	748	1,315,775
Oil, cottonseed and cake.....	41	3,711,930	1,321	6,681,121
Turpentine and rosin.....	45	798,373	2,288	1,772,435

dren of school age numbered 598,609; the enrollment in public schools, 466,860; and the average daily attendance, 252,949. There were 9,446 teachers; 7,000 public school buildings and school property valued at \$2,000,000. The receipts for a year amount to \$1,500,000, and the expenditures to nearly as much. For higher education there were 113 public schools, 17 private secondary schools, 3 public and 2 private normal schools, 6 colleges and universities for men and 6 colleges for women. The men's colleges include Mississippi College, Clinton; Jefferson College, near Natchez; Rust University, Holly

Lumber and timber products form the leading industry, with cottonseed-oil and oil cake second. In 1900, Meridian had the mill of largest capacity, and Greenville the greatest number of establishments. Two establishments, one at Jackson and the other at Meridian, refined as well as expressed the oil. It is claimed that a Mississippian, John Ross, in 1801, made the first written suggestion that oil be expressed from the cottonseed and prophetically named its uses. The first mill in the United States was erected at Natchez, Miss., in 1834.

Cotton ginning has undergone a remarkable

MISSISSIPPI

development during the decade 1890 to 1900, and now holds third place among the manufacturing industries of the State. There were 3,022 establishments reported in 1910. In 1900 there were 2,422 wage-earners, and receipts for ginning were \$2,214,949. In 1890 there were only 130 establishments reported, with 547 wage-earners, and the receipts amounted to \$130,387. The increase in these receipts during the decade was \$2,084,562, or 1,598.7 per cent.

Transportation.—The total length of railroads within the State in 1907 was 3,760 miles, besides 92 miles of electric railway. The most important lines are the Gulf and Ship Island, the Illinois Central, the Yazoo & Mississippi Valley, the Southern, the Louisville & Nashville, the Kansas City, Memphis & Birmingham, the Mobile & Ohio, the Alabama & Vicksburg, and the New Orleans & Northeastern. Vicksburg, Greenville, and Natchez are principal ports on the Mississippi River, and Pascagoula and Biloxi on the Gulf of Mexico.

History.—Hernando de Soto (q.v.) and his companions first visited the Mississippi region in 1539. They made no settlements, however, and the death of the leader in 1542 put an end to the expedition. In 1682 La Salle descended the Mississippi, took formal possession of the adjacent country for the king of France, and called it Louisiana. In 1698 M. d'Iberville was authorized by the French king to colonize the regions of the lower Mississippi. He landed near Ship Island, and from this point, setting out with two large barges, explored the coast, discovered the mouth of the Mississippi, reaching the bend at the mouth of Red River, and returning to Ship Island erected a fort at the Bay of Biloxi, about 80 miles east from the site of New Orleans. He then embarked for France, leaving the fort in command of his two brothers, Sauvolle and Bienville. In December 1699 Iberville returned, and soon after built a fort on the banks of the Mississippi. In 1700 the Chevalier de Tonty arrived at Iberville's fort with a party of Canadian French from Illinois. Availing himself of De Tonty's knowledge of the country, Iberville despatched a party under his lead to explore the river and its banks. They ascended to the Natchez country, 400 miles above the French fort, and here selected a site for a fort, and called it Rosalie. A settlement was also made in 1703 on the Yazoo River, which was called Saint Peter's. The colonies thus planted grew but slowly, and New Orleans, being founded soon after, drew off a large portion of the colonists from the interior, besides attracting the new immigrants. In 1728 the settlers and the Natchez Indians became enemies, and as a result the latter massacred the settlement and over 200 persons were killed and 500 taken prisoners. The captives were, however, released, and new and stronger forts were erected. Aided by the Choctaw tribes, the French succeeded in destroying the tribe, the greater part of which fell in battle. In 1733 the colony went to war with the Chickasaws, allies of the English, and the conflict continued for several years. There was a peace, followed in 1752 by another Indian war.

In 1762 when Florida was ceded to Great Britain, that part of the present State lying south of a line drawn eastward from the mouth of the Yazoo River (practically from Vicks-

burg) was claimed to be part of Florida; and when in 1781, Spain conquered Florida, that part of the State came under Spanish rule. In 1798 the Mississippi Territory was created by Congress. Its boundaries were the Mississippi River on the west, the 31st parallel on the south, the Chattahoochee on the east, and a line drawn from the mouth of the Yazoo due east on the north. The Territory having been surrendered to the United States as part of Georgia, the consent of that State had been previously obtained to the establishment of a territorial government. This consent was followed in 1802 by the further cession by Georgia of all her lands south of Tennessee, and these by an act of Congress in 1804 were attached to the Mississippi Territory, which thus comprised the whole of what are now the States of Alabama and Mississippi from the 31st to the 35th parallel. The territory between the Pearl and the Perdido rivers was added in 1811, having been wrested from Spain under the plea that it had originally formed a part of Louisiana. In March 1817 Alabama was separated from Mississippi and organized under a territorial government of its own; and 10 December of the same year Mississippi was admitted into the Union as an independent State. In 1861 it passed an ordinance of secession, took a prominent part in the Civil War, and finally in January 1869 was readmitted to representation in Congress, after ratifying the 15th amendment. The principal battles fought here during the Civil War were those of Corinth, Baker's Creek, Holly Spring, Iuka and the siege of Vicksburg. Amendments to the State constitution were made in 1875 and 1877. The State has had four territorial governors, two provisional governors, one Union Democrat, three Republicans, and 28 Democratic governors.

EDWARD MAYES,

Author of Educational History of Mississippi.

Mississippi University of the State university chartered in 1844 and first opened in 1848, situated near Oxford. During the Civil War (1861-5) all exercises were suspended, and two members of the faculty appointed custodians of the University property. In 1872 the present organization in separate schools with optional studies was adopted, and courses leading to other degrees besides bachelor of arts were offered; in 1881 the law school was established. There are, therefore, now two departments: (1) The Department of Science, Literature and Arts; (2) The Department of Professional Education. The first includes 25 schools grouped into dis-

MISS. AGRICULTURAL COLLEGE—MISSISSIPPI LEVEE SYSTEM

tinct courses or lines of study, providing instruction in the languages, history, science, mathematics, political economy, philosophy, pedagogy and engineering; the degrees conferred are bachelor of arts, bachelor of science, bachelor of philosophy, bachelor of pedagogy, bachelor of mining engineering, bachelor of electrical engineering, and bachelor of civil engineering; there are also post-graduate courses in this department leading to the degrees of master of arts and doctor of philosophy. The second department included in 1903 only the law school. In 1900 the summer term of the University was begun. In 1882 women were admitted to all classes upon the same conditions as men, but were not allowed to lodge on the campus; in 1902 a special home for women students was erected. In the same year additional dormitories were built for men. The library has a special building of modern architecture, and in 1903 numbered 17,000 volumes; there is also a law library of about 2,000 volumes in the law building. Until 1880 the University was supported by annual appropriations of the legislature; since that time the income has been derived from the Federal grant of land, a second township being added to the original grant in 1894; the State has given occasional appropriations for buildings and improvements; in 1910 the income amounted to \$45,000. In that same year the students numbered 490, the faculty 46.

Mississippi Agricultural and Mechanical College, founded in 1880, at Agricultural College, Miss. The regular four years' courses offered are the agricultural, mechanical and textile, leading to the degree of B.S., a short course (10 weeks for two years) is given in the winter; graduate courses are also provided; and there is a preparatory department. Women are admitted to all courses. The experiment station is connected with the college, and receives special Federal appropriation; and farmers' institutes are organized by the college and attended by members of the faculty; in 1910 such institutes had an attendance of 2,000. The college was endowed by the Federal land grants of 1862 and 1890, and receives also State and Federal appropriations; no tuition is charged to residents of the State; the income in 1910 amounted to \$440,000. The number of students in 1910 was 942; the faculty numbered 60.

Mississippi Bubble, a celebrated financial scheme projected by John Law (q.v.) at Paris in 1717. Law issued shares for a vast company to be called the *Compagnie d'Occident*, and to be engaged in the colonization and cultivation of the banks of the Mississippi. Reports skilfully spread as to gold and silver mines discovered in these parts raised in the people the hope of great gains. The company soon absorbed those of the Senegal and the East Indies, and took the new title *Compagnie des Indes*. Such were the hopes raised by this undertaking that the shares originally issued at \$100 were sold at 10, 20, 30, and 40 times their value. Law had promised to the regent that he would extinguish the public debt. To keep his word he required that the shares in this company should be paid for one fourth in coin and three fourths in *billets d'état* or public securities, which rapidly rose in value on account of the foolish demand which was created for them. In October 1719 the shares mounted as high as \$4,000. The

state took advantage of the popular frenzy to issue increased quantities of paper money, which was readily accepted by the public creditors and invested in shares of the *Compagnie des Indes*. This went on till the value of the paper money in circulation was more than three milliards, while the value of coined money was no more than 700 millions. Before this stage was reached Law himself, who had originated the idea of paper money, had endeavored to check the issue, but his efforts were unavailing. A catastrophe was now inevitable. About the end of 1719 the more prudent speculators began to sell out. In payment of their shares they received, of course, in great part, *billets d'état*, and with these bought gold, silver, diamonds, lands, or anything else having a real value. As the *billets* became depreciated such articles as tallow, soap, etc., were often bought at fabulous prices. Law struggled desperately against the fall in the value of the shares, but all his devices to check their downward course were futile or had only a temporary success, and when the state finally declared that it would receive no further payments in paper, he perceived that all attempts to bolster up the scheme were in vain, and made his escape from France (December, 1720). The affairs of the company were wound up by the state acknowledging itself debtor to the creditors of the company to the amount of \$340,000,000. The public debt was augmented by \$2,600,000 of "annual rentes."

Mississippi College, in Clinton, Miss., founded in 1826 under the auspices of the Baptists. It has preparatory and collegiate departments. The college courses lead to the degrees of A.B., B.S., and Ph.D. In 1910 the school had 13 professors and instructors, and about 350 students. The library had about 4,000 volumes; the property was valued at \$45,000 exclusive of the productive fund of \$120,000. The annual income was about \$35,000.

Mississippi Levee System, The. The need of a system of levees along the margin of the Mississippi River, in addition to the bank revetment and contraction dikes which are used in the bed of the stream for the improvement of navigation, is that the banks are below the level usually reached by high water. But as they are higher than the land more remote from the river, their overflow results in the submergence of all the lands in the alluvial valley.

The scheme for outlets which has been urged from time to time is impracticable above Red River, where no suitable sites exist, and is to be condemned below Red River, where alone it is possible, notwithstanding the immediate but temporary relief which it might give, because both theory and experience show that when a reduction is made in the size of a river flowing in alluvial soil, or the river is split in two, the smaller rivers gradually take greater slopes than the main river had, and, as the slope begins at the level of the sea, all points in the water surface above will therefore be higher in the divided river than they would have been in a single channel. Hence the relief would be temporary, and, after the time required for adjustment, flood levels would be raised. This would surely occur unless, as is probable, the outlet closed itself by the deposit of sediment. Reservoirs to hold back the floods have been proposed on the Ohio, from which

MISSISSIPPI LEVEE SYSTEM

tributary the Mississippi receives the largest contribution to its flood waters, but examination proves them to be too costly and dangerous to be practicable. The opportunities for reservoirs on the upper Mississippi are too limited to have any important effect on the floods of the lower river. It is possible that the scheme of irrigation, on the scale now proposed by the Government on the rivers draining the arid lands may have the effect of abating floods below.

The use of the levee then has been in practice the sole method of restraining the waters of the Mississippi. It began in 1718 when the people of New Orleans built in front of the city a levee three feet high to keep the river back from a fertile alluvial strip. The work progressed slowly up the river during French and Spanish occupation, and even after the Louisiana Purchase in 1803. With the single exception of the grant from the Federal Government of certain swamp lands in 1850, all work on the Mississippi levees until 1882 was done entirely by the States, with no aid from the central government; and this aid, indeed, was purely nominal, as the swamp lands granted had no commercial value and could not be converted into funds to further the construction of levees, but needed the very improvement consequent on the building of levees to make them salable. By 1882, the year of the great Mississippi flood, it had become evident, on the purely physical side of the problem, that the control in the lower course of the river of the drainage from 1,250,000 square miles was too great a burden for the seven riparian States below the junction of the Ohio. In that year the first small allotment was made for levees by the Mississippi River Commission, from the appropriation of \$1,300,000, made by Congress for the improvement of the Mississippi River. As far back as 1845, a convention held in Memphis, Tenn., urged that "the improvement and preservation of those great rivers" (that is, Mississippi and Ohio) "are deemed impracticable by the States or individual enterprise, and call for the appropriation of money for the same by the General Government," a resolution passed with John C. Calhoun in the chair and by a body of representative State's Rights men, strict constructionists, and natural opponents of the doctrine of internal improvements. From 1882 in every River and Harbor Bill until 1896, from the appropriations for the improvement of the River, the Mississippi River Commission were allowed to make only such allotments for levees as they considered would benefit navigation. Since that year the bills have made specific provision for the building of levees. Between 1882 and the close of the fiscal year in 1903, the General Government's appropriations have amounted to a little more than \$18,000,000, by far the most of it granted since 1891. The States and levee districts up to 1903 spent more than \$40,000,000. This amount was raised by heavy State taxes. Thus, in Louisiana by special taxes in the alluvial counties on all real and personal property and products, and by a general tax of one mill on all property in the State, about \$2,000,000 is raised annually. This sum exceeds the average granted by the Federal Government for work throughout the whole valley each year. Besides this the State, by its Constitution, grants the free right of way for levees. It has also constructed and maintains

about 600 miles of levee on its interior streams without Federal or other assistance. Hence it will be seen that the States have borne much more than their share, and that the appeal for increased appropriations made to Congress by the Inter-State Mississippi River Improvement and Levee Association in 1903 at its convention in New Orleans is a reasonable one. The River Commission estimates that rather more than 94,000,000 cubic yards of levees will be necessary to complete the system; the estimated cost is not more than \$20,000,000, and the suggestion of this convention was that the appropriation of Congress be so increased that all this work can be completed in six or seven years.

The justice of such a claim is borne out by the success of the work already done. Any argument based upon this will be of greater force than the mere showing of facts signifies, since these results were attained with imperfect means, that is, with incomplete levees. The floods of 1897 and 1903 furnish a means of comparison. The 1903 flood was greater than that in 1897, but it broke levees only in six places, between Cairo and Red River, whereas the lesser flood of 1897 made 38 breaks. The earlier flood broke down over nine miles of levee; the latter only two and one half miles. The gain due to the levees constructed in these five years is apparent, and it seems logical to argue that upon the completion of the system crevasses will become at least as infrequent as shipwrecks, fires, or railway catastrophes. To some such conclusion the following figures point: the area overflowed in 1903 was 8,000 square miles out of a total of 29,000 square miles liable to overflow. Of these 8,000 miles, 3,000 was from back water through the openings left for the confluence of the tributaries. This may be reduced one third, but cannot be entirely prevented. About 2,000 square miles were overflowed from the present incomplete extension of levees and only 3,000 miles of inundation in 1903 resulted from the failure of the system as far as built. So that, throwing out the area (about 2,000 square miles) which could not be protected by a levee system, no matter how much it was perfected, it is evident that the present levees saved from inundation all but 3,000 square miles out of the 27,000 square miles which are the actual measure of efficiency of the present system. In brief, in its present incomplete condition the Mississippi levee system in a great flood has an efficiency of more than 85 per cent. In years of ordinary high water it approaches 100 per cent.

These figures, which were presented to the Mississippi Levee Convention in 1903, are the more remarkable from the fact that a part of the work has been in the hands of States and Levee Districts, the contracts having been placed by them and the work done after their designs, and that another part has been done by the Federal Government, with all the consequent opportunities for friction and for lack of harmonious plan. It is to be noted, however, that no such disagreements or incongruities as might have been expected have occurred—there having been, in fact, a remarkable concert of purpose and action between the officers of the United States Engineer Corps and the engineers of the local levee authorities who have had executive charge of the work. The designs and

MISSISSIPPI LEVEE SYSTEM

specifications prepared by them for levee work have been substantially the same, the controlling purpose having always been to build embankments as rapidly as means become available, at least two or three feet higher than any previous flood water, and of such width and section as experience has proved necessary for stability.

The levees built in the earlier period of construction were frequently low in grade and deficient in section; but, at least since the increase of means for the work due to the aid of the General Government, few levees have been designed or built with grades less than two feet above any previous flood level, or with a less width of base than seven times their height. The standard section approved by the Mississippi River Commission for levees not exceeding 12 feet in height, has a crown, or width on top, of 8 feet, with transverse slopes on both sides of 1 vertical on 3 horizontal. When above 12 feet high a "banquette," or additional base, on the landward side is to be added, extending from a point 8 feet below the grade, or level of the crown, with a slope of 1 on 10 for 20 feet and thence with a slope of 1 on 4 to the ground line; but in general cases this banquette is omitted until the whole line is built to a grade 3 feet above the highest known water. The ground on which the levee is to be built is cleared of perishable material and plowed or spaded, and trees or stumps are grubbed by the roots and one or more search ditches—usually called "muck ditches"—are dug along the line to discover and cut off roots or buried logs. In many of the ancient levees these precautions were either omitted or imperfectly carried out, and in some cases much trouble and danger have resulted from the decay of such material left under these older levees. The embankment is generally made with earth taken from pits on the side toward the river, 20 to 40 feet from the base. The work is nearly always done under contract, by the cubic yard, and formerly was almost entirely executed with spades and wheelbarrows, but now quite as generally with wheeled scrapers. A few levees have been built with power-driven machinery, and it appears probable that such tools and appliances will be more extensively used in the future.

At present there are 1,400 miles of levees reaching from near Cairo, Ill., to Port Jackson, La., nearly 80 miles below New Orleans. These are continuous, with the exception of gaps at the mouths of the Red, Yazoo, Arkansas, White and Saint Francis Rivers, to allow their junction with the main river. Through these gaps, in season of flood, the waters back up into the tributary basin, overflowing as much as 2,004 square miles now unprotected. The ultimate plan is to close all of them as nearly as possible.

The location of levee lines is necessarily governed to a large degree by the means available for building them. As the land is generally highest on the immediate banks of the river, levees located as close to them as possible are evidently smaller and less costly than those built further from the river on lower ground. But as the banks are more or less subject to erosion and caving in all concave bends, it becomes necessary to place the levees well back from such banks in order to give them permanency. The rate of recession in the past in any particular bend may indicate the probable position of the

river bank at a future date and thus determine the expectation of life for a given levee location. It has been a common practice of late years to locate them around caving bends, when time and means were available, so as to give them an expected life of not less than twenty years. But the rate of caving in any bend is extremely variable, and the locus of its maximum often still more so; and hence the life of a levee, as limited by the encroachment of caving river banks, is a matter of uncertainty, however carefully its lines may have been projected; for whenever they are reached by the caving of the river banks they, of course, fall into the stream with the ground upon which they stood. It is estimated that for the past eight years, the yardage annually required to close gaps thus occurring has been about one and a half per cent of the contents of the system as existing. With more ample funds for immediate use the margin between the caving banks and levee locations might, perhaps, be economically increased to give them a probable life much greater than 20 years around almost any bend. Indeed a large part of the line is so located as to appear beyond danger from caving banks for centuries; but sooner or later they must be threatened in many places, however located. The only remedy for this is the revetment of the river banks in such a manner as to prevent erosion and hold them in fixed position. This bank protection would often cost as much as \$150,000 per mile, where the average cost of a levee might not be more than \$30,000 per mile.

The contention that the confinement of flood waters to the path of the river induces deposits in its bed so that the channel becomes thereby filled and obstructed is not borne out by experience, nor by the innumerable soundings made for many years past by the Delta Survey and the Mississippi River Commission. Moreover, it is not consistent with the result of observation on smaller streams—Red River, for instance—where flood waters have been confined between levees, and the width and depth of the channel coincidentally increased, and the flood heights reduced. When the flood waters rise to the top of the natural banks of the river they may then overflow in a thin sheet without materially increasing the flood height in the river. But when this overflow is restrained by artificial banks, or levees, the water must rise higher. The extent of such rise, however, is not at all in like proportion to the volume of discharge. As the water rises the slope to the outfall increases, and also the larger channel occupied opposes a less ratio of frictional resistance to flow than the smaller channel. There is, therefore, a limit to the height of floods when confined between levees depending, when other conditions remain constant, upon their volume. There is reason to believe that the levee system of the Mississippi River as now designed, and under construction, will have a grade and height sufficient to restrain the largest flood volumes that can be expected to come down the river.

A strong attempt to make the question of increased Federal appropriations for the Mississippi levees a national issue naturally followed the passage of the Irrigation Bill, and was voiced in the Levee Convention held in New Orleans, 27-28 Oct. 1903. The Convention urged that the levee was the only solution of the diffi-

MISSISSIPPI RIVER

culty in the States on the lower Mississippi, no matter what a system of reservoirs and dams might accomplish on the upper courses of the river; argued that the protection and reclamation of land in the South was quite as clearly a case for governmental aid as the reclamation and improvement of arid lands in the West; and estimated that 20,000,000 acres of swamp land could be reclaimed by levee protection and made fit for the production of cotton, rice, cane and maize, at a total cost of \$3 per acre; that the levees could be maintained for less than ten cents per acre, and that the work was already two-thirds completed.

H. B. RICHARDSON,
Chief State Engineer of Louisiana.

B. M. HARRIS,
Member Mississippi River Commission.

Mississippi River (Ind. *Missi Sepe*, "father of waters," "great river"), the main stem of the greatest drainage system of North America, and one of the greatest in the world (1,257,000 square miles); draining the entire western slope of the Alleghany-Appalachian range, and all the eastern slope of the United States Rockies save a small southern portion, with all between—10 States and 2 Territories in all, from New York to Montana, but narrowing considerably in the lower basin. The Mississippi extends nearly the entire length of the United States, from within 100 miles of Canada to the Gulf of Mexico, in a water course of about 2,550 miles, varied slightly by the lower river's bends and cut-offs; and forms the boundary, total or partial, of 10 States—Minnesota, Iowa, Missouri, Arkansas, and Louisiana, on the west, and Wisconsin, Illinois, Kentucky, Tennessee and Mississippi, on the east. It has on its banks four cities with from 200,000 to 600,000 inhabitants (Saint Louis, New Orleans, Saint Paul, and Minneapolis), and 17 others of over 10,000—Winona, Minn.; La Crosse, Wis.; Dubuque, Clinton, Davenport, Muscatine, Burlington, and Keokuk, Ia.; Rock Island, Quincy, Alton, and Cairo, Ill.; Hannibal, Mo.; Memphis, Tenn.; Vicksburg and Natchez, Miss.; and Baton Rouge, La. It is navigable precisely 2,000 miles (at present) from its mouth to Minneapolis (Falls of St. Anthony), though the end of regular navigation is St. Paul, 13 miles below; and is brokenly navigated by smaller steamers to Leech River, 415 miles farther on, along different reaches. It has about 100,000 tributaries, 240 large enough to figure on small-sized statistical charts, 45 of them navigable for distances varying from 2,300 to 50 miles, and aggregating some 15,700 miles of inland navigation; steamers can go upon it and its tributaries some 4,000 miles east and west without breaking bulk—from Great Falls, Mont., on the Missouri, to Olean, N. Y., on the Allegheny. The greatest of the affluents, the Missouri, is usually considered the main stream, being about 1,600 miles longer than the 'upper Mississippi above the mouth (4,200 miles from the Gulf, the longest river course on the globe), having a basin more than three times as great, and discharging a considerably larger volume of water annually; nevertheless the upper Mississippi has so much steadier a flow—the Missouri shrinking at low water to 1-48 the volume in flood, and practically unnavigable then—that the former as between the two maintains the permanent navigability

of the joint stream, and is justly enough held the main body in popular estimation, besides that the axial valley is continuous. Moreover, the Ohio with its great rainfall (41.5 inches, against 35.2 for the upper Mississippi and 20.9 for the Missouri) discharges far more than either, and if that were valid ground, should itself be held the main stream.

The chief tributaries of the lower Mississippi are as follows, in order of contribution to the volume of water in the lower river: Ohio, 1,300 miles long (to source of Allegheny); width, 1,200 feet at Pittsburg, 3,000 at mouth; basin, 207,111 square miles; annual discharge, about 5,000,000,000 cubic feet; per second, 158,000. Missouri, 2,908 miles long; width, 1,500 feet at Fort Benton (head of large-steamer navigation), 3,000 at mouth; basin, 527,690 square miles; annual discharge, 3,780,000,000 cubic feet; per second, 120,000. Upper Mississippi, 1,330 miles long; width, 1,200 feet at St. Paul (head of large navigation), 5,000 at junction with the Missouri; basin, 179,635 square miles; annual discharge, 3,300,000,000 cubic feet; per second, 105,000. Arkansas, 1,514 miles long; width, 1,500 feet at Fort Smith (head of large navigation), and about the same to its mouth; basin, 184,742 square miles; annual discharge, 2,000,000,000 cubic feet; per second, 63,000. Red, 1,200 miles long; width, widely varying from log dams, etc.; annual discharge, 1,800,000,000 cubic feet; per second, 57,000. The three next greatest basins are the White, Yazoo, and St. Francis. The total annual discharge, including three outlet bayous, is 21,300,000,000 cubic feet, or 675,000 per second.

The following are the distances from the farthest sources on the main stem to the chief landmarks on its course, and the mean-water elevations above sea-level at the end of the reaches:

	Dist., Miles	Elev., Feet
Mississippi Springs, above Itasca, and 6 1/4 miles from outlet.....		1535
Outlet at Itasca to outlet at Winnipegosis Lake	114	1292.2
To Falls of St. Anthony (Minneapolis)	546	782
To St. Paul, Minn.	559	680.5
To La Crosse, Wis.	715	621.2
To Prairie du Chien, Wis.	787	597.5
To Dubuque, Ia.	840	578.5
To Rock Island, Ill.	957	533.7
To Burlington, Ia.	1,022	505.1
To Keokuk, Ia.	1,085	472.3
To Quincy Bridge, Ill.	1,127	453.8
To Hannibal, Mo.	1,147	444.9
To mouth of Illinois River	1,248	399.4
To St. Louis, Mo.	1,288	364.2
To mouth of Ohio River (Cairo, Ill.)	1,470	275
To Memphis, Tenn.	1,605	201
To Natchez, Miss.	2,177	40.5
To Baton Rouge, La.	2,310	18.5
To New Orleans, La.	2,435	8
To Fort St. Philip, La.	2,509	3
To head of Passes	2,529	1.8
To Gulf	2,546	
(Or 2,553 miles from ultimate sources.)		

The "source" of a great river is often a term of little import, as its waters may gather from the drainage of a large district; but taking it in its current sense, of the ultimate reservoir of its farthest extension, the Mississippi rises in the basin draining into Itasca Lake (q.v.) in northern Minnesota. Into the west arm flows

MISSISSIPPI RIVER

from the heights, through a couple of small ponds, a stream of considerable power and fullness, called by its discoverer Nicollet the "Infant Mississippi," and now confirmed as such so far as there is one ultimate stream; and out of it, from the north arm, flows the Mississippi. Nicollet in 1836 found it 16 feet wide and 14 inches deep at the outlet. Government Commissioner J. V. Brower in 1893 found it 50 feet wide and 3 or 4 deep in mid-channel, with a muddy bottom, and a current of about two miles an hour. As the current increases, it narrows to some 30 feet; is filled with debris, shoals, and boulders; and for some distance down the stream, free passage with canoes is impeded by reeds, flag, and water grass. It continues northward with slight falls and rapids, to Lac Travers or Bemidji, about 10 miles long by 4 wide, set in a basin surrounded by forested hills and with a beach of perfectly white sand. Thence it issues on the east, and for 25 miles southeastwardly brawls over a series of rapids, from whose foot it flows in a clear even stream 120 feet wide and 4 or 5 deep to Cass Lake, twice as large as Bemidji; thence on the east six miles to Winnibigashish, still larger, whence it issues again on the east 172 feet wide, and as before grows narrower, deeper, and of swifter current as it drains the marshes and meadows below. Just above the junction with Leech River, the outlet of the noble Leech Lake, the largest in this region,—25 by 15 miles,—it strikes a bed of sandstone with a fall of 20 feet in one sixth of a mile, and is ruffled into rapids called the Falls of Pokegama, in a channel 80 feet wide. This is about 130 miles from the source; small steamers run to the foot of the rapids. Thence it runs crookedly with a general south trend, about 120 feet wide, through hardwood forests, swamps, and sand-hills, covered with glacial gravel and boulder drift. From the entrance of Swan River to that of the outlet of Sandy Lake there are six rapids; the latter lake has a small stream running from a small pond to the eastward, not far from Saint Louis River, emptying into Lake Superior at Duluth, and forms the old canoe route from Minnesota to the Great Lakes. Thence to the entrance of Pine River, about 150 miles from the Pokegama Falls, it has numerous rapids, and is broad enough to enclose several islands; it receives several smaller tributaries; and the powerful Crow Wing River, 47 miles below Pine River, also fed from a district of lakes, contributes almost as much volume to the joint stream as the Mississippi itself. At the Sauk Rapids, a mile long, 133 miles below the Crow Wing, and at the entrance of Sauk River, begin the first rocky banks, of Potsdam sandstone, extending down to Rock Island.

At the Falls of Saint Anthony, 80 miles below, the river descends about 65 feet in three fourths of a mile, forming rapids interrupted in the middle by a precipice 18 feet high; over which the river, now 1,200 feet wide, formerly plunged in a cataract of great beauty and fame. An island divided it into two channels, the western being the larger. Here the water-power has been used to build up the immense manufacturing interests of Minneapolis, and the falls are no more, as will perhaps be the fate of Niagara. Thirteen miles below, a convenient landing has established Saint Paul as the head of continuous navigation for large steamers, and

made it the great wholesale distributing point for the Northwest, and onward the valley is richly fertile, very beautiful, and often of much grandeur. Below Saint Paul the river widens into the island-studded "Lake" Pepin. From Davenport, Ia., 943 miles from the source, to Rock Island, 14 miles below, there are rapids of 22 feet fall, formerly obstructing the navigation; the government has now cut a channel in the solid rock. The formation of the bed is peculiar, it consists of stratified limestone, crushed into folds which form a series of six or seven parallel bars across the channel, one to three miles apart. From this point onward, the formation is Carboniferous, and the banks rise into picturesque rocky bluffs sometimes 300 feet high, as far down as nearly to the beginning of the alluvial region, 140 miles below Saint Louis. At the mouth of the Des Moines River, 130 miles below Rock Island, is another rapid of 24 feet fall, now avoided by a ship canal; and between Muscatine and Keokuk is one 12 miles long, with 23 feet descent. Nearly 200 miles below Keokuk the first great change comes to the river. Into this clear placid stream is poured a swift muddy red torrent, at high water of far greater volume than its own, that of the enormous Missouri, creating turbulent eddies, and for many miles flowing side by side with the white northern stream without mixing of waters. The bends and winds of the river, making the current cross from side to side, finally mingling them within 100 or 150 miles. Not quite 200 miles farther on, comes in the mighty Ohio, with a volume over two thirds as great as that of the other two united.

But 30 miles above here, and three miles above the great geological landmark of Cape Girardeau, Mo., begins a still greater change: the vast northern upland, mainly elevated rock with a moderate soil covering it, which has been drained by the river, ceases. The remaining 1,100 miles of its valley is the creation of its own silt; through which it meanders in deep curves and loops and narrow horseshoes, shifting its channel capriciously, continually building up one side and cutting away the other, but rarely twice the same side. Cape Girardeau is an ancient headland of an ancient ocean, into which the silt-laden river poured its deposits as the present river does into the Gulf, and which has receded, leaving more than 1,000 miles of the garden of the world. And the relation of the river to its bottoms is reversed also. From the Falls of Saint Anthony to the end of the uplands, are deep strips of bottom land overflowed at high water; but except at such periods they are above the river. But in the lower bottoms made by the river itself, the surface of the latter is normally *above* that of the bordering lands. The friction of the current on the sides and bottom causes the water held back to keep depositing fresh layers of the heavier sediment on the edges and in the channel; so that as the depth of water remains the same, and the channel continually shallows, the surface of the water must rise, and would at last empty itself did not the same process elevate its retaining walls. The river therefore runs in a groove, cut into a ridge considerably above the surrounding country, its surface much higher and its bed much lower than the region for many miles back: it slopes away with a gradient at first of about seven feet to the mile, de-

MISSISSIPPI RIVER

creasing regularly to the outer edges of the flood plain—which at the Ohio is about 10 miles wide, and 50 to 70 in lower Louisiana, widening to 150 at the Delta—and ending at about six inches per mile in the swamps and bayous at the outer edge. The natural method of discharging the waters at flood seasons is to spill over the banks and flood the adjacent country, part of the waters flowing off through semi-river channels (bayous) in the soft earth, the rest remaining in pools and swamps and gradually evaporating; and the attempt to keep it in the same channel which suffices for low water, to comport with the needs of civilized occupancy, has produced an excessively costly battle with nature, of which the success is by no means yet assured or assurable.

The junction of the Red introduces us to still another phenomenon. That great river formerly discharged its main waters to the Gulf through the Atchafalaya "Bayou," roughly parallel with the Mississippi; but that and the Mississippi both sent their surplus waters through an amazing network of lesser bayous, which still penetrate southern Louisiana with thousands of miles of navigable channels. The head of the Atchafalaya silted up and became choked with logs and rubbish, and the Red opened a channel into the Mississippi; late in the 19th century the government dredged out the head of the bayou to make a navigable channel; it rapidly widened to a great river, became again the main channel of the Red, and threatened to ruin a great district of fertile plantations; so that works had to be undertaken to prevent its enlargement. As we approach the place where the Mississippi plain merges in the great coastal plain of the Atlantic, the surface grows lower and the soil spongy; and the river (which above the Missouri is about a mile wide, thence to the Red half a mile to a mile, with occasional reaches of a mile and a half, and below the Red narrows to a width of about 3,000 feet, which it retains with curious persistence) widens to about a mile and a half and enters the Gulf—through the Delta, a quaking, impassable, finally half liquid salt marsh, land in process of making—by three great arms or "passes," of which two ramify still further. These are known as the Southwest Pass, the South Pass (with two arms near the Gulf) and an eastern arm soon dividing into North Pass and Pass à l'Ouvre.

It should be said, however, that these alluvial bottoms do not quite monopolize the space from the Ohio to the Gulf. Here and there on the east bank there are spots where high solid ground, old capes and peninsulas of the antique ocean, comes down to the river side; as at Columbus, Ky., Randolph and Memphis, Tenn., Vicksburg, Grand Gulf, and Natchez, Miss., and Baton Rouge, La. With one exception, each of these spots has been utilized as a considerable road for the commerce of the interior to the great waterway.

Improvements of the River.—These are broadly divisible into two classes: those designed to improve navigation, and those designed to prevent overflows. The one, therefore, has for immediate object the deepening or equalizing of the permanent channel, the other the raising and strengthening of the banks. To some extent both require common methods, as in stopping off overflow channels; often they are antagonistic, navigation being improved by narrowing

the channel, liability to breakage of banks decreased by widening it. The methods of the second have been more used to achieve the first than some engineers think judicious.

At high water the navigation problem presents no difficulty; work should therefore be concentrated on low-water conditions. It must be said that so far, all the notable good, except in case of the jetties at the mouth, has been accomplished by the old-fashioned methods of blasting and dredging; aided by superior modern appliances; and even the jetties would fail of their work without constant dredging. It is obvious that as no more water in total can be furnished to the river, there are but three possible methods of obtaining more at a given spot and time: first, to pond a portion of the flood waters in reservoirs, sluicing it out at low water; second, to concentrate the water where it is needed; third, to level the bed of the stream so that there shall be no undesired ponding behind shoals and bars, and no rock projections. The first has been given up as entirely impracticable: no conceivable artificial reservoir can supply enough water to keep a great river full. The second has two methods. One has been applied with excellent success, not to the main river but to the Ohio, where six locks and movable dams, each costing \$800,000, creating pools from place to place, have given six feet of water for some distance below Pittsburg; and 12 more are in contemplation, to extend the system to Marietta. This is the canal system, and a rational one: it may yet be applied to the great river. The improvement of the Missouri in like manner has been discussed; but the excessive lowness of the water in the dry season—but 15,000 cubic feet per second—with the enormous amount of sediment brought down at high water, 1-39th its weight against an average of 1-265th, make it almost hopeless. Another and older method, also excellent, is to narrow the channel and so deepen the available water. As it would not be practicable to build thousands of miles of artificial river channel, effort must be directed to improving the natural one. To this end, it is narrowed by closing off side channels around islands, etc.—stopping up the heads; diking off small bays and inlets; strengthening caving banks; and obstructing the side current by solid spur dikes, set obliquely out into the stream nearly to the channel line. After the entrance of the Missouri, the mass of sediment furnishes a new and effective weapon. Between here and Cairo hurdles of piles and brush are laid along the banks, jetty fashion; the sediment packs into the brush and speedily becomes solid, and the results in creating new banks to narrow the channel have been most gratifying, besides reclaiming large tracts of overflowed bottom lands. Caving banks are protected by mattresses (see JETTIES for their construction); the depth of water being slight, they can be made lighter than in the lower river. Below Cairo the work is of the same nature, but more difficult from the volume of water and the alluvial lands easily crumbling. Here the channel is sought to be narrowed, where it exceeds about 3,500 feet, by mattresses from 800 to 2,000 feet long, and 200 to 300 feet wide, weighted down with rubble stone. But the immense weight of the water, which may be from 60 to 100 feet deep at flood, has forced their continual increase in weight and strength of construction.

MISSISSIPPI RIVER PROBLEM

The brush and small saplings have been replaced by fascines (solid rods tightly withed together), the binding poles by strong wire; the cost per foot of bank protection has trebled in the last 25 years, rising from about \$10 to \$30. For closing off side channels and water-courses, rows of piles are driven in, 8 or 10 feet apart and the rows 20, and the upper row interwoven with brush. Caving banks are graded down to a slope, and faced with mattresses; of late, however, rubble stone has been used with better success. On the lower river, where stone has to be brought from long distances, concrete has been experimented with.

Another system, however, has been tried for many years at enormous cost, and is still an experiment—that of levees. (See *MISSISSIPPI LEVEE SYSTEM*.) Formerly, under the slave system, each planter along the rivers liable to overflow had rude dikes erected for himself; the importance of the work to neighborhoods led to common town action, then to county and State action. These levee systems, of course, were broken through in floods, but the water rose only to its natural height in the channel, and soon subsided; and to furnish absolute security against overflow would cost not only an enormous sum, but would exceed a hundred-fold the capital value of the districts imperiled. When in 1879 Congress appointed the Mississippi River Commission, it forbade them to consider the protection of lands from overflow as part of their work. Nevertheless, a majority of the Commission believed that the levee system could be used efficiently to improve navigation; and estimated that \$11,443,000 below Cairo would furnish a complete protection for the banks and double the depth of permanent river channel, by the natural scour of the water as with jetties. Since then, the National government and the States (about half each) have spent over \$28,000,000, and it is estimated that \$22,000,000 more will be needed to complete the work; the channel has not been improved at low water, except by means not connected with the jetty system; and the level of the river has risen with the levees, over six feet already, and estimated to ultimately reach 11 when the levee system has made a smooth solid bank all the way, with no places for overspill. These levees are from 8 to 14 feet high, with a width on top of 8 feet, and a side slope of $\frac{1}{2}$; and are intended to project three feet above high water, but need to be raised every few years as the river rises. There are now about 1,400 miles of continuous levees from New Madrid, Mo., 80 miles below Cairo, except for some 50 miles around Memphis, where there are gaps; and it is estimated that half of this will have to be made 14 feet high eventually. They have to be placed near the banks, to protect riverside plantations and avoid the slope away from the river; and very large amounts of them have to be replaced yearly from cave-ins.

The leveling of the channel bed has perhaps done more for navigation than all the others, except the movable dams. The blasting of a channel through the solid rock bed at the rapids between Davenport and Rock Island, and the cutting of a canal at the Des Moines Rapids, are permanent improvements. In the sand bed below the junction of the Missouri, the best work is steadily done by the pumping dredges, of which there are two between there and Cairo,

and nine in the lower river; most of these have a capacity of 1,000 cubic yards of sand per hour, which they suck in through long pipes. They cost on an average \$100,000 apiece, and \$20,000 a low-water season to operate. Their work can never be done, for the river constantly creates new tasks for them, by the same natural law that created the first one, and creates them in ever new places; but the hope of navigation rests on them. They attack a sand-bar when the water is falling, and cut a channel about 2,000 feet long and 250 feet wide, to a depth of three or four feet.

From St. Paul to the Missouri River, where at low water there is sometimes only two feet in the upper reaches, and 3 in the lower, there are good hopes of maintaining $4\frac{1}{2}$ feet; and 6 to Cairo, with an ultimate hope of 8, where now there is $3\frac{1}{2}$ or 4; 10 to Memphis, and 12 below for some distance. At New Orleans the water is deep enough for the largest ocean steamers; and in consequence of the jetties, vessels of 30 feet draft can now ply to foreign ports. See *JETTIES*.

Mississippi River Problem. The control of the waters of the Mississippi so as to make the navigation of the river safe and so as to make the immediately surrounding country fit for agriculture is a great economic problem of more than merely local interest. The problem is national historically, for to the control of the Mississippi as much as to any other one thing the historical growth of the country is due. It is even more strikingly true that the problem is of national significance from the commercial point of view, simply because this vast river drains the richest territory in the world, 70 per cent of the area of the United States. The additional importance of the Mississippi as an artery of commerce after the digging of the Isthmian canal is evident, inasmuch as New Orleans will then be a port for Pacific trade. This city commanding a new commerce the regulation of the waters of the Mississippi will benefit very greatly, first, by making the river more thoroughly navigable, and second, by protecting the adjacent country, so that these rich lands can be utilized for the growth of cotton, rice, and cane, and that, at the same time, the railroads now being built between St. Louis and other western points by the 'Frisco road and by the Gould interests will be protected from overflows. In short perfect regulation of the waters of the Mississippi would mean to New Orleans safer communication by land and by water with the country for which the city ships abroad and larger crops to handle from the improved and reclaimed bottoms. The national importance of the control of the river and its safe navigation was outlined in the early 50's by Matthew F. Maury, who picturesquely phrased the almost universal commercial character of the territory it drained to the north and of that which it commanded at the south. Referring to an Isthmian canal, Maury said:—"And when there shall be established a commercial thoroughfare across the Isthmus the trade winds of the Pacific will place China, India and all the islands of that

MISSISSIPPI RIVER PROBLEM

ocean down hill also from this sea of ours. In that case the whole of Europe must pass by our very doors on the great highway to the markets both of the East and West Indies." He also stressed the great future agricultural value of the drowned lands in the Mississippi Valley ceded by the Federal Government to the States; and noted particularly that this access of new fertile soil to the tillable area of the South would particularly affect American supremacy in the cotton market of the world. If this was true in 1850 it is much more true now, for the increased natural wealth of the country lies very largely in the basin drained by the Mississippi; New England, New Jersey, Delaware, South Carolina, Florida, Arizona, Utah, Idaho, California, Nevada, Oregon and Washington are the only States that do not or will not depend for their prosperity on the prosperity of the States actually touching the Mississippi. That this preponderance of importance is not a mere matter of abstract physical geography may be seen from the following table showing the proportion of various interests in the Mississippi area as compared to the whole country:

	Total in United States	Total in the Mississippi area	Percentage of total in the Mississippi area
Population	75,994,578	62,166,099	82
Area, square miles.....	2,970,230	2,107,550	70
Improved acreage.....	414,498,487	374,313,897	90
Timber acreage.....	38,222,937	23,748,801	73
Railroad mileage.....	194,121	162,506	83
Farm products, value.....	\$4,717,069,973	\$4,154,233,789	88
Manufactures, value.....	\$13,010,036,514	\$9,850,075,296	75
Wheat, bushels.....	658,534,853	571,701,154	85
Corn, bushels.....	2,666,324,370	2,617,409,198	98
Cotton, bales.....	9,534,707	8,591,391	90
Tobacco, pounds.....	888,112,865	823,247,901	94
Hay, forage, tons.....	84,010,815	71,152,786	84
Coal, tons.....	269,881,827	266,150,899	98
Iron ore, tons.....	27,553,161	27,177,729	98
Spelter, tons.....	123,886	115,627	94
Lead, tons.....	230,090	139,835	60
Petroleum, barrels.....	63,362,704	59,263,220	93

The showing of this table of present statistics puts the national significance of the Mississippi problem beyond cavil, and it is to be borne in mind that the future, too, should be consulted. As the law that industries sooner or later get as near as possible to the source of raw material is carried out in America, this Mississippi area will inevitably grow faster than any other part of the country. If this entire section had, as it well may have 50 years hence, a mileage as great per square mile of territory as the present State of Ohio, it would possess 458,163 miles, that is more than twice the present mileage of the whole country. A proportional increase in agriculture and manufactures in the Mississippi area would mean annually 700,000,000 bushels of wheat, 8,000,000,000 bushels of corn, a total annual value of \$12,500,000,000 in agricultural products, and of \$40,000,000,000 in manufactures. The accomplished fact of the last two decades makes such prophecies possible. And the table given above cannot be gainsaid, no matter what the doubter may think of the forecast just outlined. The table certainly shows that what affects the Mississippi area is a matter of national importance, or to be more concrete that the Federal Government should bear the expense of improved navigation on the Mississippi, of protection against flood for the new railroads required

by New Orleans' increased shipping in the near future, of protection of farms and plantations along the river course, and of the reclamation of swampy lands adjacent to the river. This is certainly a great and an expensive work, but it would be a break with past tradition and precedent to refuse large appropriations for internal, commercial and industrial defense and offense, or to make the solution of this problem secondary to an increased army or navy list, for example; for the place in world politics taken by the United States is due primarily to agricultural and industrial supremacy. Looking at the question from this side it becomes evident that Mississippi River appropriations are of far too great importance to be merely a part of the Rivers and Harbors Bill; that these appropriations have been placed there is due to the unfortunate fact that the improvement of the navigation of the Mississippi has been treated as the sole item in the great Mississippi problem. As a matter of fact it is primarily and immediately no less important than the protection of riparian lands; and to make it the only end of appropriations, as was done with scarce an ex-

ception up to 1891, and very largely since, is to forget the value of the swamp lands with their rich alluvial deposits, which should be reclaimed, and also the new factor in the problem, namely, the demands of the railroads for protection. In comparison with the widespread significance of the Mississippi area, the arid lands of the West which are to be reclaimed by a national scheme of irrigation are small and unimportant. Sooner or later the bigger and more national problem will be settled in a national way. The remedies suggested are various. The levee (see *MISSISSIPPI LEVEE SYSTEM*) when perfected should protect the railroads and the plantations along the river, besides contributing something to the reclamation of long flooded land. But the levee does not go to the root of the matter. It may not be easier, but the result would be safer, if such terrible floods could be prevented, or partly checked. To accomplish this, or to lessen the volume of water in the lower course of the river, by striking at its upper waters seems theoretically and logically correct, but the practical means are unknown. No doubt the reforesting of the country adjacent to the head-waters of the Mississippi and its tributaries would partly accomplish this, but whether such reforesting itself could be accomplished is a question. Certainly

MISSISSIPPI SCHEME—MISSOULA

this is not a speedy, though it may prove the ultimate solution; just as surely such a remedy cannot be applied save by the General Government. The apparent success of the Assouan dam in Egypt as a method of controlling floods and furnishing irrigation supply suggests that a great system of dams and reservoirs might assist in protecting and enriching the soil of the immediate Mississippi Valley. None of these schemes seems to promise any great improvement in the navigability of the Mississippi, which the levees have not greatly bettered, although many of them were constructed by government orders primarily for this purpose and not for protection. RICHARD H. EDMONDS, Editor *'Manufacturers' Record.'*

Mississippi Scheme. See **MISSISSIPPI RIVER.**

Mississippi Sound, an arm of the Gulf of Mexico, extending along the coasts of Mississippi and Alabama from Bay Saint Louis on the east to Mobile Bay on the west and connecting with the latter by Grant's Pass. It is about 100 miles long, from 7 to 15 miles wide, and is formed by a chain of low, narrow, sandy islands, chief of which are Dauphine, Petit Bois, Horn, Ship and Cat.

Mississippian Series, in geology, a group belonging to the sub-carboniferous period and consisting of shales and sandstone beginning in southwestern Illinois, where they are 1,200 to 1,500 feet thick, running south through Indiana, Kentucky and Texas, and divisible into: the Kinderhook group, which includes the Louisiana limestone and the Knobstone sandstones and shales; the Osage group, comprising the various Burlington groups; the Saint Louis group, with thick limestone beds; and the Kaskaskia or Chester group, mostly limestone with shale and sandstone intercalated.

Missolonghi, mī-sō-lōng'gē, or **Messolongi**, mā-sō-lōng'gē, Greece, a northwestern town, capital of the nomarchy of Acarnania and Ætolia, on the marshy site on the north side of the Gulf of Patras, 24 miles west of Lepanto. It stands on the edge of a lagoon, across which a causeway two miles long leads to the town. The surrounding level plain, 18 miles long and 4 miles broad, is watered by the Achelous and Evenus, and extends from the base of Mount Aracynthus to the gulf. Missolonghi is the most important strategical point of western Greece and is famous for the sieges it has undergone. In 1804 it came under the rule of Ali Pasha. In the Greek revolt against the Turkish conquerors in 1821, Mavrocordato and Marco Bozzaris, with 400 men, 14 old guns and scanty ammunition, brilliantly defended the place against a Turkish army of 14,000 for two months; when reinforced, they again for over a year resisted the Turks, who raised the siege 6 Jan. 1823. The town was hastily fortified, and from September to December 1823 was again besieged by the Turks, who were defeated by a small Greek force under Marcos Bozzaris (q.v.), but with the loss of their patriotic general. In 1825-6 it stood a long siege by the Turks, latterly commanded by Ibrahim Pasha. A body of its defenders cut their way through the Turkish force and escaped; the remainder determined to sell their lives as dearly as possible, and

when the Turks forced their way in, the powder magazine was exploded, thus overwhelming besiegers and besieged in one common catastrophe. Lord Byron, who went to Missolonghi 5 Jan. 1824 to aid the Greeks, died there 19 April 1824; his heart was interred in the church of St. Spyridion, and a monument was erected by the Greeks in his honor. Here also is the tomb of Bozzaris. Pop. (1896) 8,394.

Misson, Francis Maximilian, French traveler and author: b. Lyon about 1650; d. London, England, 23 Jan. 1722. He was a councillor in the parliament of Paris, but at the revocation of the Edict of Nantes, as a Protestant, fled to England. There, in 1685, he became tutor to Charles Butler, earl of Arran, whom he accompanied in his travels. In 1691 he published *'Voyage d'Italie,'* in which his comments on the customs of the Roman Catholic Church led to a celebrated controversy with Father Freschot. In 1698 he published a volume of *'Mémoires et Observations,'* which constitutes a humorous descriptive dictionary of London life in Queen Anne's reign. His other chief work is *'Théâtre Sacré des Cévennes'* (1707).

Missoula, mī-zoo-lā, Montana, city, county-seat of Missoula County; situated on both sides of the Hell Gate River, a tributary of the Columbia River, and on the Northern Pacific Railway, in a beautiful and fertile valley, called by the early settlers Hell Gate Ronde. The city has an elevation of 3,201 feet above sea level, and is situated in 46° and 52' north latitude, and in longitude 113° and 50' west. The climate is salubrious, the winters being mild, and the summer and fall delightful. The average annual rainfall is about 16 inches. The city was founded in 1864, the first house, a log cabin, being built that year. The pioneer merchants of Missoula were Worden & Co., who built, in 1865, grist and saw mills, and erected and opened a store. The place at that time was called Missoula Mills, which name it retained for several years, when it was changed to Missoula. It was incorporated 1883. It was the first city in Montana to have commission government. It is situated in the centre of a fine agricultural, fruit and lumbering region, and a large mining region is tributary thereto. Missoula is the seat of the State University of Montana, which was opened in 1895. There are two hospitals in the city, one of them maintained by the Northern Pacific Railway and its employees, in which the employees of the company are treated; the other one is owned and maintained by the Sisters of Charity of the Catholic Church and called Saint Patrick's Hospital, and is one of the largest and best appointed and conducted hospitals in the West. The same Sisters of Charity have a very large academy called the Sacred Heart. A commercial college is also located here, and the city has a splendid system of public schools. The new library building just erected is well supplied with a public library. There are many wholesale and retail stores, and a large mercantile business is done in supplying the local trade, and also in supplying the various mining and lumbering regions tributary to the city. There are two large manufacturing establishments engaged in the manufacture of doors, sash, blinds, dressed lum-

MISSOURI

ber, and other building materials; also one brewery, one flouring mill, bottling works, and other manufacturing establishments. The city supports two national and one private bank, it also has 10 churches of different denominations, and a large number of lodges of fraternal organizations, and sustains a Business Men's Club. Fort Missoula, a United States Military Post, 4 miles west of the city, is garrisoned by four companies of infantry troops. The city is the trade centre for a large section of country, and ships large quantities of grain, fruit, hay, livestock, wool and lumber.

The Flathead Indian Reservation, which by an act of the last session of Congress was directed to be surveyed and opened for settlement, lies about 15 miles north of the city, and contains approximately 1,750,000 acres of fine agricultural, grazing and timber lands. This body of land is now being surveyed by the United States government, preparatory to being thrown open to settlement, all of which will be tributary to the city. Missoula is situated in the heart of the country formerly occupied by the Flathead tribe of Indians which was ceded to the United States by a treaty made in 1855, known as the Stevens treaty. Missoula is a Flathead Indian name or word, meaning or signifying "At the stream or water of surprise or ambush." In the olden days prior to the advent of white men amongst the Indians of this section, the Blackfeet, who were very numerous, and occupied the country on the waters of the upper Missouri, and the Flatheads, who occupied the country in the vicinity of Missoula, were hereditary enemies and engaged in a continuous warfare one against the other. The place where the city of Missoula is now located, being at the western foot of the mountains, and near the mouth of a long and deep cañon, with a beautiful stream of water near by, was a favorite camping place for the Flatheads with their lodges and families. The Blackfeet having a knowledge of this fact, would often take advantage of it, and when on the warpath would secrete themselves in the willows and rocks, and from this ambush attack their unsuspecting enemies, hence the name, "at the stream or water of surprise or ambush."

Missoula is known throughout the State as the "Garden City," because of its magnificent gardens and the abundance of flowers grown here. The city is supplied with an abundance of electricity generated at its power plant on the Big Blackfoot River, and transmitted by cable a distance of 7 miles. It also has an abundance of water of the best quality, supplied by a water company from a never-failing stream coming direct from the snow-clad mountains to the northeast of the city. Another water company is engaged in bringing into the city from the Big Blackfoot River, a distance of 10 miles, 800 cubic feet flow of water per second, to be used to supply the future wants of the inhabitants, and to be used for power purposes, and to irrigate the valley lands in the vicinity of the city. Owing to its geographical location, as well as to the topographical conditions surrounding it, Missoula is destined to become one of the most important cities in Montana.

It is situated at the western foot of the mountains at the mouth of the Hell Gate Cañon, through which the Northern Pacific Railway is

built, and there is no other pass through the mountains, north or south, for a distance of 250 miles, through which a railroad can be built, and if ever there is another railroad from the east, through Montana, it must of necessity be built down said cañon, and through Missoula, as it is naturally the gateway through the mountains from the east to the Pacific Coast. Pop. (1910) 12,869.

FRANK H. WOODY,
Missoula, Montana.

Missouri, admitted into the Union as a State 10 Aug. 1821; is bounded north by Iowa, south by Arkansas, east by Illinois, Kentucky and Tennessee, west by Nebraska, Kansas and Indian Territory. Capital, Jefferson City. Area, 69,415 square miles. Pop. (1910) 3,293,335.

Topography.—Missouri is divided into two portions, a northern and a southern, by the Missouri River, which flows in an easterly direction from its junction with the Kansas to a point 12 miles above Saint Louis, where it unites with the Mississippi. The surface of the northern portion is broken and hilly, but not mountainous. Well watered, the land is well adapted to agriculture; but in the eastern parts, and especially along the bluffs of the two great rivers, much timber land is found. The southern portion is about equally divided between timber land in the east and arable land in the west. In the southeast the Ozark Hills form a table-land, rising high above the level of the sea. The southeastern lowlands have an undulating surface, easily drained, with fertile ridges generally running north and south, forests of oak, hickory, elm, maple, ash, locust, willow, persimmon, pecan, chestnut, and cherry trees. In the lowest places are found swamps and morasses. From the mouth of the Meramec River, 25 miles below Saint Louis to Saint Genevieve, rise high, rocky bluffs, sometimes 150 feet above the water, and from Saint Genevieve to the Arkansas border extend low bottom lands with many small lakes and sloughs. The southeast corner of the State is 275 feet above the sea, the northeast 445 feet, and the northwest 1,000 feet.

River Systems.—The Mississippi flows along the eastern shore of the State, its greatest tributary being the Missouri. From the Ozark Hills the Osage, the Gasconade, and other smaller streams flow to the north and east into the Missouri. The Meramec flows through a hilly, wooded country, in a northeasterly direction, and empties into the Mississippi near Saint Louis.

Climate.—Missouri lies far from the ocean and unprotected by mountain ranges. Its climate, therefore, is one of extremes in heat and cold, moisture and drought. The highest range of mountains in the State, in the Ozark region, is lofty enough to influence somewhat the climate of the neighboring country, but not sufficiently so to affect that of the State at large. The mean summer temperature, as shown by observations extending over a period of 20 years, has ranged from 79° in the northwest of the State to 78.5° in the southeast, but the thermometer often indicates a temperature of more than 100°. The winter temperature during this period has averaged 33.87° for the State, varying from 28.5 in the northeast and 39.5 in the southeast. The winter climate is exceedingly variable. Sometimes the temperature falls below zero. In some winters the temperature scarcely reaches zero. In others a temperature of 20°

MISSOURI

and more below zero has been registered. Now and then the Mississippi at Saint Louis freezes over so that loaded wagons can cross for weeks at a time. This, however, is partly caused by the masses of floating ice coming down from above, which accumulate above the piers of the bridges. Sometimes the river remains open until the middle of February, and again is closed for the season early in December. The Missouri River is often entirely closed during the winter season. The mean annual temperature of the State varies from 53° to 58°. In spite of abundant rains, especially in the spring, the climate is, on the whole, a dry one, evaporation being so rapid that the atmosphere is seldom overloaded with moisture. The driest month is usually April. A clear sky, salubrious soil and climate, with an unusual amount of fair weather, are chief among the natural advantages of Missouri.

Farming and Stock Raising.—The staple products of Missouri are wheat, oats, Indian corn, and tobacco, but in the southern portions of the State cotton, hemp and flax are also raised to some extent. Thirty bushels of wheat to the acre is an average yield, which is often far exceeded. The flour from Missouri wheat is in great demand in the foreign as well as the home markets, and is regarded as of very high quality. All kinds of grass which favor the raising of stock grow luxuriantly, such as blue grass, timothy, red top, red and white clover. The raising of pork is a large industry, on account of the cheapness of corn. All kinds of fruit are successfully cultivated, not only the more hardy fruits such as the apple, pear, plum, and cherry, but those which require a softer climate, such as apricots, nectarines, figs, and many varieties of grapes. Apples and peaches grow well in all parts of the State. Very many varieties of grapes are found, especially in the southern part of the State, from which large quantities of wine are made. In the production of both red and white wines Missouri may be said to compete successfully with any of the vine-growing States of the Union. In the southern counties of Missouri sheep raising has been carried on with profit, the mild climate, the quality of the grass, and the abundance of good water being especially favorable here to this branch of agricultural industry. There are in Missouri in round numbers 24,528,000 acres of improved, and 10,000,000 acres of unimproved land, including 9,000,000 acres of woodland.

The value of farms (1910), including land and improvements (except buildings), is estimated at \$1,441,320,000; the value of buildings, \$268,976,000; of implements and machinery \$30,769,000; and of live stock, \$160,540,000. In 1910 there were on the farms throughout the State 1,005,000 horses; 200,000 mules, asses and burros; 3,090,000 milkcows and other cattle; 957,000 sheep; 2,714,000 swine. Missouri ranks fifth among the corn producing States of the Union. In the culture of tobacco it may be put alongside of Kentucky, Virginia, Tennessee, and Maryland. Tobacco is a staple article in the northern central part of the State, in the rich counties bordering upon the Missouri River. No State in the Union raises so many mules and hogs. The annual production of cereals, according to recent statistics, was as follows: corn, 213,840,000 bushels; wheat, 28,562,000 bushels; rye, 225,000 bushels; oats, 18,630,000 bushels; buckwheat, 21,480

bushels; barley, 28,969 bushels; 4,326,896 tons of hay and forage were produced in 1899; 743,377 bushels of sweet potatoes and 629,143 bushels of Irish potatoes. The production of tobacco was 4,225,000 pounds. Fruit was raised as follows: apples, 8,098,170 bushels; peaches, 61,006 bushels; grapes, 13,783,656 pounds; cherries, 62,708 bushels.

Geology and Mining.—Missouri has large deposits of coal, iron, lead, zinc, and clays for the manufacture of the ordinary brick and for fire brick. The Missouri coal mines are easily worked, and include upper, middle and lower measures. In the upper measures are about four feet of coal, which is found within an area of about 8,400 square miles. In the middle coal measures there are about 7 feet of coal within an area of about 2,000 square miles. The coal in the lower measures is found in several seams bearing from 1½ feet to 4½ feet in thickness. About 4,000,000 tons (of 2,000 pounds) of bituminous coal were mined in Missouri, the value at the mine being \$5,000,000. Great deposits of iron ore have been found in Iron Mountain in the southeastern part of the State, in Shepard Mountain and at Pilot Knob. The Scotia Iron Banks and Iron Ridge also furnish ores which in appearance and character are generally found in boulders imbedded in soft red hematite. While the chief deposits of iron ores are found in the above mentioned places, smaller deposits are found throughout the hilly regions of the southern part of the State, especially in the counties of Saint Genevieve, Madison, Saint Francois, Cape Girardeau, Bollinger, Wayne, Stoddard, Washington, Reynolds, Shannon, Carter, and Ripley. The supply of iron ores may be said to be practically inexhaustible. Lead is found in vast deposits in the southern part of the State. The great lead region through which lead ore is very generally disseminated, occupies about one half of the northern portion of Madison County and a somewhat larger territory in Saint Francois County. The lead is found in the magnesian limestone, and although the percentage of lead in the ore is small, when worked upon a large scale a good profit ensues. The great lead mines of Granby were in the early history of the lead industry in Missouri the best known in the State. Millions of pounds of lead have from time to time been taken from these lands. Of late years the neighborhood of Bonne Terre, in which are located the works of the Saint Joseph Lead Company, has been occupied by several corporations under whose direction vast quantities of lead are obtained every year. It is doubtful whether any other section in the country, or perhaps in the world, produces so much lead each year as is produced in these works. The total production of Missouri lead for the year amounts nominally to about 300,000 tons as compared with 28,000 tons for the year 1900.

Zinc is found in the shape of sulphide, and also silicate of zinc, in nearly all the lead mines of southwestern Missouri. A quarter of a century ago it was found in such masses as to hinder mining operations, and on account of the lack of railroad facilities it was thrown aside as worthless until vast quantities of it had accumulated. Of late years, however, zinc has been an important and profitable adjunct of the lead mines of Missouri. Small quantities of cobalt and some nickel are found in the lead

MISSOURI

mines of the southeast. Building stone of all kinds, including marble, limestone, sandstone, and both red and gray granite, abound in Missouri, and constitute an important item in the mineral values of the State.

Manufactures—Outside of the city of Saint Louis the leading manufacturing counties are Jackson, Buchanan, Saint Charles, Marion, Franklin, Greene, Cape Girardeau, Platte, Boone, and Lafayette. Saint Louis produces about three fourths of the manufactured products of the State. Among the chief manufacturing industries of Saint Louis, according to the census of 1900, are the following:

Boots and shoes, valued at.....	\$ 2,765,434
Carriage and wagon material.....	4,033,799
Railroad cars	4,974,548
Street cars	2,406,836
Clothing	2,177,444
Flouring and grist mill products.....	4,004,024
Malt liquors	11,673,999
Slaughtering and meat packing.....	12,667,333
Tobacco in various forms.....	26,067,470

Kansas City and Saint Joseph are important centres of manufacture, especially of meat products. The valuation of all the industries of Kansas City in 1900 was \$36,527,304, including:

Agricultural implements.....	\$ 438,089
Corn and general shop construction.....	578,030
Clothing (factory product).....	1,123,739
Confectionery	1,935,488
Flouring and grist mill products.....	2,070,111
Foundry and machine shop products.....	7,043,448
Printing and publishing (book and job).....	1,187,333
Tobacco in various forms.....	224,303

In 1900 the value of products in Saint Joseph was \$31,690,736, among which are:

Car and shop construction.....	\$ 639,351
Clothing (factory product).....	1,783,393
Flouring and grist mill products.....	956,576
Slaughtering and meat packing.....	19,009,333

In Springfield the total value of products was \$4,126,871; in Joplin, \$2,061,793, of which \$992,421 belonged to foundry and machine shop products.

Railroads—Many important systems of railroads traverse the State, connecting at different points with the great trunk lines leading to all parts of the country. About 30 railroads have their entrance into the great Union Station at Saint Louis. Besides these main lines many cross lines and electric roads have been constructed and are in process of construction throughout the State. The leading trunk lines with eastern branches are the Wabash, the Pennsylvania, the Baltimore & Ohio Southwest-ern, and several lines running directly to Chicago, namely, the Illinois Central, the Chicago & Alton, Wabash, Rock Island, Chicago, Burlington & Quincy. The lines running to the west, northwest and southwest are the Missouri Pacific, which connects at various points with the great southwestern lines; the Wabash; the Chicago, Burlington & Quincy; the Rock Island; the Iron Mountain, which is included in the Missouri Pacific system; the San Francisco, included in the Rock Island system. These are the leading railroads, which connect at many points with all the great thoroughfares of the United States. River transportation for freight has been revived in late years, and large quantities of cereal products especially are taken to New Orleans from Saint Louis by river and there transferred to the ocean-going steamships. About 2,900,000 bushels of wheat and 300,000 bushels of corn go yearly to foreign markets by river from Saint Louis via New Orleans.

Finances—In 1910 the assessed valuation of the State was \$1,547,126,736. The bonded debt

1 Jan. 1910, was \$4,398,830. The State certificates of indebtedness amounted on 1 Jan. 1901, to \$3,158,000. The tax rate in 1895 was \$5.75 per \$1,000; in 1910, \$1.70 per \$1,000. In 1910 the assessed valuation of all the taxable property in the city of Saint Louis was \$564,875,780, which was regarded as 66 per cent of the actual value. The tax rate was \$2.22 per \$100. The net public debt was \$27,815,311. In Kansas City in 1910 the assessed valuation of all taxable property was \$155,500,707.25 about 40 per cent of the actual value. The tax rate was \$1.25 per \$100, and the net public debt \$4,472,830.89.

Banks—In 1910 there were 118 National banks in Missouri, with savings deposits of \$9,819,903.97, and over 21,000 depositors. There are 730 incorporated State banks with savings deposits of about \$20,000,000. There are also 39 private banks and in the large cities, trust companies, with a large amount of capital. There are in Saint Louis over 30 banks and trust companies, with a total capital and surplus of about \$100,000,000. In the year 1872 there were 58 banks with a capital and surplus of \$20,196,098, showing that while during the 40 years the number of banks has decreased by 25, indicating a greater consolidation and strength of interest, the amount of capital and surplus has more than quadrupled.

Education—Missouri has a public school system of education, adopted in 1839. There are district schools, elementary and ungraded; city schools, graded, with high school courses. There are four normal schools maintained by the State, and a State University. The State University is supported by what is called "The permanent Endowment," consisting of certificates of indebtedness amounting to a total of \$1,235,839, and in a single year the total appropriations made by the Legislature of the State for the entire University, including all departments, was \$586,400. The total amount of funds for the use of public schools is \$17,150,000. From the income of this amount there was paid in 1909 for teachers' wages the sum of \$7,688,684 in the city, town and village schools.

In Saint Louis in 1902 the estimated value of school property was \$7,960,445; the total receipts from all sources for the use of the schools was \$2,447,016; and the total expenditures \$2,189,648, of which \$1,163,985 was paid for teachers' wages. Free public schools for white and colored children between the ages of 6 and 20 years are required by law for every district in the State. Besides these institutions supported by the State there are also many private institutions of all grades, for both sexes. Chief among these may be mentioned the Saint Louis University, founded in 1820, under the control of the Jesuit Order of the Roman Catholic Church, with buildings on the college premises representing a total value of about \$1,000,000; Washington University in Saint Louis, a non-sectarian institution, which has property estimated at about \$7,000,000; William Jewell College, at Liberty, Mo., in charge of the Baptist denomination; Drury College (Congregational) at Springfield, Mo.; Central College (Southern Methodist) at Fayette, Mo.; Westminster College (Presbyterian) at Fulton, Mo.; and others under the control of various religious bodies through the State. The value of buildings and grounds of private educational institutions

MISSOURI

was, in 1902, \$6,740,437, and the amount of permanent endowment was \$8,688,232.

Churches.—The first settlers of Missouri were Roman Catholics. In 1819 Christ Church (Protestant Episcopal) was founded in Saint Louis, and soon various religious bodies established themselves in all parts of the State. In the cities and towns along the great rivers the Roman Catholic Church is to-day very strong, and its members are numerous throughout the State. The Methodists (both Northern and Southern wings), the Baptists, the Presbyterians (several branches), and the Episcopalian are the leading Protestant bodies as to numbers, in the order named. Each of these organizations except the Episcopalian has a college supported mainly by its members, and the Roman Catholics have, chiefly in the cities, their parochial schools.

Charitable and Penal Institutions.—The State penitentiary is located at Jefferson City. The number of prisoners is about 2,000. In the last official report the number of white males was given as 1,267; white females, 48; persons of foreign birth, 116; natives, 1,935. The State appropriated in 1900, \$80,000 for the support of the penitentiary. The profits from labor exceeded this amount by \$50,000. At Booneville is a Reform School for boys with 339 inmates. This school is maintained by the counties from which the boys are sent and costs about \$23,000 a year. At Chillicothe is the Girls' Industrial School, upon which is expended annually \$14,000. A refuge for the feeble-minded has been established at Marshall, and at Fulton, Saint Joseph, Nevada and Farmington are State asylums for the insane. The State also aids to some extent the insane asylum at Saint Louis, mainly supported by the city. At Higginsville is the Confederate Home, supported at an annual cost of \$46,000, and at Saint James the Federal Soldiers' Home, which costs \$30,000 a year.

Government.—The present constitution of Missouri was adopted by popular vote in 1875, after a convention called for that purpose had framed it and recommended it for adoption. The Legislature, consisting of a Senate and a House of Representatives, meets biennially on the Wednesday after the first day of January following the election of members. The pay of members is not to exceed \$5 a day for 70 days, and if the session is further prolonged, an allowance of only \$1 a day is made for the remainder of the session. Mileage is also allowed to members. In the executive department are a Governor, a Lieutenant Governor, a Secretary of State, a State Auditor, State Treasurer, Attorney General, and a Superintendent of Public Instruction. The Governor, in whom is vested the supreme executive power, is chosen for 4 years, as also are other members of the executive department. The Governor has a qualified veto upon the acts of the Legislature. The State judicial authority is vested in a Supreme Court, the Saint Louis Court of Appeals, the Kansas City Court of Appeals, the State Circuit Courts, Criminal Courts, Probate Courts, and Municipal Courts. The judges and officers of the courts are elected by the people. Judges of the Supreme Court are elected for 10 years; of the Saint Louis and Kansas City Courts of Appeals for 12 years; of the Circuit Courts for 6 years. The House of Representatives has the right of impeachment of executive and judicial officers. The Senate tries all cases

of impeachment. Every male citizen of the United States and every male person of foreign birth who may have declared his intention to become a citizen of the United States according to law, not less than one year nor more than five years before he offers to vote, who is over the age of 21 years, is entitled to vote at all elections by the people if he has resided in the State one year immediately preceding the election, and has resided in the county, city or town where he shall offer to vote at least 60 days immediately preceding the election.

Politics.—Missouri for more than 30 years was a Democratic State. The vote of the State for presidential electors in 1880 was as follows: Democratic, 208,609; Republican, 155,567; other parties about 80,000. In 1892 the Democratic vote was 268,398; Republican, 226,918; other parties about 85,000. In 1908, however, the Democratic vote was 346,574; the Republican, 347,203; other parties about 19,000.

Population.—Missouri is divided into 115 counties. The following table gives the number of inhabitants since 1850:

Year	Males	Females	Total	Density per sq. mile
1850.....	357,832	324,213	682,045	14.37
1860.....	672,201	559,811	1,232,012	18.08
1870.....	896,347	724,948	1,621,295	26.24
1880.....	1,127,187	904,193	2,031,380	31.53
1890.....	1,385,238	1,093,940	2,479,178	39.
1900.....	2,595,710	2,510,955	5,106,665	45.2
1910.....			5,993,335	47.9

In 1900 the foreign born residents numbered 216,379. There were also 161,234 persons of negro descent. The early settlers of the State were foreign and the population remained French for 50 years after the first settlement. The descendants of those early French families are still to be found in Saint Louis and in many of the older towns. Many Germans have settled in Missouri, especially in Saint Louis, Saint Charles, Saint Joseph, Kansas City, as well as in many of the smaller towns, and a considerable part of the population is made up of English, Irish, Scotch, and Swedes. The native American population until a generation ago was mostly descended from immigrants from the States of Kentucky, Tennessee, North Carolina, and Virginia, but during the last 40 years a large accession to the population has come from the eastern and northwestern States. Saint Louis, the largest city in the State and the most important in the Mississippi Valley, situated upon the Mississippi River, about 12 miles below its junction with the Missouri, had a population in 1910 of 687,029. Kansas City, the next largest town in Missouri, on the western border of the State, had in 1910, 248,381. Saint Joseph, in the northwestern part of the State, 77,403; Hannibal, a river town in the eastern part of the State, 18,341; Sedalia, in the central part of the State, 17,822; Jefferson City, the capital, 11,850.

History.—Missouri is a part of the territory of which La Salle, the French voyager and discoverer, took possession on 9 April 1682, which he named Louisiana in honor of the king of France, Louis XIV. The first settlements in Missouri were made at Saint Genevieve and

MISSOURI.

STATE CAPITOL AT JEFFERSON CITY

MISSOURI

New Bourbon, the exact dates of which are unknown. Some say in 1763; others, supported by traditions, as early as 1755. Saint Louis was settled by Pierre Laclède Liguest, a Frenchman. The place for the settlement was selected in 1763 and in February 1764, August Chouteau, at the order of Liguest, began the erection of a village. Settlements of the future State of Missouri were for many years confined to the banks of the river. In 1803 all that tract of land called Louisiana was purchased from the French by the United States government, and under an act of Congress passed 31 Oct. 1803, the transfer of Lower Louisiana was made on 18 December 1803. The next year the territory was divided by Congress into two portions; the northern part, commonly called Upper Louisiana, was taken possession of on March 1804. Missouri was organized as a territory in June 1812. The first Governor was William Clark, who served from 1813 to 1820. The application of Missouri for admission to the Union as a State in 1818 was followed by two years of earnest controversy, which excited the whole country and endangered the very existence of the Union. The controversy had as its foundation an attempt to prevent the admission of Missouri to the Union except as an anti-slavery State. This controversy was finally settled by the admission of Missouri upon what was called the "Missouri Compromise" (q.v.), which forbade the existence of slavery in that part of the Louisiana Purchase north of 36° 30', except in Missouri; and Missouri was admitted to the Union on 21 Aug. 1821. The constitution adopted upon admission remained practically unchanged until 1865. The first Governor under the State constitution was Alexander McNair. Saint Charles was first fixed upon as the seat of government in 1820, but in 1826 the capital was removed to Jefferson City, where it still remains. The first official census of the State, which was taken in 1821, showed that there were in all 70,647 inhabitants, of whom 11,254 were slaves. Missouri troops had their share in the various Indian wars, such as the Black Hawk war in 1832; the Florida war in 1837, and afterward in the Mexican war in 1846. Being a border State and a slave State as well, in all the troubles preceding the outbreak of the War of the Rebellion Missouri was deeply concerned. In many parts of the State the sentiment was strongly in favor of secession. Governor Jackson in January 1861, declared that Missouri must take its stand by the side of slave-holding States whatever they might decide to do. A convention was called to consider the affairs of the nation and in that convention it was made clear that the public sentiment was hostile to secession, and the convention succeeded in preventing any committal of the State to secession. United States troops were gathered at Saint Louis. Attempts made to take possession of the United States arsenal at Saint Louis, with its equipment, by the Secessionists were defeated, and within a few months after the outbreak of the War the greater part of the State was under the control of the United States forces. Governor Jackson declared the State out of the Union, and Confederate forces were assembled in the southwestern part of the State, but the State Convention which had met before now convened again and declared the executive offices vacant and the seats of members of the Legis-

lature also vacant, and the executive offices were then filled by appointment by the convention. At the battle of Wilson's Creek, near Springfield, General Lyon, who had been a strong Union leader, was killed, and General Fremont, who had been placed in charge of the Department of the West, declared martial law throughout the State. At the beginning of the year 1862 the Confederates held nearly half the State, but their strength waned soon afterward and after the beginning of the year 1864 no further trouble arose in Missouri.

The State furnished to the United States during the Civil War 108,773 troops. In 1865 a new constitution was adopted by the people, and in 1869, by a large majority, the 15th amendment to the United States Constitution was adopted. In 1875 a convention was called to draw up a new State constitution. This constitution of 1875 was ratified by the people, and has since then been the fundamental law of the State, modified in some minor particulars by amendments adopted from time to time.

MARSHALL S. SNOW,

Professor of History, Washington University.

Missouri, a river in the United States, the largest tributary of the Mississippi. Its headwaters are in southwestern Montana, and the Missouri River proper begins at the confluence of the Jefferson, Madison, and Gallatin rivers. The Madison has its source in Yellowstone Park, near the headwaters of Yellowstone River and the geysers in the western part of the park. The Gallatin also has its rise in the same park and not far from the source of the Yellowstone and Madison rivers. The Jefferson rises farther west, its headwaters are near the source of the Snake River. The Missouri from the confluence of the three rivers flows north and east to the Bear Paw Mountains, when it turns and flows south and east a distance of about 50 miles, when again the course changes toward the east, from the 108th meridian to about 107° 30' northeast, then east to North Dakota, which State it enters at 48° N. It has a very irregular course in the northwestern part of North Dakota, but it is generally southeast to South Dakota, which State it enters at 100° 20' W. It crosses the State of South Dakota, marking an irregular course, generally in a southeasterly direction to the boundary of Nebraska at 42° 45' N. From here it forms the boundary between South Dakota and Nebraska to Iowa at 42° 20', when it turns south and forms the boundary between Nebraska and Iowa, Nebraska and Missouri, and Kansas and Missouri to Kansas City, where it enters the State of Missouri, flows east by north to Brunswick, then east by south, making two large curves, to the Mississippi which river it enters 20 miles north of Saint Louis. The length of the whole course from the source of the Madison River is about 2,915 miles, from the source of the Jefferson about 3,000 miles. From its source to the mouth of the Mississippi River is a total length of 4,200 miles, the longest continuous water-way in the world. There are some peculiar irregularities along its course, one in Montana, where the Mussachell River enters, is in the form of a 'V,' its opening toward the north, the point where the Mussachell enters, and the sides about 12 miles long. Along the course in each State there are long narrow loops, enclosing lands which

MISSOURI

are almost islands; across the State of Missouri the river forms three crescents, one pointing north and two pointing south.

The Missouri is noted for the great amount of suspended silt it always carries and which has given it the name "Big Muddy." This silt is deposited in reefs which change the current, and frequently much damage results. In 1903 considerable damages were sustained by the washing away or grinding away of portions of Decatur, and Covington in Nebraska, Sioux City in Iowa, and Yankton in South Dakota. The river follows no known rules as to when or where it will deposit its burden of silt, change its current, and begin to destroy a solid shore line. Dikes and stone walls have been constructed in many places. In the upper part of its course the Missouri passes through the "Gate of the Rocky Mountains," a gorge about six miles long and having perpendicular walls about 1,200 feet in height. At Great Falls, Mont., there are a series of falls making a vertical descent of 350 feet in 16 miles. The highest falls is 87 feet.

The chief tributaries are, in Missouri, the Osage and Kansas; in Nebraska, the Platte and Niobrara; a large number of short streams in Iowa; the Big Sioux, White, James, and Cheyenne, in South Dakota; the Little Missouri in North Dakota; and the Yellowstone and Milk in Montana. The extent of country drained by the Missouri and its tributaries is about 500,000 square miles or nearly two fifths of the whole Mississippi basin. The northern point of the basin of the Missouri extends almost to the Saskatchewan River. The Missouri is a swiftly flowing stream in its upper course, and for a distance of about 500 miles it presents scenes of almost unequaled grandeur. It forces its way through narrow gorges, foams over cataracts, and winds around mountains. In the lower part of its course the waters move more slowly on its journeys across the vast plains. It is navigable in summer, during the flood period, to Great Falls, Mont., and in low water as far as Buford at the mouth of the Yellowstone River. The flat-bottomed steamboats are necessarily those used for navigation on the Missouri.

The principal cities on the river from the upper course to its mouth, are Great Falls and Fort Benton in Montana; Bismarck, the capital of North Dakota; Pierre the capital of South Dakota; Sioux City, Ia.; Omaha, Neb.; Atchison, Leavenworth, and Kansas City, Kan.; Kansas City and Jefferson City, Mo. That portion of Iowa lying near the mouth of the Little Sioux and north for about 70 miles, between the Missouri and the Little Missouri, is below the level of the Missouri from 8 to 32 feet. The area of the tract below water level is about 840 square miles, and embraces some of the finest farms and most prosperous towns of the State. It is proposed (1903) to straighten the Little Sioux and to improve the channels and outlets so as to prevent inundations, and also to improve the drainage of this fertile and populous region.

The history of this river is connected with the history of the early explorers and missionaries and with the lives of the miners and settlers of the latter part of the 19th century. The possibilities in the unused water-power of its upper course are enormous. The great prairies through which the river passes on its

lower course contain the most productive lands in the United States.

Missouri, or Gourd-seed, Stucker, a fish. See BLACKHORSE.

Missouri Compromise, in American politics, a term given to a compromise under an act of Congress passed in February 1821, at which time Missouri was admitted into the Union as a slave State, declaring that all territory west of Missouri and north of lat. 36° 30' should forever be free from slavery. This compromise was virtually repealed in 1854, when territorial governments were established for Kansas and Nebraska. See KANSAS, History; KANSAS-NEBRASKA BILL; MISSOURI.

Missouri, University of, the State university located at Columbia, Boone County. It was chartered by the legislature in 1839, the cornerstone of the main building was laid in July 1840, and instruction in academic work was begun in 1841. The organization comprises eight departments: (1) Graduate Department established 1896; (2) Academic Department; (3) Department of Education (1868); (4) Law (1872); (5) Medicine (1873); (6) Military Science and Tactics (1890); (7) College of Agriculture and Mechanic Arts (1870); (8) School of Mines and Metallurgy (1870), situated at Rolla. The College of Agriculture includes the School of Agriculture, the School of Engineering and the State Experiment Station. The School of Engineering offers courses in civil, electrical, mechanical, sanitary, chemical and hydraulic engineering; the course in the School of Mines includes mining and civil engineering. The degrees conferred are bachelor of arts, bachelor of laws, bachelor of science (in the College of Agriculture and the Mechanic Arts, and the School of Mines and Metallurgy), and doctor of medicine; also the graduate degrees, master of arts, doctor of philosophy, master of science, master of laws, civil engineer, electrical engineer, mechanical engineer, sanitary engineer, engineer of mines, and civil engineer. In 1869 women were admitted to the Normal Department (Department of Education), in 1870 to the Academic Department, and soon afterward to all existing departments; they are now admitted on equal terms to all departments except the Department of Military Science and Tactics. A dormitory for women has been erected on the horticultural grounds which adjoin the regular campus. The University Library includes the general library, 10 departmental libraries and the library of the School of Mines. There being no separate library building, the general library, the classical library, the political science library and the romance library are in Academic Hall; other departmental libraries are in the buildings of their respective departments, the library of the School of Mines being at Rolla; these libraries contained in all about 65,000 volumes in 1910. There are rooms in Academic Hall set apart for gymnasium work for men and women, and there is also an athletic field; competitive athletics and inter-collegiate contests are encouraged, and though regarded as essentially a student enterprise, are under supervision by the faculty. In 1868, the State for the first time gave aid to the University, and has since made several appropriations for special

MISSOURI VALLEY — MITCHEL

purpose; the endowment is about \$2,300,000; and the annual income in 1910 was \$710,000. The students numbered 2,368 in 1910 and the faculty, 162.

Missouri Valley, Iowa, city in Harrison County; on the Sioux City & P., the Chicago & N., and the Fremont, E. & M. V. R.R.'s; about 120 miles west of Des Moines, the capital of the State, and 20 miles north of Council Bluffs. The industrial establishments are large railroad shops, machine-shops, flour mills, dairy products, bricks, coffins, grain elevators, and stock yards. The fair grounds of the County Agricultural Society are located here. It has a public library of about 2,000 volumes. The city owns and operates the waterworks. Pop. (1910) 4,000.

Missouri Valley College, in Marshal, Mo., a coeducational institution, founded under the auspices of the Cumberland Presbyterians in 1880. The courses lead to the degrees of A.B. and Ph.D. In 1910 there were 13 instructors and professors, 214 students. There were about 7,200 volumes in the library, and the grounds, buildings, and apparatus were valued at \$125,000; the productive funds at \$113,000, and the annual income about \$19,000. The number of graduates were about 350.

Mist. See **Fog**.

Mistake, a term commonly used as the equivalent of blunder, error, erratum, and particularly employed in law of a misconception affecting action. In general the law, by an extension of the rule that ignorance is no excuse, makes a mistake without remedy. This is not true, however, in any misapprehension which may be brought under the law of contracts or the principle of quasi-contract. So, too, in equity there is a possibility of relief for mistake and its consequences.

Mistassini, mis-täs-sä-né, Canada, a lake of the Ungava district, about 300 miles north of Quebec, and due east from the southern point of James Bay in Hudson Bay. It consists of two parallel narrow portions separated by a chain of islands, the western and larger portion being about 100 miles long, and 10 or 12 broad. It has a depth of between 300 and 400 feet. It drains by Rupert's River into James Bay. The waters of Mistassini teem with fish, while its shores are densely wooded. The lake was first visited by French missionaries in 1671, but was not surveyed until 1884. The Hudson's Bay Company maintains a trading-post on the lake.

Mistec. See **Mixtec**.

Mistle-thrush, or **Stormcock**, British names for a large European thrush (*Turdus viscivorus*), whose fine song is heard for a longer season than in the case of most birds, and on rainy days as well as sunny. Its common name is due to its unusual fondness for the berries of the mistletoe. In plumage it resembles the American wood-thrush.

Mistletoe, a popular name for several related shrubs parasitic upon various deciduous trees such as apple, thorn, maple, poplar, locust, linden, and occasionally oak. The European or common mistletoe (*Viscum album*) of the natural order *Loranthaceae*, is the one referred to in poetry and prose but a relative, named *Phoradendron flavescens*, is the species most commonly found at Christmas time in the markets of America. The former which is com-

mon almost throughout Europe, is an evergreen, bifurcately branched shrub, with opposite, almost sessile, oblong, leathery leaves; inconspicuous flowers in small terminal heads or in the angles of the branches, the pistillate and staminate flowers upon separate plants; and whitish, translucent, glutinous berries about a quarter of an inch in diameter. The stickiness serves to attach the berries to the host plant until germination is complete, the sprout, it is said, always turning toward the point of attachment. The American or false mistletoe is similar in habit and appearance, and has fallen heir to some of the traditions and functions of its European cousin, especially the Christmas practice of kissing under a suspended sprig. Anciently the European species was held to be sacred by the Druids and the Germans, and by the Celts was credited with magical properties, references to all of which are frequent in literature. Its formerly reputed value in medicine has also passed away. Several other species are well known, especially the fragrant flowered *Loranthus odoratus*, and *L. europæus*; the latter being distinguished for its racemes of flowers and its frequent appearance upon oak trees. The common American species mentioned above ranges from New Jersey to Indiana and southward to Florida and Texas. Several related species are found on the Pacific coast.

Mistral, Frédéric, frâ-dâ-rêk mës-trâl (or Frédari), French poet. b. Maillane, Bouches-du-Rhône, 8 Sept. 1830. He studied law for a time at Aix, but soon abandoned it, and gave his attention to writing in Provençal, the dialect of southern France, which, under the influence of Jasmin, the "barber-poet," had entered on a renaissance as a literary medium. In 1854 he, with six others, founded the well-known Society of the Félibrige; and in 1859 he published his 'Miréio,' a narrative poem in the recovered language, which was crowned by the Académie in 1861. A second work in verse, 'Calendari,' came out in 1867; a volume of poems, 'Lis Isclo d'Or' (The Isles of Gold), in 1875; 'Lou Trésor dou Félibrige,' a dictionary of modern Provençal, in 1878-86; and the historical poem 'Nerto,' in 1884. 'La Rèino Jano' (1890) is a tragedy, and 'Le Poème du Rhône' (1879), another narrative poem. There are English renderings of 'Miréio' by Grant (1867), Crichton (1868), and Preston (1879). In 1904 he was awarded, jointly with José Eschegaray (q.v.) the Nobel prize in literature. Consult: Downer, 'Frédéric Mistral' (1901).

Mistral, the local or provincial name of a strong northwest wind, which, blowing from the Alps, forms one of the scourges of Provence and the valley of the Rhône. It blows with great violence during the winter and spring months. Its approach is indicated by a sudden change in the temperature from warmth to cold; the air becomes purer and more invigorating, light fleecy clouds are seen in the sky, and at night the stars shine with extraordinary brightness.

Mitchel, mich'el, John, Irish patriot: b. Dungiven, County Derry, 3 Nov. 1815; d. Cork 20 March 1875. He was graduated from Trinity College, Dublin, in 1836, and practised several years as an attorney at Banbridge. Soon after the starting of the 'Nation' in 1842, Mitchell began to contribute to that journal and after the death of Thomas Davis, in 1845, became

MITCHELL—MITCHELL

assistant editor. In 1846 he began the publication of the 'United Irishman,' for his articles in which he was sentenced to 14 years' transportation for felony. He was sent to Bermuda, and next to Tasmania, whence he made his escape to the United States in the summer of 1853. Here he published a series of short-lived newspapers, the 'Citizen' (at New York), the 'Southern Citizen' (Knoxville, Tenn.), the 'Inquirer' (Richmond, Va.), and the 'Irish Citizen' (New York.) His advocacy of slavery did much to lessen American interest in him, and in 1874 he returned to Ireland. He was elected to Parliament from Tipperary, was declared ineligible, but was re-elected. Among his writings are: 'Life of Hugh O'Neill' (1845); 'Jail Journal; or Five Years in British Prisons' (1854), and a 'History of Ireland from the Treaty of Limerick' (1868).

Mitchell, Ormsby McKnight, American astronomer: b. Morgansfield, Ky., 10 July 1810; d. Hilton Head, S. C., 30 Oct. 1862. He was graduated from West Point in 1829, and was made assistant professor of mathematics there, which post he held for two years. From 1832 to 1834 he was counsellor at law in Cincinnati, Ohio; from 1834 to 1844 professor of mathematics, philosophy, and astronomy at Cincinnati College; and 1836-7 chief engineer of the Little Miami railroad. He lectured in various parts of the United States on astronomy in 1842-3, raised funds for the building of an observatory at Cincinnati, the cornerstone of which was laid 9 Nov. 1843, and was its director in 1845-59. In 1859 he became director of the Dudley Observatory at Albany, N. Y. He was known as a popular lecturer on astronomy, and scarcely less distinguished for his mechanical skill. He perfected a variety of apparatus of great use to astronomy. One of the most important of his constructions was an apparatus for recording right ascensions and declinations to within 1/100 of a second. He also invented an instrument for the measurement with great accuracy of large differences of declination, such as the ordinary method by micrometer was unable to reach. In 1861 he entered the Federal army as brigadier-general of Ohio volunteers, and on 11 April 1862 was promoted major-general. From 17 Sept. he commanded the department of the South and the Tenth corps, operating in South Carolina. He was known in the army as "Old Stars." He was a fellow of the American Academy of Arts and Sciences and an associate of the Royal Astronomical Society of London. He published and edited 'The Sideral Messenger' (1849-58), and wrote: 'The Planetary and Stellar Worlds' (1848); 'The Orbs of Heaven' (1851); 'A Concise Elementary Treatise of the Sun, Planets, Satellites, and Comets' (1860); and 'The Astronomy of the Bible' (1865).

Mitchell, Mich'el, Clifford, American physician: b. Nantucket, Mass., 28 Jan. 1854. He was graduated at Harvard in 1875; studied medicine in Chicago in the Medical College and the Homoeopathic Medical College; began to practice in Chicago in 1878; and devoted himself to diseases of the kidneys. In 1902 he established the Chicago Laboratory for Clinical Diagnosis. He is professor of chemistry, toxicology and renal diseases in the Chicago Homoeopathic College and author of 'Student's Manual of Urinary Analysis' (1879), 'Physician's Chemis-

try' (1884), 'Dentist's Manual of Special Chemistry' (1889), 'Renal Therapeutics' (1898), and 'Diseases of the Urinary Organs' (1903), etc.

Mitchell, Donald Grant, American author, ("IX MARVEL"): b. Norwich, Conn., 12 April 1827; d. Edgewood, Conn., 15 Dec. 1908. He was graduated at Yale in 1841; studied law in New York; was United States consul to Venice in 1853; and in 1855 settled on his farm, 'Edgewood,' near New Haven. He has written much, on various themes, and always with a genial charm and ease of style. His best known works are the idyllic sketches called 'Reveries of a Bachelor' (1850), and 'Dream Life' (1851). He also wrote 'French Gleanings' (1847), descriptive of his first European trip, as 'The Battle Summer' (1850) was of his stay in Paris in 1848, 'The Lorgnette' (1850), a satiric novel of New York life in the forties; 'Fudge Doings' (1855), another New York society novel; 'Dr. Johns' (1866), a religious story contrasting life in Connecticut and in the French Midi; and the more characteristic papers on men, books, and out-doors, such as 'My Farm at Edgewood' (1863), 'Wet Days at Edgewood' (1865), 'Rural Studies' (1867), 'English Lands, Letters, and Kings' (1889), and 'American Lands and Letters' (1897).

Mitchell, Hinks, American scientist: b. Washington, Conn., 19 Aug. 1793; d. on Mount Mitchell, N. C., 27 June 1857. He was graduated at Yale in 1813; four years later became professor of mathematics in the University of North Carolina; and in 1826 was made professor of chemistry, mineralogy and geology in the same institution. The Olmsted-Mitchell Geological Survey (1824-8) did important work under his supervision. He discovered that a peak in North Carolina is the highest in the eastern States and was killed by a fall from this height, which is now called in his honor Mount Mitchell or Mitchell's High Peak, and on whose summit he is buried.

Mitchell, Henry, American civil engineer: b. Nantucket, Mass., 16 Sept. 1830; d. Boston, Mass., 11 Dec. 1902. He was a son of William Mitchell (q.v.), was educated at the Normal School in Bridgewater, Mass., and in 1851 was appointed to government service as a civil engineer under the United States coast survey. He acted as assistant to the commissioners on harbor encroachments in New York in 1859 and discovered the underflow of the Hudson. He was later engaged in Boston harbor and assisted in the improvement of the mouth of the Mississippi in 1874. He made an investigation of the Panama canal scheme under De Lesseps and held many government commissions to investigate various harbors. He was appointed professor of physical hydrology at the Massachusetts Institute of Technology in 1866, and in 1873 was offered the same post in the Agassiz School of Science but resigned. He published many reports of surveys, etc.

Mitchell, Hinkley Gilbert, American Biblical scholar: b. Lee, Oneida County, N. Y., 22 Feb. 1846. He studied at Wesleyan University, where he was graduated in 1873, at the theological department of Boston University, and at the University of Leipzig. He was instructor at Wesleyan 1880-3, and since 1884 has been professor of Hebrew in Boston University.

MITCHELL

His most important publications are 'Hebrew Lessons' (1884), 'Amos' (1893), 'The Pentateuch' (1893), 'The Theology of the Old Testament' (a translation from the French of Picpombert, 1893), and 'Isaiah, Chapters i.-xii.' (1900).

Mitchell, John, American labor leader: b. Braidwood, Will County, Ill., 4 Feb. 1870. He entered the mines at Braidwood at the age of 13, and in 1885 joined the Knights of Labor. The next few years he spent coal mining in different States of the West and Southwest, and in 1890 settled at Spring Valley, continuing his work at his trade. He read and studied constantly, and was a member of several debating societies and reform clubs, he was also active in the labor movement, and was president of the Knights of Labor local at Spring Valley. On the formation of the United Mine Workers in 1890 he became a member of that organization, was frequently delegate to district conventions and in 1896 was elected secretary-treasurer of the northern Illinois sub-district; in 1896 he was chairman of the Illinois mine workers' legislative committee, and in 1897 was made a national organizer of the United Mine Workers. In January 1898 he was elected vice-president of that organization, and in September of the same year became acting president; he was elected president in 1899, but retired in March 1908; he has also been a vice-president of the American Federation of Labor since 1898. During his term of office as president of the United Mine Workers the union was enlarged, wages were increased, and the eight hour day extended; he conducted the strikes of the anthracite miners in 1900 and 1902, and brought the latter to a close by his offer in behalf of the miners to accept the decisions of a commission appointed by the President of the United States. He is also a member of the Industrial Department of the National Civic Federation.

Mitchell, John Anna, American editor and author: b. New York 17 Jan. 1845. He was educated at Harvard and studied in Boston and Paris and was an architect in Boston in 1870-6, after which he became interested in decorative art and studied art in Paris 1876-80. Returning to New York he engaged in journalism as artist, illustrator and writer and in 1883 founded and has since edited 'Life.' He has published: 'Croquis de l'Exposition' (1879); 'The Romance of the Moon' (1886); 'The Last American' (1889); 'Amos Judd' (1895); 'The Pines of Lory' (1901); etc.

Mitchell, John H., American lawyer: b. Washington County Pa., 22 June 1835; d. Portland, Ore., 8 Dec. 1905. He was educated at Witherspoon Institute, Pa., and was admitted to the bar of Pennsylvania and went to California, where he established a law practice, but in 1860 removed to Oregon and engaged in practice there. He was State senator in 1860-6 and president of the senate in 1864. In 1873-9 and 1885-97 he was United States senator from Oregon and was returned to the Senate in 1901. He was professor at Willamette University, Salem, Ore., in 1867-71.

Mitchell, Maggie. See MITCHELL, MARGARET JULIA.

Mitchell, Margaret Julia ('MAGGIE MITCHELL'), American actress: b. New York 1838.

She made her first appearance on the stage as an infant and before she was five had taken child parts. She made her debut as Julia in 'The Soldier's Daughter' at Burton's Chambers Street Theatre in New York, and as Fanchon, the Cricket, produced in 1860, she made herself famous. She was married to Henry Paddock, her manager, 15 Oct. 1868, and continued her career on the stage, playing in many famous roles. 'The Pearl of Savoy'; 'Nan the Good for Nothing'; 'Jane Eyre'; etc., until her retirement.

Mitchell, Maria, American astronomer: b. Nantucket, Mass., 1 Aug. 1818; d. Lynn, Mass., 28 June 1889. She was the daughter of William Mitchell (q.v.), an astronomer of some note, and when a girl frequently assisted him in his observations. She taught for a time in a private school, and was for 20 years librarian of the Nantucket Athenaeum, but continued to carry on her astronomical studies and observations. She first became known as an astronomer by her discovery of a comet in 1847, and for this discovery she received a medal from the king of Denmark. She later discovered several nebulae, and was engaged in computations for the 'Nautical Almanac,' and on work for the Coast Survey for several years. In 1848 she was elected an honorary member of the American Academy of Arts and Sciences, the first woman to receive this honor, and in 1857 went to Europe, visited the principal observatories, and was received with honor by Herschel, Humboldt, and other noted scientists. In 1865 she was appointed professor of astronomy and director of the observatory at Vassar College. She went to Burlington, Iowa, with some of her students, to observe the total eclipse of the sun in 1869, and on other eclipse expeditions; but for the most part she gave up her research and observation work to devote herself to teaching and building up her department. She was an inspiring and original teacher, and deeply interested in the advancement of the interests of the college; during her later years there she endeavored to raise a fund to endow the chair of astronomy; this fund (\$50,000) was completed after her death and was named in her honor the Maria Mitchell Endowment Fund. She resigned from her position at Vassar in 1888, and was made professor emerita. She was a member of the American Association for the Advancement of Science, and was given the degree of LL.D. by Hanover in 1852 and by Columbia in 1887. She was a believer in woman's suffrage, but not active in the suffragist movement; she was, however, a member, and for several years president, of the American Association for the Advancement of Women.

Mitchell, Peter, Canadian politician: b. Newcastle, New Brunswick, 4 Jan. 1804; d. Montreal 25 Oct. 1899. He studied law and was admitted to the bar in 1848. Shipbuilding and other business pursuits soon engrossed his attention and he abandoned law, but in 1856 entered political life as member of the Canadian Parliament and five years later was appointed a life member of the Legislative Council. Mitchell was one of the foremost in the organization of the Canadian confederation, working for it both in and out of parliament. He was senator in 1867-72 and under the new government became minister of marine and fisheries and was

MITCHELL — MITCHILL

chiefly instrumental in settling the negotiations between United States and Canada over the Bering Sea fisheries. He returned to the parliament in 1874 and remained there until 1896, when he was defeated. He owned the *Montreal Herald*, was president of the Mitchell Steamship Company, and was closely connected with the Canadian Pacific Railway. In 1897 he received an appointment as inspector of the fisheries of the Atlantic provinces. He wrote a review of President Grant's message concerning the fisheries in 1870 and 'Notes of a Holiday Trip' (1880).

Mitchell, Samuel Augustus, American geographer: b. Bristol, Conn., 30 March 1792; d. Philadelphia 20 Dec. 1868. His early life was devoted to teaching in which he was very successful, but the inadequate treatment of geography by the text-books then in use induced him to turn his attention to the making of satisfactory ones and he spent 40 years in Philadelphia in the preparation of his text-books on that subject. So general was their adoption that they reached a sale of 400,000 annually. Besides his geographical text-books, of which there were 24, he edited a new edition of John James Audubon's 'Birds of America' and wrote: 'General View of the World, Physical, Political, and Statistical' (1846), and 'New Traveller's Guide through the United States' (1850).

Mitchell, Silas Weir, American physician, poet, and novelist: b. Philadelphia 15 Feb. 1829. He studied at the University of Pennsylvania, was graduated from Jefferson Medical College in 1850, entered practice in Philadelphia, during the Civil War was in charge of the Turner's Lane United States hospital (Philadelphia) for diseases and injuries of the nervous system, and subsequently was president of the Philadelphia College of Physicians. In his professional capacity he became known for his researches in connection with nervous diseases, and in physiology and toxicology. A bibliography of his publications would supply the titles of some 150 medical papers, recounting investigations of high scientific importance. To a wider degree, however, he is known through his literary work, composed principally of poetry and fiction. He was elected to the American Academy of Arts and Sciences and the National Academy of Sciences, and was also made associate, corresponding, or honorary member of foreign scientific societies. His works in medical science include: 'Researches on the Venom of the Rattlesnake' (1860); 'Gunshot Wounds and other Injuries of Nerves'; 'Reflex Paralysis' (1864); 'On Injuries of the Nerves and their Consequences' (1872); and 'Fat and Blood, and How to Make Them' (1877). Among his other writings are, in verse, 'The Hill of Stones' (1882); 'A Masque' (1887); 'The Psalm of Death' (1890), and 'The Wager' (1900); in fiction, 'Roland Blake' (1884); 'Far in the Forest' (1888); 'A Madeira Party' (1895); 'Hugh Wynne' (1897); 'The Adventures of François' (1899); 'The Autobiography of a Quack' (1900); 'Circumstance' (1901); 'Collected Poems' (1896); 'Memoir of Owen Jones' (1896); 'Constance Trescott' (1905).

Mitchell, Walter, American Protestant Episcopal clergyman: b. Nantucket, Mass., 22 Jan. 1826. He was graduated from Harvard in

1846 and admitted to the bar in 1849, but deciding to enter the Episcopal ministry, received ordination to the priesthood in 1860. He held many important charges and was for a time chaplain of Kenyon College, Gambier, Ohio, and has now retired from active service. He has published: 'Two Strings to His Bow'; 'Bryan Maurice'; etc.

Mitchell, William, American astronomer: b. Nantucket, Mass., 20 Dec. 1791; d. Poughkeepsie, N. Y., 19 April 1868. He taught for a time, became cashier of the Pacific bank in Nantucket, and made a long series of investigations in connection with the United States coast survey studies of the figure of the earth. Besides lecturing on astronomy in Boston and elsewhere, he contributed to the 'American Journal of Science,' and supplied time to whaling vessels. He was elected to the American Academy of Arts and Sciences.

Mitchell, S. Dak., city, county-seat of Davidson County; on two divisions of the Chicago, M. & St. P., and on the Chicago, St. P., M. & O. R.R.'s; southeast of the central part of the State and about 68 miles west by north of Sioux Falls. It was settled in 1879, and incorporated as a city in 1883. It is situated in an agricultural region in which wheat is one of the great crops, and considerable attention is given to raising stock for the eastern markets. The industrial establishments are railroad shops, machine shops, lumber and brick yards, stock-yards, a creamery, and grain elevators. Mitchell ships large quantities of wheat and live stock. The three banks have a combined capital of \$125,000. It is the seat of Dakota University, founded in 1885 under the auspices of the Methodist Episcopal Church, and it has good public and parish schools. There are nine church edifices. The government is administered under a general law charter of 1890, and is vested in a mayor who holds office two years, and a council of eight members, four of whom are elected each year. The waterworks are owned and operated by the city. Pop. (1910) 6,515.

C. W. DOWNNEY,

Editor 'Mitchell Daily Republican.'

Mitchill, mitch'l, Samuel Latham, American physician: b. North Hempstead, L. I., 20 Aug. 1764; d. New York 7 Sept. 1831. He was graduated M.D. at the university of Edinburgh in 1786, and in 1788 was a commissioner for treating with the Iroquois Indians for the purchase of land. In 1792 he was appointed professor of chemistry, natural history, and philosophy in Columbia College, where he first introduced the system of nomenclature invented by Lavoisier. In 1797 he founded with Dr. Edward Miller and Elihu H. Smith the quarterly 'Medical Repository,' of which he continued the editor for 16 years. It was the first scientific periodical published in the United States. In 1801 he became a representative in Congress, and in 1804 was chosen to the United States senate. At the expiration of his term of office he was again elected to the house of representatives. On the establishment of the college of physicians and surgeons he was appointed (1808) professor of natural history, becoming in 1820 professor of botany and materia medica. The institution in 1826 gave place to the Rutgers Medical School, of which Dr. Mitchill became vice-president. Though widely respected in his lifetime as a man

of extraordinary learning, he was occasionally the victim of the satirical wits of New York, and the poems of "Croaker & Co.," to which Fitz-Greene Halleck was a contributor, contain records of some of his eccentricities. He proposed to change the name of this country to "Fredonia," and wrote in 1804 "An Address to the Freddes, or People of the United States." He was one of the early supporters of Robert Fulton, whom he accompanied in 1807 in the first steamboat journey on the Hudson. He was the author of "Observations on the Absorbent Tubes of Animal Bodies" (1787); "Nomenclature of the New Chemistry" (1794); "Life, Exploits, and Precepts of Tammany, the famous Indian Chief," a half historical, half fanciful address before the Tammany Society of New York (1795); etc. Consult Francis, "Reminiscences of Samuel Latham Mitchill" (1859).

Mite, formerly a term applied to a very small coin worth about one mill. The name was used for a small coin current in Palestine in the time of Christ.

Mit'ford, Bertram, English novelist. He has had a varied career; since 1873 largely South African. Among his published works are: "Through the Zulu Country"; "The Gun Runner"; "The King's Assegni"; "The White Shield"; "The Sign of the Spider."

Mitford, mit'ford, Mary Russell, English writer: b. Alresford, Hampshire, England, 16 Dec. 1787; d. Swallowfield, near Reading, Berkshire, 10 Jan. 1855. Her education was obtained largely through her very wide reading. Her first published work was "Miscellaneous Poems" (1810). With the sketches "Our Village," descriptive of English rural life (first appeared in "Lady's Magazine" (1819); collected 1824, 1826, 1828, 1830, 1832). She may be said to have originated a branch of literature. Among her dramatic works, five in number, "Rienzi" (1828) was most successful; in America it became popular with Charlotte Cushman as Claudia. Included in her further writings are "Recollections of a Literary Life" (1852), and the works of fiction "Belford Regis" (1835) and "Atherton" (1854), the latter highly praised by Ruskin. Her correspondence (published 1870) has been by some ranked almost with her books. Consult the "Life" by L'Estrange (1870).

Mitford, William, English historian: b. London 10 Feb. 1744; d. Exbury 8 Feb. 1827. He was educated at Oxford, and obtained a commission in the Hampshire militia, of which he became colonel. His early fondness for Greek led him to the study of Greek historians, and he was induced, partly through the advice of Gibbon, a fellow officer in the same regiment, to undertake a "History of Greece." The 1st volume appeared in 1784; the 5th and last, bringing the narrative down to the death of Alexander the Great, in 1818. With considerable critical acumen and diligent research he elucidated many obscure points, and until the appearance of the works of Thirlwall and Grote, his history was considered of the highest authority. A strong prejudice against democracy leads him to speak of the Athenians as a horde of treacherous miscreants, of Demosthenes as a malignant demagogue, and of Philip as a perfect statesman and warrior. Mitford was professor of ancient history in the Royal Academy, and member of

Parliament for three boroughs in succession 1785-1818. Besides his principal work he published an "Essay on the Harmony of Language" (1774) and lesser works.

Mithan. See GAYAL.

Mithras, mith'ras, in ancient mythology, the sun, or the genius of the sun, which was worshipped as a deity by the Persians, and at a later period also in Rome. Mithras stands as a mediator between Ormuzd and the world. He is commonly represented as a handsome youth, wearing the Phrygian cap, tunic, and cloak, and kneeling on a bull, into whose throat he is plunging the sacrificial knife. The bull is at the same time attacked by a dog, a serpent, and a scorpion. In Germany many tokens of its former existence are still to be found, as the monuments at Hedernheim, near Frankfort-on-the-Main, and other places.

Mithridates (mith-ri-dá'tér) VI., surnamed EUPATOR, and also styled commonly THE GAZAR, king of Pontus: b. Sinope 134 a.c.; d. Panticaeum 63 a.c. He ruled from 121 a.c. until his death. He early entered on his career of conquest, which ultimately involved him in war with Rome. He subjugated the peoples on the northern shore of the Euxine (Black) Sea, attacked Cappadocia and Bithynia, and since these were allies of Rome, there encountered Roman opposition. After the death of Sulla, 78 a.c., Mithridates levied another army to expel the Romans from Asia. Being defeated by Lucullus, appointed consul 74 a.c., he was followed by the victorious Romans into his own states, and driven to seek a refuge in Armenia, then ruled by Tigranes, who refused to deliver him up. Here Mithridates raised a third great army, and in 67 a.c. completely defeated the Romans; and, following up his success, rapidly recovered the larger part of his dominions. The Romans now invested Pompey with absolute power in the East, and by him, in 66 a.c., the forces of Mithridates were completely routed near the Euphrates. The king retired to Bosphorus (the Crimea), where his troops, headed by his son Pharnaces, broke out in mutiny, and Mithridates killed himself. He was considered by Rome its most formidable enemy. He was a patron of art and science, and is said to have spoken 22 languages. See POMPEY; SULLA.

Mitla, mêt'lá, Mexico, a village of the state of Oaxaca, on the Mixtecan plateau, 26 miles southeast of Oaxaca. It is celebrated for its extensive ancient ruins which comprise five great groups of temples, palaces, tombs and other edifices covering about 2,000 feet square and respectively known as (1) The Catholic establishment; (2) the Columns; (3) the Arrows; (4) the Adobe; and (5) the South Side. They were elaborately decorated with admirable mosaic work in geometrical designs, and with pictographic mural paintings. The ruins of a sort of the same architecture dominate a hill a short distance west of the city, and in the vicinity are the quarries whence the stone for building the city was obtained. See MEXICAN ARCHAEOLOGY. Consult: Saville, "Cruciform Structures near Mitla" (1900).

Mito, mêt'ô, Japan, a town in the island of Honshu, 7 miles from the east coast and 65 miles by rail northeast of Tokyo. It is a town of considerable antiquity and has played an im-

portant part in the history of the country. There is an old castle, now used for an educational institution, and some fine public gardens. The manufactures include cloth, paper, cigarettes, etc. Pop. about 35,000.

Mito, or **Mytho**, French Indo-China. See **MYTHO**.

Mitosis, or **Karyokinesis**, the process of indirect nuclear division of cells undergoing growth or beginning those changes in the egg which bring about the growth of an embryo. This is almost universal, but "amitosis," or direct cell-division occurs in pathological tissues and a few of the lowest organisms. The first stages are characterized by a rearrangement of the nuclear network into a series of loops or V-shaped bodies. Meanwhile a minute body in the cytoplasm, or extra-nuclear cell-contents, has divided into two, and the portions have arranged themselves at opposite poles, with the nucleus between them. Each of the two portions forms a star-like aggregation consisting of a centrosome with a radiating mass. The V-shaped bodies, or chromosomes, of the nucleus arrange themselves with their open ends outward and their closed ends near the centre, and they then separate along the central or equatorial plane, one-half proceeding to each centrosome, with whose rays it becomes incorporated and is firmly held. The cell then becomes constricted between the centrosomes, and in each of the two portions a new nucleus is developed by a process essentially the reverse of that just described. The final result is the formation of two daughter-cells out of the original mother-cell, each of which contains an exact half of the essential chromatin elements not only in respect to equal quantities, but in respect to those qualities, chemical or other, which constitute the inheritable individuality of the organism. For fuller information see **CELL**; **EMBRYOLOGY**; and consult the authorities cited under those titles.

Mitrailleuse, Fr. mē-trā-llē-z. See **OSMANCE**.

Mitral Valve. See **HEART, THE**.

Mitra, Bartolomé, bār-tō-lō-mā' mē-trā, Argentine soldier, politician, and author: b. Buenos Ayres 26 June 1821; d. there 19 Jan. 1906. He was the leader in the movement in which Buenos Ayres proclaimed itself independent 11 Sept. 1852, and was successively minister of the interior and of war in the Buenos Ayres government. The force commanded by him was defeated by Urquiza at Capeda 23 Oct. 1859, and Buenos Ayres was reunited with the Argentine Confederation. In May 1860 he was elected governor of Buenos Ayres. New troubles with the Confederation arose, and he defeated Urquiza at Pavón 11 Sept. 1861. In 1862 he was elected president of the New Argentine Republic to serve for 6 years, and after a very prosperous administration became minister to Brazil. His chief works are: 'Historia de Belgrano' (1857); and 'Historia de San Martín' (1884), of which there is an abridged English translation (1893).

Mitre, in ecclesiastics, a sacerdotal ornament worn on the head by bishops and other church dignitaries on solemn occasions, being a sort of cap pointed and cleft at top. There has been much controversy regarding the date at which the mitre became part of the official dress of bishops. Some have contended that the early

Christian church adopted with little change the head-dress of the Jewish priests. Three kinds are worn in the Roman Catholic Church, namely, the precious mitre, of gold or silver and ornamented with jewels; the *mitra auriphyrgiata* of gold cloth, without jewels (except pearls); and *mitra simplex* or plain mitre, of white silk or linen. Bishops and mitred abbots receive their mitres from the bishop who consecrates them. The Greek Church has no mitre. Since the Reformation the mitre has rarely formed a part of the costume of an English Church dignitary, but some bishops have worn it in quite recent times.

Mitre-shell, the shell of a gastropod mollusk of the genus *Mitra* and family *Mitridae*, closely allied to the *Meridae*, so called because of its resemblance in form to a bishop's mitre. The shells are thick, somewhat fusiform, with the spire very high and acute, and a small aperture and operculum. The genus is a very large one, comprising several hundred species mostly from shallow, tropical seas, and especially abundant in the Malayan region. *Mitra episcopalis* is abundant on the tidal flats of the Philippine Islands. During the day, especially at low water, they burrow beneath stones or hide in crevices, but are active at night. They secrete a purple fluid having a nauseating odor, and act as scavengers. Consult Cooke, 'Cambridge Natural History,' Vol. I. (1895).

Mitsui, mēt-soo'ē, a name which has in Oriental financial circles a prestige similar to that of Rothschild in those of the West. The mercantile house of Mitsui and Co. was established by Takatoshi (1633-1706), and has been identified with almost every large concern of industrial and economic interest in Japan.

Mitylene, mī-i-lē-nē, **Mytilene**, or **Lesbos**, a historic island of the Aegean Archipelago, off the northwest coast of Asia Minor, since 1462 belonging to Turkey, and called by them *Midilli*, while the Greeks generally call it *Mitilini* or *Mytilene*, from its capital. In shape it is nearly triangular, but on the south there are two deep and nearly land-locked bays; it has an area of 675 square miles, and a population (1904) of about 125,000. It is mountainous, but fertile, and is one of the finest islands of the Archipelago. The cultivated fruits include the olive, vine, fig, orange, pomegranate, apricot, pear, and apple. The olive is the most important crop, large quantities of oil being produced. Wine, for which the island was anciently famous, is still made, but after antiquated methods. The chief exports are oil, hides, wool, valonia, and fruits. There is excellent marble, deposits of iron, copper, alum, etc., and thermal springs utilized in the cure of rheumatism and nervous diseases. There are some tanneries, soap-works, numerous oil-mills, earthenware works, etc. The island anciently known as *Lesbos* was famous as a centre of Greek life and civilization. It formerly contained six cities, by far the most important being *Mitylene* and *Methymna*. It was early inhabited by Greeks of the *Æolian* race. Its inhabitants made an active resistance to the Persians, but were finally obliged to submit (about 540 B.C.). After the defeat of the Persians by the Greeks at the battle of Mycale (499 B.C.) it became the ally of Athens. During the Peloponnesian war it revolted from Athens, whereupon an Athenian

fleet was sent against it, the walls of Mitylene were demolished, and a thousand of the richest inhabitants put to death. The island itself was divided into 3,000 parts, of which 300 were devoted to the service of the gods, and the rest divided among the Athenians, by whom they were rented to the ancient proprietors. The cities, nevertheless, soon rebelled again. Alexander the Great made a treaty with the Lesbians after the battle of Granicus, and the island was afterward reduced by the Macedonians, and subsequently became part of the Roman province of Asia. It was placed by Constantine in the *Provincia Insularum*. In 1462 A.D., after belonging to a Genoese family, the island was taken by Mohammed II. During the War of Independence, the Turkish and Greek squadrons fought a battle off Mitylene 7 Oct. 1824, on which occasion the Turks were defeated and their fleet was destroyed. In consequence of strained relations between France and Turkey, a French fleet was sent to Mitylene 5 Nov. 1901; and remained there till the Porte agreed in full to the demands made. The Lesbians in ancient times were notorious for their dissolute manners, and the whole island was regarded as the abode of pleasure and licentiousness. At the same time they had the reputation of the highest refinement, and of the most distinguished intellectual cultivation. Poetry and music made great progress there. The Lesbian school of music was celebrated, and is said to have produced musicians superior to all the other musicians of Greece. Among these the most distinguished were Arion of Methymna, and Terpander of Antissa. Alcaeus and Sappho, both Lesbians, were esteemed the first in lyric poetry. Pittacus (one of the seven wise men), the philosopher Theophrastus and Theophrastus (the bosom friend of the great Pompey), and the historians Hellenicus, Myrtillus, etc., were also natives of this island. It was often chosen as a place of residence by distinguished foreigners. Epicurus and Aristotle taught there.

Mivart, miv'art, Saint George Jackson, English naturalist: b. London 30 Nov. 1827, d. there 1 April 1900. He was educated at Harrow and King's College, London. Having joined the Roman Catholic Church in his 17th year, he therefore received his academic training in St. Mary's College, Oscott. In 1851 he was called to the bar at Lincoln's Inn, but the possession of ample means enabled him to gratify his taste for natural history. He was appointed lecturer on zoology in St. Mary's Hospital Medical School in 1862, and from 1874 till 1884 was professor of biology in the Roman Catholic University College at Kensington. On the invitation of the Belgian bishops he accepted, in 1890, the chair of the philosophy of natural history in the university of Louvain. Elected a fellow of the Royal Society in 1867, he was vice-president of the Zoological Society in 1869 and 1872, secretary of the Linnean Society 1874-80 and its vice-president on two occasions (1880 and 1892). Dr. Mivart contributed a large number of papers to the leading reviews and to the proceedings of the learned societies with which he was associated, among the chief being those on 'The Structure of the Fins of Fishes,' 'The Osteology of Birds,' 'The Zoology, Anatomy, and Classification of Apes and Lemurs,' and his 'Memoir of the Insectivora.' He also published several important works on natural his-

tory subjects and the philosophical questions arising out of them. His best-known work is 'The Genesis of Species' (1871), in which, while fully admitting organic (though not mental) evolution, he argues against Darwin's theory of natural selection and attempts to explain the production of new species as due to an innate plastic power. Among his other works may be enumerated: 'Elementary Lessons in Anatomy' (1872); 'Man and Apes' (1873); 'The Common Frog' (1874, new ed. 1881); 'Lessons from Nature' (1876); 'Contemporary Evolution' (1876); 'The Cat' (1881), a good introduction to the study of the vertebrate animals, especially the mammals; 'Nature and Thought' (1883), 'A Philosophical Catechism' (1884); 'On Truth A Systematic Inquiry' (1889), in which he discusses the ultimate basis of science; 'The Origin of Human Reason' (1889), in which he insists on the fundamental distinction between man and all other animals; 'Monograph of the Canidae' (1890); 'Birds: The Elements of Ornithology' (1892), a useful introduction; 'Essays and Criticisms' (1892); 'Types of Animal Life' (1893), all vertebrate and mainly mammalian; an 'Introduction to the Elements of Science' (1894). The articles in the 9th edition of the 'Encyclopædia Britannica' on Apes, Reptilia (Anatomy), and Skeleton were from Mivart's pen. He published anonymously a novel, 'Henry Standon,' republished shortly after his death under the title 'Castle and Manor.' Mivart's contributions to the study of the vertebrate animals, though not of epoch-making importance, were always valuable and luminous. In the latter part of 1899 and the beginning of 1900 he expressed himself with considerable freedom regarding certain doctrines of the Roman Catholic Church, and on his refusal to sign a declaration of faith submitted to him was inhibited by Cardinal Vaughan from taking the sacraments of the Church.

Mixed Marriages, a name applied to marriages between persons of different religions. In the United States the term generally refers to a marriage between a Roman Catholic and a Protestant. In England a marriage between a baptized and an unbaptized person is ecclesiastically invalid, one between a member of the Catholic Church and of any other Christian communion is valid, but illicit, unless a dispensation is first obtained. If a Roman Catholic and a Protestant desire to marry, they must, according to Roman Catholic practice, promise that the children shall be brought up in the Roman communion; the bishop may then grant a dispensation and the marriage, without the nuptial benediction, must be performed by a Roman Catholic priest without any repetition of the ceremony by a Protestant clergyman.

Mixed Property. That which is not altogether real or personal, but a compound of both, such, for example, as heirlooms, tombstones, etc.

Mixosaurus, a genus of small fish-lizards (*Ichthyopterygia*) from the Triassic formations of Europe, differing from typical ichthyosaurs by their fewer teeth and some minor characters.

Mixtec, mēs-tāk', or Mixtec, a Mexican tribe of Indians of the Zapotecan stock occupying the coast of Guerrero. They are highly skilled in agriculture and the simpler arts, have built cities and temples of hewn stone, and

MIZPAH—MOABITE STONE

possess a hieroglyphic literature, keeping a calendar like the Aztec tribes. They are noted for their pottery and woven products.

Mizpah, miz'pa, or **Mispeh**, the name of several places in Palestine. The word signifies a high place, or lookout. Mizpeh of Gilead (Gen. xxxi. 29) is still pointed out with its group of rough stone monuments in the village of Sül. — The Mizpeh of Benjamin (Josh. xviii. 26, etc.) lay north of Jerusalem on an unknown site. — That of Judah (Josh. xv. 38) stood in the low hills northeast of Lachish. Nothing is positively known of the Mizpeh of Moab (1 Sam. xii 3).

Mjøsen, myt'sën, **Lake**, Norway, situated in a picturesque and fertile valley, 36 miles northeast of Christiania, is the largest lake in the country. It is 62 miles long, with a maximum breadth of 10 and an average breadth of two miles. It is exceptionally deep, having a maximum depth of 1,460 feet. It is fed by the Lagen River and drains into the Glommen through the Vorma. There are numerous popular summer resorts on its shores.

Mnemonics, a system of artificial aids for assisting the memory. Such methods have been in use for many years. They consist in the main of some mechanical scheme or framework which, by association, is linked with what one desires to memorize. One of the oldest forms of verbal mnemonics is contained in the familiar lines, "Thirty days hath September, April, June and November," etc.; and many similar devices are known. The medical student has an unlimited number of mnemonic aids whereby to remember the names of the muscles, to call to mind the relations of important viscera, and to determine accurately the order of the cranial nerves. Students of logic have for years made use of mnemotechnic devices to remember the parts of the syllogism. (See **Logic**.) Some of these devices are based on topical association, whereas others depend on number and letter relations, and a great many which have been in vogue in recent years are based upon sound and rhyme relations. A general criticism that can be made of most of these memory-schemes is that the processes are purely mechanical, and that one of the fundamental features in memory, that is, memorizing for the sake of idea-relation, is given up for the sake of word-relation. For certain classes of students and for certain lines of work these mechanical schemes may be of much service; for salesmen, for instance, who need to bear in mind immense quantities of goods with their wholesale, retail, and discount prices. But as a process of general culture, improving mind-facilities, so called, mnemotechnics are mechanical. See **Memory**.

Mnemosyne, mē-mōs'ī-nē, in Greek mythology, the mother of the nine muses of Zeus. She was a daughter of Uranus.

Mo'a, one of a race of extinct ratite flightless birds of New Zealand, forming the family *Dinornithidae* and composed of several genera (see *DINORNITHES*) ranked between the apteryx and the emu. They had comparatively small heads, small eyes, bills of varied form, great legs, wings almost or quite wanting and the head and neck bare. The feathers of the body were rounded, loose in part downy, with great after-shafts. Some of the feathers were black with

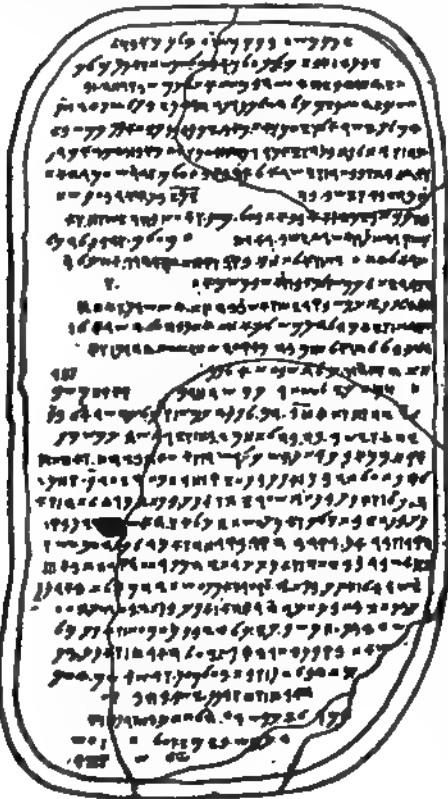

red-brown bases and white, others blackish brown or yellowish. They varied in size from that of a turkey (*Anomalopteryx parva*) to that of the huge *Dinornis maximus*, 12 feet in height. The remains of these birds are found in sand-dunes, bogs, caves and places where the aborigines had fed upon their flesh. Not only bones, but pieces of skin, ligaments, feathers and eggs have been recovered. It is probable, indeed, that these birds became extinct only four or five centuries ago. The Maori traditions recount the wars of extermination which their early ancestors waged with the moa; and the natives profess to show the spot where the last one was killed. Clearer traditions say that the habits of the birds were sluggish, but their disposition fierce. They lived in pairs, fed upon green shoots and fern-roots and made rude nests on the ground. Their anatomy was elaborately described in a memoir by Owen, 'Extinct Birds of New Zealand' (London, 1879), and a general account of them may be found in Newton's 'Dictionary of Birds' (1896).

Moab, mō'āb, the ancestor of a Semitic people who occupied a region east of the Dead Sea and the Jordan from an early period till the Christian era. In the Old Testament (Gen. xix. 37) he is said to be the son of Lot by his elder daughter. The "plains of Moab" spoken of in Numbers are the hot plains of the Jordan Valley. The region to which the Moabites were confined by the Amorites was strongly fortified on every side by nature, and was noted for its rich pastures and its wine. The institution of monarchy was of much earlier introduction among the Moabites than among the Israelites, but the religion of Moab seems to have been very similar to that of their more celebrated neighbors and kinsfolk. Their supreme god was Chemosh, who held among them much the same position as Jehovah among the Israelites, and they seem to have had something akin to the priesthood and general theocratic organization of the Israelites. The Moabites were harassed by the Assyrians, but at one period they assisted the latter against the Jews. Moab is mentioned about the 6th century A.D., but the people, as distinct from their neighbors, have long passed out of existence. The extensive ruins which now cover their country bear witness to their former greatness. The language of Moab was closely akin to that of Israel.

Mo'abite Stone, in archaeology, a monument of black basalt, about 3 feet 8½ inches high, and 2 feet 3½ inches wide, and 1 foot 1¾ inches thick, with rounded top but square base, on which there is an inscription of 34 lines in Hebrew-Phœnician characters, discovered in 1868 by F. A. Klein at Dhiban in the ancient Moab, just north of the river Arnon. An attempt made to purchase it led to a quarrel among the Arabs of the district, and the stone was destroyed partially by being heated and then by throwing water upon it, which caused it to break into three large and several small pieces. The larger pieces were secured for the Louvre by M. Clermont-Ganneau, an official connected with the French embassy at Constantinople, who was also fortunate in obtaining a paper impression of the inscription before the stone was broken. The inscription dates about 900 A.C., and is the oldest known in the Hebrew-Phœnician form of writing. It was erected by

MOALLAKAT—MOBILE

Mesha, king of Moab, and is a record of his wars with Omri, king of Israel, and his successors. The narrative also treats of Mesha's wars against the Edomites. Consult Ginsburg, 'The Moabite Stone' (1870).

The Moabite Stone.

Moallakat, mò-ál-lā-kāt'. See ARABIA, *Literature*.

Moaria, in geology, a name applied by Mantell to a hypothetical southern continent, the home of the moa. The supposition is that New Zealand, Chatham, Philip and the Auckland islands, and other Polynesian islands are the remains of this submerged continent. The assumption of the existence of such a continent, as is the case with Lemuria (q.v.), is for the purpose of explaining the distribution of the species.

Moawiah, mò-ā-we'yā. See CALIFE.

Mobangi, mò-bāng'gē. See UBANGI.

Moberly, mò-bér-lī, Mo., city, in Randolph County; on the Wabash and the Missouri, K. & T. R.R.'s; about 125 miles northwest of St. Louis. It is an agricultural region, and in the vicinity are valuable deposits of fire-clay, and also extensive coal fields. Some of its industrial establishments are the machine-shops of the Wabash Railroad, flour and lumber mills, ice factory, grain elevator, foundry and machine-shops, brick and lumber yards. The trade is chiefly in live-stock, poultry, wool, tobacco, dairy products, hides, and the local manufactures. It is the seat of St. Mary's Academy, and has public and parish schools and a public

library. It has also a Young Men's Christian Association building. Pop. (1890) 8,215; (1900) 8,012; (1910) 10,923.

Mobile, mò-bél', Ala., city, seaport, county-seat of Mobile County; on the Mobile River at its entrance into Mobile Bay, 33 miles from the Gulf of Mexico; 141 miles by rail from New Orleans, 180 from Montgomery, 104 from Pensacola. It is on the Southern, Louisville & Nashville, Mobile & Ohio, Mobile & Bay Shore, and Mobile, Jackson & Kansas City R.R.'s. Commercially and historically, Mobile is one of the most important and interesting cities of the South. It is one of the leading cotton markets and shipping points of the country, the natural centre of the Alabama-Tombigbee cotton region. A semi-weekly line of large freight steamers plies up the Alabama to Montgomery, 410 miles, and to Demopolis, at junction of Tombigbee and Warrior rivers, and smaller vessels ascend the Warrior to Tuscaloosa, and at high water to Columbus on the main stream, navigable the year round. The exports include cotton, cottonseed-oil, fruits, coal, lumber, live stock, meat, tar, turpentine, and rosin, etc.—a total of over \$12,000,000 a year. The exports for the year ending 1 Sept. 1903, were \$12,600,000, and the imports \$4,170,000, largely tropical fruits, coffee and sisal. There are manufactures of great diversity with a product in 1909 of about \$5,429,000, and employing 2,719 persons. Headed by lumber and timber products from the Alabama forests, they comprised also grist milling, foundry and machine work, ship and boat building, shingles, boxes, barrels, baskets, cigars, confectionery, saddlery and harness, brooms and brushes, brick, baking and yeast powders, malt and distilled liquors, ice, etc.

Topography.—The city is built on a level sandy plain about 15 feet above the bay, rising gradually to low hills, and furnishing good drainage; the streets are mostly rectangular, broad and finely shaded. The "shell road," skirting the bay, and Government Street, are noted drives; and there are three parks, Washington, Bienville, and Monroe. Near by on the south and west are dry, sandy pine hills, agreeable retreats during the hot season; and across the bay in Baldwin County, called the eastern shore, are many summer resorts. The water supply is so pure that it is used for chemical purposes without filtering; it comes from two sources,—Spring Hill 5 miles distant, Clear Creek 11 miles. The sanitary condition of the city has vastly improved and the yellow fever, once a frequent visitor, has entirely disappeared. The death rate in 1900 was 25.9.

Public Buildings.—The chief structures are the government building, which cost \$250,000, the court-house, Cotton Exchange and Chamber of Commerce, the Masonic Temple, Odd Fellows' and Temperance Halls, the Battle House, Bienville Hotel, Athelstan Club and one of the best arranged markets in the south, the United States Marine Hospital, the city hospital, the Providence Infirmary, and the cathedral of the Immaculate Conception, and several handsome churches of different denominations. The United States court for the Southern District of Alabama has its seat here. The educational institutions include a splendid free school system which occupies the Barton Academy and other buildings in various parts of the city, the Col-

MOBILE—MOBILE BAY

lege of Saint Joseph, Spring Hill College a few miles west (Roman Catholic, 1830), McGill Institute, Evangelical Lutheran Institute, Convent and Academy of the Visitation, Medical College of Alabama (1859), Saint Mary's School, and three public libraries,—the Public, Mobile (subscription), and the Y. M. C. A.

There are three daily and several other newspapers. The mayor, a council, and a board of aldermen at large, are elected for three years; they form a General Council which elects the other officers. The assessed valuation in 1900 (basis of $\frac{1}{2}$) was about \$16,000,000; net debt \$822,000. Tax rate \$26.50 per \$1,000.

Trade and Commerce.—The fiscal year ending 30 June 1903, marked the banner year in Mobile's foreign trade, exceeding that of the previous record year, which ended June 1902, by over \$500,000, the total trade, imports and exports, for the 12 months of 1902-03 reaching the total of \$16,790,000.

The trade with Cuba, West Indies, and Central America continues large. The exports to those countries for fiscal year ending 30 June 1903 being nearly \$4,000,000, and the imports over \$5,000,000. It is noticeable in the export trade of Mobile that the increase in value of cotton and lumber exported in 1902-3 is \$1,534,000 over 1901-2.

The export and import trade of Mobile in 1893-4 was \$3,475,803; in 1902-3 was \$16,790,000, an increase of nearly 500 per cent in 10 years.

In 1888 Mobile had but 17 feet of water in the channel from the lower bay to the city. In that year the government began the project of deepening the channel to 23 feet; this was completed to 22 feet in 1901, and to 23 feet in 1903.

There is now 24 feet of water on the outer bar at the entrance to Mobile Bay, which will be deepened to 30 feet by July 1904. There is from 30 to 40 feet of water in the lower bay, which is a safe, land-locked harbor. There is no record of any vessel having been lost by storm in Mobile Bay or harbor.

Mobile is the third largest importer of tropical fruit in the United States. Its vegetable and truck farming interest is also very large. Its fish and oyster business is of much importance and increasing all the time.

Mobile's timber trade is very large, the mills in the territory having a capacity of 1,200,000,000 feet yearly, which is exported through this port to every port of the world.

History.—Mobile Bay was the original seat of French colonization in the Louisiana territory. Iberville founded a temporary settlement at Biloxi in 1699 and in 1702 he removed it to the Mobile River 27 miles above the bay, where occurred the famous "petticoat insurrection" of the women against too much corn-meal diet. A monument was erected there on the bicentennial of Mobile's foundation. In 1711 a hurricane and flood nearly destroyed the place, and the settlement was removed to the present site. It remained the capital till 1722, when New Orleans was given that position. In 1763 Mobile passed into British hands, and they changed the name of its Fort Condé to Fort Charlotte; in 1780 the Spanish general Galvez captured it, and it was confirmed to Spain by the treaty of 1783. On 13 April 1813 it was captured by the American Gen. Wilkinson; Fort Bowyer at the mouth of the bay was

retaken by the British, but again given up. It was incorporated as a town 20 Jan. 1814, as a city 17 Dec. 1819. In 1818 the Bank of Mobile was founded, which in the panic of 1837 was one of the only four United States banks which did not suspend; the same year (1818) steamboats were operated on the rivers. In 1839 it was nearly destroyed by fire and ravaged by yellow fever, again in 1852 by flood and fever. On 4 Jan. 1861 the State authorities took possession of Forts Morgan and Gaines in the harbor, though the State did not secede till the 11th. Mobile is the only American city which has been under five sovereignties. In August 1864 Farragut entered the harbor past the fire of the forts, amid mines and torpedoes, and after a heroic battle destroyed or captured the Confederate fleet including the ram Tennessee, and in co-operation with Gen. Gordon Granger captured the forts. The city was not taken until 1865, just before the surrender. The government afterward carried on great improvement works in the harbor, deepening its 13 feet of channel to 21 feet. Owing to Reconstruction finance, the city became bankrupt, and on 11 Feb. 1879 its charter was canceled and the name changed to Port of Mobile; on 10 Dec. 1886 a new charter was given and the old name restored.

Population.—(1785) 746; (1813) about 500; (1820) 1,500; (1830) 3,194; (1840) 12,672; (1850) 20,515; (1860) 29,258; (1870) 32,034; (1880) 29,132; (1890) 31,076; (1900) 38,469, of whom 17,067 were colored; (1910) 51,521; including the suburbs, about 63,000.

L. F. IRWIN,

Secretary Mobile Chamber of Commerce.

Mobile, a bay on the southeast coast of Alabama, which is really the estuary of the Tombigbee and the Alabama rivers. That part of the estuary to which the name of Mobile Bay is applied is about 30 miles long and from 9 to 12 miles wide. At the entrance to the bay are long narrow strips of land, almost obstructing the entrance. On the east, at Mobile Point, is a revolving light; on the west, on Dauphin Island, are Forts Morgan and Gaines. Between Dauphin and the mainland is Grant's Pass, a strait connecting Mobile Bay with Mississippi Sound. The United States government has improved the harbor, and from a shallow entrance, which was a hindrance to navigation, there is now a channel through which vessels drawing 23 feet and over can enter, and vessels drawing 17 to 23 feet can ascend to the wharves of the city.

Mobile, a river in Alabama, the name given to the western stream or mouth of the river formed by the junction of the Alabama and Tombigbee rivers. The eastern stream or mouth is called the Tensas. From the junction of the rivers to the head of Mobile Bay is, in direct line, about 25 miles, but the winding of the stream makes its course about 50 miles long. The Mobile and Tensas communicate at several points, but the two streams enter the Mobile Bay at the city of Mobile, by the same delta.

Mobile Bay, Battle of, a battle of the Civil War fought 5 Aug. 1864. Mobile Bay is divided from the Gulf of Mexico by Mobile Point east and Dauphin Island west, about three miles apart; but the ship-channel of less than 2,000 yards, narrowing to 750 outside, closely skirts Mobile Point. The latter was defended

BIENVILLE SQUARE, MOBILE.

MOBILIAN TRADE LANGUAGE — MOCKING-BIRD

by Fort Morgan; the island by Fort Gaines, too far from the channel to be very formidable. Between them stretched a line of piles and torpedoes, but leaving a narrow channel for blockade-runners, marked off by a red buoy. Within was the Confederacy's most powerful ram, the Tennessee, and three small unarmored paddle-wheel gunboats. Farragut's Federal fleet (in order of battle) comprised the monitors Tecumseh, Manhattan, Winnebago, and Chickasaw, forming an inshore column; and the wooden sloops of war Brooklyn, Hartford (flagship), Richmond, Lackawanna, Monongahela, Ossipee, and Oneida, forming an outer one, each with a smaller mate lashed to the port side, to insure passage through if the starboard vessel's machinery should be disabled. Farragut would have led in the Hartford, but the Brooklyn had machinery for picking up torpedoes. The advance began at 5:30 A.M., and firing at 7:05; the instructions were to keep east of the red buoy, but the Tecumseh went west and was sunk by a torpedo. The Brooklyn stopped in fear of a like disaster, and the Hartford with Farragut passed her and led the fleet into the bay. Each vessel received much damage from Fort Morgan, but they silenced its guns by destructive fire, and all succeeded in anchoring three miles up. One Confederate gunboat was then sunk, one captured, and one took refuge next the fort; the Tennessee was to be attacked after dark, but itself assailed the flagship, and after a desperate fight was disabled and surrendered. The Lackawanna collided with the Hartford and nearly sunk her. The Union fleet lost 52 killed, 170 wounded, and 113 drowned in the Tecumseh; the Confederates 10 killed, 16 wounded, and 260 prisoners, besides the casualties in the fort. Both forts surrendered a few days later. The Union fleet carried 159 guns, and the officers and crews numbered 3,000 men. The Confederate fleet carried 23 guns and 470 officers and men.

JOSEPH T. DIXON,
Author of 'History of Georgia.'

Mobilian Trade Language, an Indian jargon, used in the Gulf States and Northwest. It is based upon Choctaw, with additions from numerous other dialects. The early French colonists called it *Mobilienne*, from the city of Mobile, which was formerly a great trading centre of the Gulf region. The language was spoken in Louisiana as late as 1850.

Mobilier, Cr dit. See CREDIT MOBILIER.

Mocassin, Moccason, Mocassin, or Mocassin, originally a deerskin sandal, the sole and upper of which are formed of one piece of leather. It was formerly the ordinary foot-covering worn by the North American Indians. In recent times fancy moccasins are made for the general shoe trade, all kinds of leather being utilized for the purpose.

Mocassin-flower, a name for the American orchids (q.v.) of the genus *Cypripedium*, especially the large pink *C. acule*, given to them by the Indians in allusion to the shape of the inferior part of the flower. Lady's-slipper is a common English name of the same import. See ORCHIDS.

Mocassin Snake, or Cotton-mouth, a large venomous serpent (*Ancistrodon piscivorus*) of the rattlesnake family, but having no rattles, the tail ending only in a horny spike, like that of

its near relative, the copperhead (q.v.), some times called "upland moccasin." It inhabits river-banks, swamps, and fresh-water marshes throughout the southern half of the United States, swarming in some regions, like the Everglades of Florida, or the half-flooded woods of lower Louisiana, and constantly invading the rice-fields. Elsewhere it is not greatly to be feared, as it rarely leaves the edge of the water, where it is fond of lying upon some low overhanging bush or floating log, ready to drop upon the fishes and frogs, which form its principal food, and which it pursues with great speed in and under the water. It often reaches a length of four feet, and its bite is deadly, the widely opened mouth in the act of striking showing cottony white. Its color is a dark reddish brown, obscurely marked with blackish, and with white blotches on the lips and abdomen. Eight or ten young are produced annually, viviparously; and these are frequently captured, but never yield any of their native sullen ferocity. One of the most complete biographies of this snake is that by Stejneger in the 'Annual Report' of the Smithsonian Institution for 1893.

Mocha, m  k   (Arabian, m  m  ), or **Mokha**, Arabia, a fortified seaport, the former capital of Yemen, on the Red Sea, 130 miles northwest of Aden. During the 16th and 17th centuries Mocha was the chief port and emporium from which the coffee of Yemen was exported, whence the proverbial term, "Mocha coffee." The trade has been diverted to Hodeida and Aden. Pop. about 4,800.

Mock Orange, a name applied in England to the *Syringa* (q.v.), and in the United States to the *Prunus caroliniana*, a small evergreen resembling the cherry-laurel.

Mocker-nut, a species of hickory (q.v.).

Mocking-bird, a familiar and celebrated songster of the southern part of the United States (*Mimus polyglottus*), representing a genus of thrush-like wrens, many other species of which are known in Mexico, Central America, and West Indies. The plumage of all is bluish-gray and white, with no striking ornaments but much elegance of outline and tint. Their habits differ little from those of thrushes and other migratory, insect-eating birds, but they show great courage in defending their nest, placed usually in a bush or small tree, against cats, snakes, and similar enemies. The young, when taken from the nest for domestication, should be removed at an early period; or if taken later, they are generally removed by means of trap-door cages. The ordinary song notes of the mocking-birds are clear, bold and varied. They sang during the night, like the nightingales, and appear to begin their song with the rising moon. The imitative notes of these birds are, however, still more varied than their natural tones. They mimic with success the songs of their feathered neighbors, and with such exactitude as to deceive the ear of the most experienced sportsman. When they are kept in confinement all the sounds of the household, as well as the mewing of cats, the barking of dogs, the cry of an injured chicken, and the screech of the hawk, are all exactly imitated. They are hardy and require only ordinary care and attention to live contentedly for many years in any moderate climate. The mountain mocking-bird (*Oreoscoptes montanus*) of the Rocky Mountain re-

MOCKLER-FERRYMAN—MODE

gion; and the various "thrashers" (q.v.) are relatives not greatly inferior in song; while the mocking-wren (see *WREN*) is a more distant relative highly gifted in imitative powers.

Mockler-Ferryman, Augustus, English military expert and author: b. Ireland 1856. He was educated at Cheltenham College and Sandhurst; entered the army in 1876; was instructor in fortification (1892-7) and in military topography (1897-1900) at Sandhurst, where he became professor of the latter subject in 1900. He has published 'Up the Niger, Narrative of Maj. Claude Macdonald's Mission' (1892); 'In the Northman's Land' (1896); 'British West Africa' (1898); 'Annals of Sandhurst' (1900); 'British Nigeria' (1902); technical articles, etc.

Mod'der, or Kaiba, River, South Africa, a tributary of the Vaal River, joining the latter about 30 miles above its confluence with the Orange River. It has an eastward course of over 180 miles. It came into considerable prominence during the Boer war of 1899-1902; along its banks at Maagersfontein the British were driven back with great loss in 1899, and at Paardeberg, the Boer general Cronje surrendered in 1900.

Mode, in music, (1) the manner of arranging the tones and half-tones in a scale, this general designation being always accompanied by a qualifying adjective, as Dorian mode, minor mode. Greek music, from which our modern music has been evolved, had an elaborate system of nine modes, which were afterward extended to fifteen. Authorities vary considerably as to the differences between the modes; it is certain, however, that they were the outgrowth of an earlier Greek music, the basis of which was the tetrachord. A tetrachord is a short scale of four notes, one of the intervals being a half-tone and the others whole tones, for example:

(A) Dorian tetrachord, half-tone, $\frac{1}{2}$; (B) Phrygian tetrachord, half-tone, $\frac{1}{2}$; (C) Lydian tetrachord, half-tone, $\frac{1}{2}$.

The slur indicates the half-tone.

The tetrachords were probably named after the people that originated them.

Until the time of Terpander (7th century B.C.) all Greek music seems to have been confined to the limits of a tetrachord. The lyre, which was then used merely to give the singer the pitch, had but four strings, each capable of sounding but one note. It was tuned in one of the ways shown above, though the notes written should be understood to be merely relative, each singer tuning his lyre to suit his own voice.

Terpander increased the compass of the lyre by adding a second tetrachord to the first, using the highest note of the first for the lowest of the second, thus making an incomplete scale of seven notes.

Terpander's Seven Note System.

The middle note, A, belonging to both tetrachords, was called *Mese* (middle) and had

somewhat the function of our modern keynote. It will be noted that the two tetrachords are both Dorian, which was the characteristic and favorite Greek tetrachord rather than the foreign Phrygian or Lydian.

Pythagoras (582 B.C.) is the reputed author of the octave system (the foundation of our modern system). He probably learned it during his visit to Egypt, where it is said to have been in use for many centuries before. By this system the two tetrachords, instead of having a note in common, were separated by a whole tone, called the diazeutic tone or tone of disjunction.

Pythagoras' Octave System.

A was still the keynote or *Mese*, though no longer the middle or connecting note. Terpander's was called the conjunct system and Pythagoras' the disjunct system. The latter as above printed constituted the Dorian mode, which may be defined as two Dorian tetrachords separated by the diazeutic tone, embracing the compass of an octave. Terpander's system not having this compass, cannot strictly be called a mode. Music seems to have developed on both these systems simultaneously in Greece, though finally that of Pythagoras supplanted Terpander's and became universal.

By replacing the two Dorian tetrachords with two Phrygian or two Lydian the modes of the same name were formed.

Lydian Mode.

These three were the principal modes. Each had two auxiliary modes, one commencing a fourth below and distinguished by the prefix *hypo*, the other commencing a fourth above with the prefix *hyper*. The complete list of the nine original modes is as follows:

- I. Dorian.
- II. Phrygian.
- III. Lydian.
- IV. Hypodorian or Æolian.
- V. Hypophrygian, Ionian or Iastian.
- VI. Hypolydian.
- VII. Hyperdorian or Mixolydian.
- VIII. Hyperphrygian or Locrian.
- IX. Hyperlydian.

A convenient way to remember them is to imagine a series of scales, all of natural notes, and an octave in compass, beginning on each of the seven natural notes. It should be remembered that the pitch is entirely relative; each of these modes might begin on the same actual sound. The *Mese* or Keynote is the fourth note of each scale.

On examination it will be seen that the three Dorian modes are each formed of two Dorian tetrachords, the three Phrygian modes of two Phrygian tetrachords, and the three Lydian

1. Motmot.
2. Mother Carey's Chicken.

3. Mouse-bird.
4. American Mockingbird.

MODE

modes of two Lydian tetrachords. In the three principal modes the diazeuctic tone separates the tetrachords. In the hypo-modes it is the low-

est note and in the hyper modes it is the highest note. In all the hypo and hyper modes the tetrachords are conjunct like those of Terpander. It will be seen that two of the hypos correspond exactly with two hypers, namely, the hypophrygian and the hypodorian are the same as the hyperlydian and the hyperphrygian. It will be observed, however, that the arrangement of the tetrachords and the diazeuctic tone are not the same.

Each mode was said to have its characteristic quality or sentiment; the Dorian seems to have been the favorite one for heroic utterance, while the Lydian was said to be languishing and erotic.

The modes were afterward increased to fifteen, at least three of which were mere transpositions by octaves of earlier modes. In fact some theorists hold that the later development of the Greek modes completely changed their original significance and that instead of their being different arrangements of whole and half tones in a scale they were all identical in formation and were in fact merely Dorian modes of different pitch. If this is so they should not be called modes at all, but keys, as in modern music. The titles of the modes seem to contradict this theory, but the subject is so confused and the different theories so difficult of proof that wide differences of opinion will probably always exist. The complete list of the fifteen modes is as follows, the pitch given being said to be the accepted one for each mode (or key):

Fourths below	Originals	Fourths above
Hypodorian (A)	Dorian (D)	Hyperdorian or Mixolydian (G)
Hypoionian (Bb)	Ionian or Iastian (Eb)	Hyperionian (Ab)
Hypophrygian (B)	Phrygian (E)	Hyperphrygian or Locrian (A)
Hypoeolian (C)	Aeolian (F)	Hyperaeolian (Bb)
Hypolydian (C#)	Lydian (F#)	Hyperlydian (B)

The Greeks had in addition three kinds of chromatic modes and an enharmonic mode.

They were all modifications of one or both of the interior tones of the tetrachord, the outer tones of which were never allowed to change their relative pitch. These modes had no significance in the history of music and were not adopted by the Romans.

The following are examples of Pythagoras' original Dorian mode changed to (a) chromatic and (b) enharmonic:

The X is used to represent a sound one quarter of a tone higher than the one preceding it.

The Gregorian or ecclesiastical modes are based on the Greek modes, though many errors and changes of names were made in arranging the system. St. Ambrose, bishop of Milan, chose four of the ancient modes which he named Authentic. Gregory the Great is said to have added four others called Plagal. Six more were afterward added, making fourteen, two of which were declared imperfect and rejected. There are two kinds of Gregorian modes, the Authentic and the Plagal. The final or keynote of the authentic modes is the lowest note of its scale. Each authentic mode has an attending plagal mode, a fourth below it, the keynote of which is the same as that of the authentic mode. The plagal modes are therefore similar in this sense to the Greek modes, the fourth notes of which were said to be keynotes. The Gregorian modes are numbered, the authentic receiving the odd and the plagal the even numbers. In addition, the old Greek names are used, the plagal modes receiving the prefix hypo, but unfortunately the Gregorian and Greek titles do not correspond, causing great confusion in all references to the modes. Thus, the Gregorian Hypophrygian is the same as the Greek Hyperdorian, and the Gregorian Hypomixolydian with the Greek Phrygian.

As in the Greek modes it is convenient to remember the Gregorian modes by imagining a series of scales, all of natural notes and an octave in compass, beginning on each of the seven notes. These are the authentic modes from which the plagal with their prefix hypo can be readily counted. (It should be remembered that the pitch is entirely relative as in the Greek scales.)

The Gregorian modes are still in use in the Roman Catholic Church, to the services of which it adds a remarkable effect of antiquity and solemnity.

MODEL—MODENA

In modern music but two of the old modes remain; the major, equivalent to the Greek Hypophrygian (or Hyperlydian) and the Gregorian Ionian, and the minor, equivalent to the Greek Dorian and the Gregorian Æolian. The choice of these two modes took many centuries and must have been made by entirely unconscious perception of their greater value especially of that of the major scale. A comparison of the major scale with the favorite Dorian mode of the Greeks shows that the modern ear desires the half tone at the top of a tetrachord instead of the bottom, as they did. Whether the favor in which the Dorian tetrachord was held by the Greeks is a proof that they thought their music *downward* and were therefore doing just the same as we do when we think ours *upward* is very doubtful, though a well-known theorist has advanced this clever idea. It is much more likely that the introduction of harmony caused a greatly increased recognition of the true function of the keynote, which, as we understand it, was unknown to the ancients. To us the keynote (in any octave) is the only rest point to the ear; all other notes of the scale trend toward it more or less strongly, and in the instance of an ascending major scale the seventh note (the so-called leading note) demands it more than any other note. This quality of motion and rest led to the greater importance of the major mode over the minor, the seventh note of which, being a whole tone distant from the keynote, lacked the great desire to progress these which is so important a characteristic of the major. Finally, probably by accident at first, the seventh note of the minor was raised so as to be but a half tone below the keynote; this form of the minor key is now known as the "harmonic minor," and is the only one recognized in harmony.

But the distance from the sixth to the seventh being thus made a tone and a half, a very difficult interval to sing or treat melodically, the sixth was raised to secure a smoother and easier passage upward and as the double change had made the upper part of the minor mode identical with the major it was argued that neither leading note nor raised sixth was necessary in descending, so both were restored to their original position in descending. This is known as the "melodic minor."

(2) A term used in mediæval music to indicate the relative value of the *Large*, the *Long* and the *Breve*. Two kinds of mode existed, great and less, the first deciding the relation of the large to the long and the second that of the long to the breve. Both kinds could be perfect or imperfect. In great mode perfect the large is equal to three longs. In great mode imperfect it was worth but two longs. In less mode perfect the long was equal to three breves, in less mode imperfect it was equal to two breves.

During the end of the 15th century and the beginning of the 16th musicians made extraordinary difficulties in their compositions by means of mode and prolation.

GEORGE GORDON THUNDER.

Model, in art, an original of any kind proposed for copy or imitation. Models in imitation of any natural or artificial substance are usually made by means of molds of plaster of Paris. In painting this is the name given to a man or woman who is procured to exhibit him or herself in the requisite costume, or in a state of nudity, for the advantage of the students. These models are provided in all academies and schools for painting. In sculpture a model implies a figure made of clay, wax, plaster, or any other suitable substance, which the artist molds to guide him in fashioning his work as the painter first makes a sketch, or the architect a design.

Modena, mô'dè-nâ, Italy, a city and province, part of a former duchy now comprised partly in the compartimenti of Emilia and Tuscany.

The city, capital of the province, pleasantly situated in a fertile plain, between the Secchia and the Panaro, 25 miles northwest of Bologna, is built with great regularity, and has spacious streets, and fine promenades on the site of its former ramparts. It consists of three parts—the citadel, the old town, and the new town. The most remarkable edifices and establishments are the cathedral, a fine specimen of Romanesque, adorned in front with numerous curious sculptures; the Campanile, erected in 1224-1319, 335 feet high, and one of the finest in North Italy; the church of San Francisco, a handsome Gothic structure, containing a fine terracotta group of the Descent from the Cross, by Begarelli; several other churches; the ducal palace, begun in the 17th century, but enlarged by numerous modern additions, and forming a splendid structure, now used as a military school; the Albergo Arti or building containing the municipal collections, especially the Estense Library of over 150,000 works, including several thousand MSS., and the picture-gallery embracing a large collection of paintings, several of them by the first masters; the theatre, the baths, the university, several other important educational institutions, and charitable endowments. The manufactures consist chiefly of silk goods, silk twist, woollen and hempen cloths, leather, and glass; the trade, however, is unimportant. Modena is the see of an archbishop, and possesses various important public offices. It existed under the Etruscans, and as Mutina rose to great splendor under the Romans. It afterward was repeatedly sacked by the northern invaders, whose ravages left few vestiges of its ancient grandeur. Pop. (1901) 64,843.

The former duchy bordering on Tuscany, Lucca, Bologna, Mantua, and Parma, had an area of 2,573 square miles, which in 1901 contained a population of 785,930. It is now divided into the provinces of Modena and Reggio in the compartimento of Emilia, and the province of Massa e Carrara in the compartimento of Tuscany. Modena was made a duchy in 1453, the ruler being Duke Borso of the house of Este, to which noble family Modena had belonged since 1268. In 1796 the French took possession of the country and Modena afterward

MODERN ANALYTICAL GEOMETRY—MODJESKA

was included in the Cisalpine Republic. By the treaty of Vienna in 1815 it was restored to the Este family. The duchy took an important part in the turbulent proceedings of the 19th century, which led to the consolidation of the Italian kingdom in 1860, when Modena proper was formed into a separate province with an area of 1,002 square miles. Pop. about 325,000. See ITALY.

Modern Analytical Geometry. See GEOMETRY, MODERN ANALYTICAL.

Modern Athens, a euphemistic term for various modern seats of learning, chiefly applied to Edinburgh, Scotland, and Boston, Mass., each celebrated for schools of learning, literary output, and general culture.

Modern Instance, A, a novel by William Dean Howells, published in 1881. The scene of the story is first laid in a country town in Maine, where Bartley Hubbard, a vain, selfish, unprincipled young man, is editing the local paper. He marries Marcia Gaylord, an inexperienced country girl, and takes her to Boston, where he continues his journalistic career. As time goes on, the incompatibility of the young couple becomes manifest; Marcia's extreme jealousy, and Bartley's selfishness and dissipation, causing much unhappiness and contention. The novel can hardly be agreeable, but it shows that its author has seen very clearly into certain unattractive but characteristic phases of contemporary American life; and the story is told with brilliancy and vigor.

Modernism, Pope Pius X on. In a recent utterance, Pope Pius X enunciated the following doctrines,—circulated by the Catholic press,—as his *Motu Proprio*. He deals with the "modernist" movement and propaganda; and, speaking of it, laid down the following conditions and regulations, which he ordered Catholics to follow. He said in part:

"In the first place, as regard to studies, we shall not ordain that scholastic philosophy be made the basis of the sacred sciences. It goes without saying that if anything is met with among the scholastic doctors which may be regarded as an excess of subtlety, or too carelessly stated; if there is anything which does not square with later discoveries, or which is altogether destitute of probability, we have no desire whatever to propose it for the imitation of present generations. And let it be clearly understood above all things that the scholastic philosophy we prescribe is that which the angelic doctor has bequeathed to us. . . . In the vast and varied abundance of studies opening before the mind desirous of truth, everybody knows how the old maxim describes theology as so far in front of all others that every science and art should serve it and be to it as handmaidens. . . . Anyone who in any way is found to be imbued with modernism is to be excluded without compunction from these offices, and those who already occupy them are to be removed. . . . Equal diligence and severity are to be used in examining and selecting candidates for holy orders. . . . It is also the duty of the bishops to prevent writings infected with modernism, or favorable to it, from being read when they have been published, and

to hinder their publication when they have not. No book or paper or periodical of this kind must ever be permitted to seminarists or university students. . . . The Holy See neglects no means to put down writings of this kind, but the number of them has now grown to such an extent that it is impossible to censure them all. . . . It is forbidden to secular priests, without the previous consent of the ordinary, to undertake the direction of papers or periodicals. . . . Let priests hold as sacred the authority of their prelates, let them take it for certain that the sacerdotal ministry, if not exercised under the guidance of the bishops, can never be either holy, or very fruitful or without blemish. . . . It is impossible to approve in Catholic publications of a style inspired by unsound novelty which seems to deride the piety of the faithful and dwells on the introduction of a new order of Christian life, on new ordinances of the Church, on new aspirations of the modern soul, on a new vocation of the clergy, on a new Christian civilization. . . . Ancient relics are to retain the veneration they have always enjoyed, except in those individual instances when there are clear arguments that they are false.

Modern Language Association of America. A society for the advancement of the study of modern languages and their literatures, through the promotion of friendly relations among scholars, the presentation and discussion of papers at meetings and the publication of results of investigations by members. It was incorporated in Baltimore in 1883, and membership is open to all persons on payment of \$3 annual dues. For geographical reasons a Central Association was incorporated in 1903, which holds meetings in the Western States independently of the parent body. A new England branch holds meetings annually. The association issues an annual volume of Publications in quarterly instalments. There are about 700 active and 38 honorary members.

Modern Maccabees, Knights of the, an American fraternal organization founded in 1881. It has 1,204 branch tents, or lodges, and a total memberships of 106,823. During 1902, the organization disbursed \$1,356,469 in insurance benefits.

Modern Woodmen of America. See WOODMEN OF AMERICA, FRATERNITY OF MODERN.

Modes'to, Cal., city, county-seat of Stanislaus County; on the Tuolumne River, and on the Southern Pacific Railroad; about 80 miles south by east of Sacramento. It is in a productive agricultural region, the system of irrigation contributing greatly to its prosperity. The trade consists chiefly of wool, grain, fruit, and wine. The prominent buildings are the county court-house, county hospital, and churches. Pop. (1910) 4,034.

Modjeska, mōd-jēr'ka, Helena, Polish actress: b. Cracow 12 Oct. 1841; d. Bay City, Cal., 8 April 1909. Her father was a musician. In 1860, having married a theatrical manager, Modrzejewski, whose name she has since softened to Modjeska, she began to act, and soon gained local fame. After her husband's death she appeared in Warsaw in 1868, after marrying

Count Bozenta Chlapowski in September of that year. In 1876 she came with the latter to America. In July 1877, at San Francisco, she made her American debut as Adrienne Lecouvreur in an English version of the play by Scribe and Legouve. Three years later she was seen in London as Camille, and from that time she was one of the foremost actresses of the English-speaking tragic stage. She starred with Booth in 1880-90. Her best roles were Shakespearean, notably Lady Macbeth, Cleopatra, Ophelia, and Viola.

Modjeski, Ralph, American civil engineer: b. Cracow, Poland 27 Jan. 1861. He came to the United States with his mother in 1876 and, for American naturalization, he changed his name to Modjesko, his mother being the celebrated tragedienne, Helen Modjeska. He was graduated at the College des Ponts et Chaussées, Paris, at the head of the class and with honors. He has built many bridges in the United States, among them being the government bridge at Rock Island and the McKinley bridge at St. Louis. He was in charge of the reconstruction of the Northern Pacific R. R. bridge at Bismarck, N. D., and a member of the board of engineers for the reconstruction of the Quebec bridge. Since 1892 he has been consulting bridge engineer at Chicago. Is a member of the American Society of Civil Engineers, the British Institute of Civil Engineers, the Association Amicale des Ingénieurs Civils des Ponts et Chaussées de France, the American Railway Engineering and Maintenance of Way Association, and the Chicago Engineers Club.

Modoc (mò'dók) Indians, tribe of Northern California, which in 1872, after firing on the United States forces, retreated to the neighboring lava beds, and there defended themselves desperately till June, 1873, killing or wounding 132 of the troops. Their chief, Captain Jack, and three others, were hanged in October; about 100 who had not followed him were permitted to remain in California, the rest (145) were transferred to Indian Territory. The Modocs originally made their home on the shores of Lost River and Klamath Lake. They called themselves the *Maklaks*, or "the people." They were always a warlike tribe, and when not fighting emigrants and settlers in the early days, were warring with other tribes in their neighborhood. The surviving Modocs now reside at the Klamath Reservation in California.

Modulation, in music, is the act of moving through the sounds in the harmony of any particular key to those of another, or the transition from one key to another. The simplest form is the change from a given key to one nearly related to it, namely, its fifth (dominant), fourth (subdominant), its relative minor, or the relative minor of its fifth. Modulation into the dominant is effected by introducing in any of the parts (rarely in the bass, however) the sharp fourth, which becomes the seventh of the new key; thus, in the key of C, F would be sharpened to effect the transition into the key of G; to pass from that key into that of D it would be necessary to sharpen the C, and so on. In modulating into the subdominant the flat seventh is used, which becomes the fourth of the new key; thus, in passing from

the key of C to that of F, the flat B is introduced, and from the key of F to that of B the E is flattened, and so on. The modulation into the relative minor is generally effected by employing the sharp fifth, which becomes the seventh or leading note of the new key; thus in changing from C to A minor the G should be sharpened. As almost every piece ends on the key in which it begins, a second modulation becomes necessary; this is effected by flattening the fifth of the new key if the first modulation is into the dominant, and sharpening the fourth if in the subdominant. When a composer aims at a striking effect he may change from some given key to one quite unrelated, from C to E for instance; but such transitions should be sparingly employed. Modulation is generally resorted to in compositions of some length, for the purpose of catching and pleasing the ear with a fresh succession of chords. See also MUSIC.

Modulus, in mathematics, a constant referring to properties of matter in certain equations. As stress is proportional to strain within the elastic limits, some constant quantity may be introduced, making this proportionality into an equality. In dealing with strength of materials, such a constant is called a modulus. Thus in Hooke's law, which says that extension, as of a bar, is proportional to the extending force, the constant which converts this proportionality into an equality is called the modulus of elasticity, or Young's modulus, and is denoted by E. Where the elastic limits are not exceeded, the transverse strain—i. e. the contraction per unit of transverse dimension—is from one-third to one-fourth the longitudinal strain. The symbol denoting the modulus of elasticity of bulk is K. It denotes the lessening of bulk per unit cube, usually per cubic inch, under hydrostatic stress. If P be the shearing stress, and S the shear strain, then $P = N\epsilon$, where N is the modulus of rigidity. See ELASTICITY.

Moë, Alfred Keane, American consul: b. Buffalo, N. Y., 5 Oct. 1874. He was graduated from Harvard in 1897, and attended the Harvard Law School for one year. After admission to the bar and the practice of law for several years, he entered on his consular career in 1902, being first appointed consul at Tegucigalpa, and serving till 1904. From 1904-9 he was consul at Dublin, Ireland, and in the latter year was transferred, in the same capacity, to Bordeaux, France. He is the author of 'A History of Harvard,' written in a humorous vein, (1896); and 'Honduras' (1903).

Möbius, mé'bē-ōos, August Ferdinand, German astronomer: b. Schulpforta, Germany, 17 Nov. 1790; d. Leipzig 26 Sept. 1868. He was graduated from the University of Leipzig in 1815, and was for 30 years professor of astronomy there. Through his efforts the observatory was remodeled and by his writings he established a new principle concerning the affinities of figures and proved the close connection between statics and geometry. He published: 'Der Barycentrische Calcul' (1827); 'Lehrbuch der Statik' (1837); 'Die Elemente der Mechanik des Himmels' (1843); etc.

Moeller, mē'lēr, Henry, American Roman Catholic prelate: b. Cincinnati, Ohio, 11 Dec.

1849. His elementary studies were pursued at Saint Joseph's parochial school and he afterwards attended Saint Xavier's College. In 1869 he went to the American College, Rome, where he followed a seven years' course in philosophy and theology. He was ordained priest in the Church of Saint John Lateran, Rome, 10 June 1876, and after his return to Cincinnati was made pastor of Bellefontaine and later appointed to a professorship in Mount Saint Mary's Seminary, remaining there till 1879. In 1880 Archbishop Elder named him chancellor of the diocese of Cincinnati, and on 25 Aug. 1900 he was consecrated bishop of Columbus, Ohio. In April 1903 the Holy See appointed him Coadjutor Archbishop of Cincinnati with right of succession, and on the death of Archbishop Elder, 31 Oct. 1904, he assumed charge of the archdiocese, the pallium being conferred upon him 15 Feb. 1905.

Moeller, Louis, American genre painter: b. New York 5 Aug. 1835. He worked with his father, a decorator, for four years; studied in Munich with Diez and Duveneck; and in 1883 returned to New York. He became a member of the National Academy in 1895, and has exhibited there since 1883. Among his works are: 'Morning News,' 'Puzzled,' 'Short Measure,' 'An Interior,' etc.

Moria, mē'ris, Egypt, an ancient artificial lake north of Medinet-el-Fayum, until recent years confounded with Birket-el-Keroon (q.v.)—lake of the horn—with which it was connected. According to Herodotus, Lake Moria was 350 miles in circumference, and about 300 feet deep. He states it to have been entirely the product of human industry. Birket-el-Keroon, about 30 or 40 miles long and 6 broad, is a natural basin. The works, therefore, which Herodotus attributes to King Moris (Amenemhat III.) are the Bahr Jusuf (Canal of Joseph), which connected Moris with the Nile, and the canal connecting with the Birket-el-Keroon. The fisheries of the lake were very productive. The revenue derived from them went to the Egyptian queens. The colossal statues described by Herodotus are evidently those discovered at Biahmu at the end of the 19th century.

Moesia, mē'shi-ā, a province of the ancient Roman Empire, lying north of Thrace and Macedonia, and south of the Danube, corresponding to modern Serbia and Bulgaria (q.v.). Its original inhabitants were, according to Strabo, a tribe of Thracians. In 227 a.c. a large body of Gaulish invaders entered Moesia after the death of their leader, Brennus, and settled there under the name of Scordisci. The Romans first invaded it in 75 a.c., penetrating as far as the Danube. It was not, however, until 29 a.c. that it was finally subjugated. The Visigoths (Moesogoths) settled here in the 4th century, and it was afterward conquered by the Slavonians and Bulgarians.

Moffat, mōf'at, Robert, Scottish missionary to South Africa: b. Ormiston, East Lothian, 21 Dec. 1795; d. Leigh 8 Aug. 1883. He obtained an ordinary education; became a gardener; and about 1813, being deeply moved by the story of some Methodist missionaries, decided to go to Africa, whither he was sent in 1816 by the London Missionary Society. His first work was in Namaqualand, where he made a convert of Afrikaner, a Hottentot robber; later he settled among the Bechuanas in Kuruman,

where his wife, daughter of his former employer who married him in 1819, joined him and helped him greatly. Moffat, with the assistance of several other missionaries, translated parts and finally all of the Bible (1872) into the language of Bechuanaland. He returned to England in 1870, where his wife died in the following year, and spent the last years of his life in rousing interest in South African missions. One of his daughters married Dr Livingstone (q.v.), the missionary and explorer. Consult: 'The lives of Robert and Mary Moffat,' by John S. Moffat, their son (1885).

Moffat, William David, American publisher and author: b. Princeton, N. J., 17 Jan. 1865. He was graduated from Princeton University in 1884 and entered the publishing business. In 1897 he became business manager of 'The Book Buyer' and of 'Scribner's Magazine.' He has written: 'The County Pennant'; 'Brad Mattoon'; 'Not Without Honor'; etc.

Mogul, mō-gāl', the same as Mongol, applied particularly to the sovereigns of Mongolian origin, called Great or Grand Mogul, descendants of Tamerlane, who ruled in India from the 16th century.

Mohair. Mohair is the commercial and technical name of the fleece of the Angora goat. The word comes to the English through the Old French *moherre*, from the Arabic *mukhayyar*, meaning mohair cloth. In color mohair is pure white, except in rare cases, and grows in ringlets. The hairs composing a fleece are of varying lengths, but the average annual growth of the long hairs, which largely predominate, is about 10 inches. The hairs are not composed of epithelia, as is the case with wool, and therefore the felting property characteristic of wool is wanting. In fineness mohair is variable with the individual animals, and is placed between the fine and coarse wools; in lustre, durability, and strength it has no equal among fibres.

The only vitiating feature of mohair as it comes from the animal is the intermixture of an undercoat of lustreless, chalky-white hairs which vary in length from one to three inches, and vary in total amount according to the breeding of the animal. This undercoat is known technically as "kemp," and the principal objection to it is that it does not take the fast dyes. It becomes necessary, therefore, to remove the kemp from the mohair used in the finest fabrics, and this work is done by a comb which, in removing the kemp, also takes out every mohair fibre of equal length or shorter than the kemp. This entails a loss ranging from 10 to 30 per cent, but the average is becoming smaller as better goats are developed.

The lustre of mohair is very pronounced, and no amount of washing, dyeing, or other manipulation will dull it. Its durability is remarkable, and because of this fact it enters largely into goods of fine quality but which are subjected to hard usage, such as railway plush. Fast dyes have such an affinity for it that sunshine and storms have no effect on its brilliancy.

The uses of mohair are multifarious, and are capable of wider expansion as the supply of mohair becomes larger. Its largest use is in the manufacture of plush. Practically all of the railway plush of the world is made of mo-

hair, and also large quantities of furniture plushes of varying qualities and numerous designs. It enters into brilliantine, zibeline, and crepon dress goods, coat linings, so-called alpaca goods, imitation Astrakhan for capes, coats, and muffs, and many other fabrics under trade names which do not show what the goods are.

There are about three countries producing mohair in appreciable quantities as yet: Turkey in Asia, with 10,000,000 pounds annually; South Africa, with 12,000,000 pounds annually; and the United States, with 2,000,000 pounds annually. (These figures are approximated.) The prices ruling in the United States are from 25 to 45 cents per pound. In New England and New York there are mills which consume all of the American product, besides importing large quantities of Turkish and South African hair from Bradford, England.

GEORGE FAYETTE THOMPSON,
Author of 'Mohair and Mohair Manufactures.'

Mohair Goat, the Angora goat. See GOAT.

Mohammed ("The Praised One"; also written: Mahomet; Muhammad, the Arabic form; Mahmoud; Mehmet; etc.), Prophet and founder of Islamism, generally called by Christians Mohammedanism (but not so called by the followers of the faith of Islam): b. Mecca, Arabia, probably in April 569 A.D. (according to some authorities 570 and 571 A.D.); d. Medina, Arabia, 8 June 632 A.D. Mohammed was not born in the lowly state of life that we might be led to believe by some of the tales of his early life. On the contrary his progenitor, Hashim, of the illustrious tribe of Koreish, was the great benefactor of Mecca and the guardian of the Caaba, which alone vouches for his high position, as this honor was never conferred except upon those belonging to the most honorable tribes and families. Abdul-Muttalib, his son, succeeded to these honors, and the guardianship of the Caaba was confirmed in the line of Hashim by his valiant action in saving the sacred city from the onslaughts of the Christians of Abyssinia. Abdul-Muttalib had many children, and Abdallah was the youngest and most beloved. He was remarkable for personal beauty and possessed the secret of winning the hearts of women. He married Amina, of the tribe of Koreish, and on the night of the wedding, we are told, two hundred maidens died of broken hearts.

Mohammed was the only fruit of this marriage, and his father died two months after, leaving no other inheritance than five camels, a few sheep and a female slave. It is difficult to reconcile this fact with his former exalted position, but we are assured that it is true by the followers of the faith of Islam, as we are also asked to believe the statement that Amina suffered none of the pains of childbirth, and that Mohammed, on the moment of coming into the world, raised his eyes to heaven and exclaimed, "God is great! There is no god but God, and I am his prophet." Legend also tells us that wonderful signs and portents took place at the moment of Mohammed's birth. Lake Sawa dried up, and the sacred fire of Zoroaster which the Magi had kept burning uninterruptedly for over a thousand years, was suddenly extinguished, and all idols fell down. The massive palace of Khosrau, king of Persia, shook to its

foundations and several of its towers were thrown to earth.

When Abdallah died, Amina's grief was so great that it dried up her breasts, and she was forced to look for a nurse among the females of the Bedouin tribes. At length Halima, the wife of a Saadite shepherd took him into the mountains and nursed him, but returned him to his mother at the end of two years because he had epileptic fits. His mother died when he was six years old, and his grandfather, Abdul-Muttalib, adopted him. On Abdul's death, an uncle, Abu Talib, took the lad, brought him up and remained his closest companion and devoted protector throughout his life. His uncle was a merchant and brought Mohammed up in the same line. On one of his trips to Syria, he visited a Nestorian monastery and there imbibed many ideas the results of which show in his subsequent life. Even in his youth he carried religious contemplation to an extreme, and it is believed that his epilepsy had much to do with this morbid tendency in his character. Wonderful mental faculties are ascribed to him from his youth up, but as a matter of fact he was just as illiterate as most of his countrymen. When he was 25 years old he was employed by a rich widow, Kadijah, also of the tribe of Koreish. He displayed such good judgment and business qualities in caring for her caravans and other commercial interests that, in spite of the fact that she was already twice widowed, she married him. She was 15 years older than Mohammed, but bore him two sons and four daughters. Al-Kasim and Abd Allah, the two sons, who were respectively the oldest and the youngest of his children, both died in early youth; the four daughters survived—Fatima, Zainab, Rukaiya and Umm Kalthum. He lived with his wife in faithful and happy wedlock till her death.

With his marriage Mohammed acquired great wealth, and this gave him leisure to indulge the original bias of his mind; his old habits of contemplation were revived and he spent much time in religious speculation. His judgment and probity were widely respected and he seemed to be endowed with many wonderful gifts. There was a steady growth in his zeal to abolish idolatry and other evils, and to substitute a new and purer faith. This was fostered by his intercourse with Jews and Christians whom he was forced to meet in his journeyings. The idea of a new religion finally engrossed his whole mind and influenced his every action. He believed he saw the necessity for it; all sorts of new dogmas were creeping into and rapidly undermining the faith of his forefathers. During the first centuries of the Christian propaganda religious doctrines were more numerous than the stars in the sky; both Christianity and Judaism had crept into Arabia, Zoroastrianism was on the wane, and people refused any longer to accept and conform to the old pagan superstitions. Othman, Zaid and even Waraka, one of his wife's relatives, who had embraced Judaism, were preaching against the futility of star-worship, and their followers were ridiculing fetishes, ceremonies and even the temples. Many were being exhorted to Judaism while others were embracing Christianity, and others still were falling away altogether. Everyone was looking for a religion which should embody the faith of their forefathers with the simple doctrine of the unity

MOHAMMED

of the Deity. This picture presented itself to Mohammed with all its attendant consequences. Something had to be done—the time was ripe, and Mohammed stepped into the breach, launching the faith of Islam. He went back to the beginning of things, and adopted as a hypothesis that God had incultured in Adam the one and only true religion—the worship of one indivisible and only God, the Creator. He believed that this religion of Adam had been repeatedly debased, and almost forgotten at times, but that a succession of prophets was destined to come into the world to restore it from time to time and bring men's minds back to the original idea—such prophets were Noah, Abraham, Moses and Jesus Christ. These had all fulfilled their respective missions, but man now needed another guide to bring him back to God. It is not to be wondered at that Mohammed looked especially to Abraham, the father of Ishmael, the progenitor of his own race, as one of the greatest of these. With the development of this idea of the oneness of God grew Mohammed's mission as he conceived it. We can scarcely doubt that he was honest in his convictions and in his purpose when he first undertook the reformation of the world, which he really began at the age of 40 years. It is a matter of opinion as to whether he continued to give his efforts in a purely unselfish way during the later periods of his life. It would seem that his original honesty of purpose became lost in his efforts for personal aggrandizement, the ambition to assume the prophetic character, and the possible influence of his hereditary disease, epilepsy. Be this as it may, let us follow out his life and see what he accomplished.

Mohammed's first convert was his wife, Kadijah, to whom he told the particulars of an interview which he claimed to have had in a vision with the angel Gabriel, who declared him to be the apostle of God. He was passing, as was his custom, the month of Ramadan in the cave of Mount Hara after fasting, prayer and meditation, when the angel Gabriel appeared to him, displaying a silken cloth covered with writing. "Read!" said the angel. "I know not how to read!" replied Mohammed. "Read," repeated the angel; and immediately he was illumined with celestial light and understanding, and read what was written upon the cloth, which contained the decrees of God as afterward promulgated in the Koran. Through his wife, her uncle, Waraka, was won back from Christianity and became serviceable to Mohammed on account of his great knowledge of the Old and New Testaments. The next to be converted were the fiery Ali, his nephew, and Zaid his faithful servant; also Abu Bekr, a man of high position, at whose solicitation ten of the best citizens of Mecca joined the faith. Mohammed confided his revelations only to members of his household for a time, and was laughed at by some and reproached by others—Abu Lahab, an uncle, called him a fool, and Abu Talib his adoptive father, while always protecting him, never actually confessed belief in his works. Mohammed personally instructed all his early converts in the doctrines of the new faith of Islam. After four years Mohammed's converts numbered but 40, and they were obliged to hold their meetings in secret in a cave near Mecca. Even here they were discovered and attacked by a rabble. Mohammed had much to contend with in these

early days; many members of his tribe were against him, and Abu Lahab, his uncle, a rich and influential man, openly and rancorously opposed what he called Mohammed's heresy.

In answer to a vision Mohammed now began to preach publicly, and summoned all the Koreishites of the line of Hashim to meet him on the hill of Safa. Scarcely had he begun his discourse when Abu Lahab attempted to hurl a stone at him. Mohammed turned, cursing the hand thus raised against him and predicting his doom, with the further assurance that his wife Omm Jemil would help build his death-fire. Mohammed soon called another meeting and this time boldly announced his divine command to impart his revelations received from heaven. At this meeting he called for a vizier or vicergerent; Ali was selected as he alone volunteered. Although the doctrines of Mohammed were received thus ungraciously by his family and friends, he soon found a following among the people at large. He threw off all reserve and worked assiduously for his cause, proclaiming himself a prophet sent by God to put an end to idolatry. His favorite places of preaching were the sanctified hills of Safa and Kubeis; Mount Hara was his Sinai, whether he retired for contemplation and fresh revelations. He was often attacked with open force by his enemies, and in the 10th year of his prophetic office was deprived by death of his faithful wife Kadijah and Abu Talib. He then retired to the city of Taif but kept gaining numerous followers, among others many inhabitants of Medina. About this time occurred his famous vision in which he claimed to have made a nocturnal journey to heaven on the beast Al Borak, as referred to in the Koran. Shortly after, a conspiracy to murder him was set on foot, and he was obliged to flee to Medina. This took place in 622 A.D., and is known as the Hégira ("flight") and marks the beginning of the Mohammedan era.

Mohammed was accorded a warm reception in Medina and set about promulgating a systematic propaganda of his doctrines. He organized the followers of the faith of Islam, and provided set forms of worship and religious observances; he proselytized the Jews and other sects in the neighborhood and made many concessions to draw them to the new faith. As a result he was made judge and then ruler of Medina, and boldly assumed regal authority and dignity. After marrying Ayesha, the daughter of Abu Bekr, he announced his determination to take up the sword in furtherance of his doctrines. The hope of plunder thus held out brought him hordes of followers. His first expedition attacked a rich Koreishite caravan led by Abu Sofian, and rich booty was secured and divided. But Abu Sofian returned shortly with 3,000 soldiers and utterly routed Mohammed who had but 1,000. Mohammed, badly wounded, managed to escape. He rallied his troops, however, and gained new followers, by seductive promises, explaining that the defeat was due to the sins of his adherents. In 627 Abu Sofian again brought an expedition against him and laid siege to Medina with a force of 10,000 men. After 30 days, however, his forces broke and dispersed on account of internal discord. Mohammed then led his army against the Jews who had sided with the Koreishites, and took a bloody revenge. Over 700 men were massacred, and the women

MOHAMMED

and children were carried into slavery. From this time on Mohammed's thirst for warfare and blood seemed to be insatiable. At the same time his whole nature apparently underwent a change and he began to give way to the most sensuous practices. He introduced a special chapter in the Koran to give himself permission to marry Zainab, the wife of his former slave Zaid. He followed this from time to time with numerous other marriages and amours and multiplied them to such an extent that at the time of his death he had no less than nine wives. All these affairs he explained by his divine mission, although they were diametrically opposed to his own laws as set forth in the Koran. His ambition and his views continued to expand with numerous successes in warfare and the tremendous growth in the number of his now almost worshipping converts. He gradually conquered all the small surrounding tribes of Arabia; and then becoming still more ambitious and arrogant, sent deputations as missionaries beyond the frontiers. He sent to Khosrau Parviz, king of Persia; Heraclius, emperor of Constantinople; Mokawkas, ruler of Egypt; the king of Ethiopia, and the princes of various districts of Arabia, to embrace the new revelation of the divine law made through him. The stronger and more remote principalities rebelled, but the weaker at once adopted the faith of Islam. The king of Persia and Amru, the Ghassanide, rebelled, and Amru had the ambassador from Mohammed executed. This caused the first war between the Moslems and the Christians. The Moslems were beaten with great loss.

Mohammed now saw the importance of regaining the holy city and prepared what afterward came to be known as the "First Pilgrimage." In 630 he appeared before the gates with 1,400 of the faithful. He succeeded in making a peaceful entrance into the city, telling the Koreishites that he was on a mission of peace and wished only to worship in the Caaba. He and his followers were granted three days for this purpose and left on the fourth day, but not without having won over many Koreishites to the new faith, among them being Amru, Othman, and Khaled. Soon after this Mohammed nearly died from the effects of poison administered to him by a Jewess.

He now determined to wrest Mecca from the hands of the Koreishites; in 630, or the 8th year of the Hegira, he marched against the city with 10,000 soldiers. The inhabitants, seeing the futility of attempting any resistance, gave up the holy city into Mohammed's hands, receiving their life and liberty providing they accepted the faith of Islam. The Caaba was refurnished, the idols thrown down, but Mohammed wisely refrained from destroying the ancient Black Stone, regenerating it with his own holy touch. Thus the temple became the sanctuary of the faith of Islam. This exercised a wonderful effect all over Arabia and the next year (9 of the Hegira) embassies arrived from all points of the compass to make submission to Mohammed. This is called "The year of Embassies."

In order to intimidate Heraclius, the emperor, Mohammed marched into Syria half way to Damascus, at the head of an army composed of 20,000 foot soldiers and 10,000 horse, but returned to Medina without making an attack. He then extended free worship to the Christians

in consideration of tribute, added a new chapter to the Koran, revoking all regulations in favor of idolaters, and then promulgated his great and last pilgrimage to Mecca, known as the "Valedictory Pilgrimage." This was, perhaps, the most important event of his life. It was toward the close of the 10th year of the Hegira that he started this immense pilgrimage to Mecca, accompanied by a throng which has been variously estimated at from 40,000 to 150,000 persons. He preached to them from Mount Arafat, exhorting the faithful to piety and righteousness, to abstain from sin and to protect the weak. On his return to Medina he shortly fell sick and declined rapidly. He gave instructions that Abu Belr and Umma, the son of Zaid, should be the leaders of the army, and expired in the arms of his favorite wife Ayesha, 12th day, 3d month, year 11 of the Hegira (8 June 632 A.D.) He was buried in the house of Ayesha where he died. It afterward was annexed to an adjoining mosque which became a place of pilgrimage for generations of Mohammedans.

Mohammed's personal appearance, as far as we are able to judge from Arabic tradition, was neither imposing nor pleasing, but inspiring. He was not above medium height, but was broad-shouldered and deep of chest; he was strongly and compactly built; head, large; brow, high; face, round and ruddy; mouth, large; nose, long and aquiline. His eyes, large, black and fiery, were full of his peculiar magnetic personal power. He wore his black hair long and curly and his beard remained unwhitened at his death. A large birthmark between his shoulders was looked upon as the holy mark of prophecy. His personality was strong and dominant, but his domestic life was as simple as was his frugality at meals. He was kind and generous, a tender father and a loyal friend. Even at the height of his power he lived in a miserable hut, slept upon straw, and his pillow was made of palm leaves covered with leather. His life was withal a strange contradiction, for at times he was deceitful, cunning and cowardly, and in his later years gave way to gross sensuality. His mind in spite of his religion contained a strong admixture of superstition; he believed in omens, charms, and good and bad spirits. Spasmodic convulsions always accompanied his visions or divine revelations, and by many were attributed to his disease of epilepsy. At such times he would perspire profusely and remain in a weakened condition for some time after.

As a political leader and a religious reformer Mohammed undoubtedly ranks among the greatest. Whether he were a real prophet or a charlatan, or a mixture of both, we cannot strip him of the qualities of greatness. His name has survived 12 centuries and his followers to-day number over 175,000,000 living souls. Editorial Staff, 'Encyclopedia Americana.'

Mohammed I., Turkish sultan: b. 1375; d. 1421. He was son of Bajazet I., after whose death (1403) he became prince of Asia Minor and rival of his three brothers for the throne, to which he came in 1413, as the successor of Mousa. During his reign of eight years he strengthened the empire, which was suffering from the recent assaults of Timur (or Tamerlane), pushed its boundaries as far as the Danube, and fostered kindly relations with the Greek empire abroad, and literature, arts, and sciences at home.

Mohammed II., Turkish sultan: b. Adrianople, 1430; d. 1481. He succeeded his father, Murad II., in 1451; two years later undertook the siege of Constantinople, which he carried by storm after 53 days' siege; made the city his capital; made war on the Greek rulers in Morea and Trapezus, on Hunyadi of Hungary, on Scanderbeg, and on Venice, winning for his empire the provinces of Bosnia and Servia, as well as Euboea and Scutari (from Venice) and Kaffa (from Genoa), and for himself the names el-Ghazi, "the Conqueror," and Buyuk, "the Great"; and in 1481 had seized Otranto as a preparatory step to war on Naples when he suddenly died.

Mohammed III., Turkish sultan: b. 1566; d. 1603. He succeeded his father, Murad III., assuming himself the throne by the execution of his 19 brothers. He captured Erlau in Hungary (1596), but was unsuccessful in his further movements in Europe, being attacked in Asia by Abbas the Great, Shah of Persia.

Mohammed IV., Turkish sultan: b. 1642; d. 1691. His father, Ibrahim I., was murdered by the Janizaries, when Mohammed was only seven years old. He came to the throne under the nominal regency of his grandmother, which was soon exchanged for the actual control of the grand-viziers, the Kiuprili. Turkey's foreign policy was aggressive and successful under them; but in 1683 Kara Mustafa was defeated before Vienna. The Holy League, composed of Poland, Russia, Venice, and Leopold I., Roman emperor, then steadily gained victory after victory over the Turkish army, which rose against Mohammed, imprisoned him in 1687, and let him die in chains four years after the accession of his brother, Suleiman II.

Mohammed Ahmed, kh'medd. See MAHMUD, TUR.

Mohammed Amir Hasan Khan, k'mâr hâ'sen khân, Indian soldier, legislator, and author: b. India 16 June 1849. He was educated at Benares and Lucknow, served during the Mutiny, and received for his conduct a sword of honor at the great Lucknow durbar. From 1866 to 1900 he was in the legislature of Oudh, and at one time was a member of the legislative council at Calcutta. He published translations from Persian and Arabic into English, and three volumes of original poems.

Mohammedan Architecture. See ARCHITECTURE, Moslem.

Mohammedan Art. Although Mohammedan Art has no existence in the narrower sense of the word, there are nevertheless three aspects in which the subject is important. By the student of religion, Islam's attitude toward art deserves consideration; and the artistic possibility of the Arab mind, and the channels through which the artistic feelings, denied any true outlet, found expression, are of interest to the student of Islamic thought and civilization.

Any tendency toward art in Islam was crushed in the early days of that religion by Mohammed's personal attitude toward painting and sculpture. In the Koran, sura 5, v. 92, are found the following words: "O true believers, surely wine and lots and images . . . are an abomination and the work of Satan; therefore avoid them that ye may prosper." Again in two well-known traditions Mohammed stated that he who made a likeness of a man would, on the Great Day, be asked to furnish a soul for him also; failing in this he would be consigned to hell. He once said, "God sent me against three kinds of men; the proud, the polytheist, and the painter; take care, therefore, not to represent either God or man; but only trees, flowers, and inanimate objects." Such a sweeping prohibition as this well nigh dealt the death-blow to any attempt at expressing the feeling in any form, outside of language. The reverence paid to the utterances of Mohammed may be seen in the pious Moslem's custom of using only plain pieces of ivory in the game of chess; Mohammed's stricture being understood to apply to the images of horse, man, and elephant used in that game. Mohammed's attitude, therefore, toward those things which constitute art, in the narrower sense of the word, was occasioned by his religious scruples against any representation that might serve as an object of worship.

Had it not been for this attitude of early Islam, art might have developed among the Arabs, and later among the adherents of Islam, to a surprising degree. There are many characteristics of the Arab mind, which they impressed on those who adopted their religion, that might have created a unique school of art just as Islam is a unique religion. The Arab, in his native home had little that would help him in establishing any definite lines of form capable of serving as a basic principle in production. There was little to suggest any definite lines of demarcation in the sandy deserts extending as far as the eye could reach. Yet it is due to this fact that in the Arab a lawless, fantastic imagination was cultivated which, had it been directed along proper lines, as it would have been under the influence of the superior culture of those they conquered, might have been prolific of great results. It is probable, also, that in the desert the Arab received his lessons in color, the intensity of which was rendered very high by the clarified atmosphere. In the verdure that did exist in the fertile regions he has been largely influenced by the waving graceful lines of the palm trees, lines which are reproduced in the domes that decorate the mosques.

The Moslem, however, has found many fields in which the artistic principle might express itself, and as decorators they are second to none. In combinations of colors there are always certain principles observed that render the object pleasing to the eye. This holds true of mural ornamentations as well as of the colors intro-

decorated into woven goods and glassware. In buildings these colors were combined with gold and marble in rich profusion. Har, governor of Mosul (106 to 117 A.H.), had a palace of pure white alabaster, the walls of which were inlaid with stones of different colors, set off with beams of carved teak. This palace was known as the *monkusha*, "painted." In more pretentious buildings floors were often paved with marble, each slab of which was separated from the next by bands of gold. Artistic blending of colors and intricacies of designing were found in the woven stuff, for which Oman was especially celebrated. A favorite style was that in which gold thread was run through colored cloth. In Damietta beautiful specimens of this art were common. Silk or half-silk cloth of various colors were woven with arabesques of gold. Other patterns, in defiance of prejudice, consisted of the images of horses, birds, elephants, etc. Sometimes hunting scenes were depicted. Much of this work was done by the Copts.

In the production of glassware Syria early excelled. Glass of many colors was produced profusely ornamented with gold. These soon became articles of luxury; and one native historian mentions a goblet that came from the treasuries of the Fatimides, which sold for 360 dinars. From the same treasuries 18,000 glass vessels were sold. These glasses were either engraved with figures, within and without, or burnt in many colors. The arabesque is a style of ornament carried to a high degree of beauty. One of the main points in this design consists in excluding any representation of natural flowers or vines. Conventional vines and flowers are common, however, and these are set off with inscriptions, or combinations of lines and circles. Color is then added, "distributed with exquisite tact as regards high notes and neutral tints."

Sporadic mention is made of painters, and some few names are saved by the historians Makrizi and Abul Fida; but painting like gilding was almost entirely confined to mural decoration. A story, interesting in that it shows that the Moslem's attitude toward art was not always what it should be may be mentioned here. Two painters, Ibn Aziz and Kosair, agreed each to paint a figure for a certain vizier, one figure to seem to enter the wall on which it was painted, the other to seem to spring from the wall. This they did. Kosair painted a dancer in white garments against a black background; and Ibn Aziz painted his dancer in red on a yellow background. As each painter substantiated his claims the vizier rewarded them richly.

The Arabic alphabet was a field upon which the artistic ingenuity of the Moslem was expended with good results. The older Cufic characters were soon supplanted by more graceful, flowing letters with many ligatures and rich voluptuous lines. These characters easily lent themselves to intricate systems of interweaving with which the walls of mosques might be decorated. Verses of the Koran were used for this purpose, and were reproduced in letters of gold, on white marble. Sometimes glass of highest finish was used for these inscriptions. They were generally white and blue. One artist, whose skill in the formation of such inscriptions was well known, lived in the time of Walid I. He is the artist who wrote the gold inscription in the Prophet's Mosque at Medina, an inscrip-

tion which consists of several short suras of the Koran. Houses also were decorated with these inscriptions from the Koran or the Poets. Many doors are ornamented in Egypt with inscriptions set off by colors, though this is a superstition in this case.

It was in Spain, however, among the Moors, that art reached its highest development. Here painting and sculpture were cultivated and were used extensively for decorating palaces and houses. The civilization attained by the Moors when the rest of Europe was sunk in ignorance has been a theme on which historians have dwelt at length. Artistic handiwork of all kinds was excelled in; even keys were exquisitely decorated. "Potters had attained to the art of producing a ware shining with iridescent gold or copper lustre." In the great mosque of Cordova there was a pulpit "constructed of ivory and choice wood, in 36,000 separate panels, most of which were encrusted with precious stones and fastened with gold nails." There were also numerous works of sculpture and paintings found in az-Zahra. The sculptured lions and paintings of Alhambra, still to be seen, show to what extent the arts progressed among the Arabs of Spain.

Mohammedan Literature. See ARABIA, Literature.

Mohammedanism is the term frequently given to the religion taught by Mohammed; but it is not used by the followers of that religion. Abu-Bekr, the first caliph, is reported to have said that it is not Mohammed, but the God of Mohammed, that we worship. The term by which the religion is known, wherever professed, is Islam, "submission to the will of God." Those who embrace Islam are called Muslim (frequently written Moslem), a participle of the same stem from which the verbal noun Islam is derived. Still another term, used as the equivalent for Moslem, is Mumin, "believer." It, likewise, is a participle, formed from the stem that gives rise to the word Imán, "faith."

Islam is the religion professed by Turkey, Syria, Palestine, Arabia, Persia, Asia Minor, Afghanistan, Baluchistan, Turkistan, and the Malay Peninsula. India has more than 57,000,000 Moslems. China has about 25,000,000. Owing to the great difficulty of securing exact figures from many of the places where Islam is supreme, an accurate statement as to the number of its adherents is impossible. It is generally estimated at 175,000,000.

Islam is divided by the theologians into two heads: Imán, "faith," and Din, "practice." The separate articles of both heads are determined by the Koran, the Traditions or sayings of Mohammed, and the decisions of the learned officials. Under Imán are given six cardinal points of belief, as follows: belief in God and his unity; belief in angels, and good and bad spirits; belief in the Koran and revelation; belief in the Prophet; belief in the resurrection and the judgment day; belief in God's absolute rule of the world, "There is no god but Allah, and Mohammed is his envoy."

The latter part of this statement will be treated of in its proper place; here it is Islam's conception of the deity that must

be set forth. He is above all omnipotent. No phrase occurs more frequently than this: "and he is powerful over all things." He is omniscient; "And he knoweth all things," is a phrase equally often met in the Koran. "With him are the keys of the secret things; none knoweth them besides himself: he knoweth that which is on the dry land and in the sea; there falleth no leaf but he knoweth it; neither is there a single grain in the dark parts of the earth, neither a green thing nor a dry thing but it is written in the perspicuous book." (Sura 6, 59.) "He is the ever-living, eternal God." "God! there is no God but he; the living, the self-subsisting; neither slumber nor sleep seizeth him; to him belongeth whatsoever is in heaven or on earth." (Ibid.) He is, moreover, the creator of all things. "His is the kingdom of heaven and earth; he giveth life and he putteth to death; and he is almighty. He is the first and the last; the manifest and the hidden; and he knoweth all things. It is he who created the heavens and the earth in six days, and then ascended his throne." (Sura 57, v. 2.) His word alone creates, "When he decreeth a thing, he only saith unto it, 'Be, and it is.'" (Sura 3, v. 4), cf. (Sura 11, v. 9). As a creator he works not as man works. "We created the heavens and the earth and whatever is between them, in six days, and no weariness affected us." (Sura 50, v. 37.) Mohammed's account of creation, founded on the Old Testament account, is rather confused, especially his ideas as to what acts of creation were performed on the separate days. His assertion "no weariness affected us" (God is the speaker, of course) is a refutation of the Jewish idea, as he understood it, that God needed a rest day.

He is not only creator of all things, but ruler of all things, and protector as well. "It is he who causeth you to sleep by night, and knoweth what ye merit by day; he also awaketh you therein, that the prefixed term of your lives may be fulfilled. . . . He is supreme over his servants, and sendeth his guardian angels to watch over you, until, when death overtaketh one of you, our messengers cause him to die; and they will not neglect our commands. . . . Say, who delivereth you from the darkness of the land, and of the sea, when ye call upon him humbly and in private, saying 'verily, if thou deliver us from these dangers, we will surely be thankful.' Say, God delivereth you from them and from every grief of mind." (Sura 6 v.) His care is always assured to those who follow his way. "Say, my Lord hath commanded me to observe justice; therefore set your face to pray at every place of worship, and call upon him, approving unto him the sincerity of your religion. . . . A part of mankind hath he directed." (Sura 7, 28.) "Whoever therefore shall deny Tagut and believe in God, he shall surely take hold on a strong handle, which shall not be broken; God is he who heareth and seeth. God is the patron of those who believe; he shall lead them out of darkness into light." (Sura 2, v. 257.)

Though he is the ruler of all things and may do as seemeth good in his sight, yet is he a just God, and punishes only where punishment is due. "We will appoint just balances for the day of resurrection; neither shall any soul be injured at all; although the merit or guilt of an action be of the weight of a grain of mustard

seed only, we will produce it publicly; and there will be sufficient accountants with us." (Sura 21, v. 48.) Those who suffer have gone astray or are being prepared for better things. "Every soul shall taste of death; and we will prove you with evil and with good, for a trial of you." (Sura 21, v. 36.) Of those sorely tried it is said: "I have this day rewarded them, for that they suffered the injuries ye offered them, with patience; verily they enjoy great felicity." (Sura 23, 113.) As he is a just God, every creature is responsible to him, and must answer for his choice of good or bad, "Did ye think that we had created you in sport, and that ye should not be brought again before us? . . . whoever, together with the true God, shall invoke another god, concerning whom he hath no demonstrative proof, shall surely be brought to an account for the same before his Lord." (Ibid, v. 117.)

Though God is just, he is also merciful. "We do not lay upon any soul more than it can bear." (Sura 6, v. 153.) Like the God of the Hebrews he puts off the evil day in the hope that man may repent. "If God should punish men for their iniquity, he would not leave on the earth any moving thing; but he giveth them respite unto an appointed time." (Sura 16, v. 163.) The reconciliation, however, of mercy and justice was a problem that never occurred to Mohammed.

Another problem that Mohammed, very wisely, never considered is that of freedom of choice and God's absolute decree. Though the latter is a separate article (the sixth) of Imán, a brief statement of it will be given here. Everything that has happened or that will happen, has been already fixed by God. "Say, nothing shall befall us, but what God has decreed for us." (Sura 9, v. 51.) "No soul can die unless by the permission of God, according to what is written in the book containing the determination of things." (Sura 3, v. 141.) "He hath formed his creatures; and . . . determined them to various ends, and directed them to attain the same." (Sura 87, v. 2.) These and other passages in the Koran show that Mohammed was a firm believer in God's absolute decree of all things. He was no theologian, however, so there arose no question about this decree and man's free will. His attitude to the question may be shown by a quotation from sura 4, v. 80. "If good befall them they say it is from God; but if evil befall them, they say; this is from thee, O Mohammed: Say, all is from God; but what aileth these people that they are so far from understanding what is said unto them? Whatever good befall thee, O man, it is from God; and whatever evil befall thee, it is from thyself." He, as a religious man, could get no further than this contradiction, and he adjured his followers never to dispute over these points.

It is impossible to discuss here all the attributes and activities of God as they are given in his 99 names; but there is one more aspect of the Moslem's belief in God that must not be neglected. It is the most important attribute of the deity, and its statement is found in sura 112. "Say, God is one God; the eternal God; he begetteth not, neither is he begotten; and there is not anyone like unto him." In sura 19, v. 91, we read: "They say, the Merciful has begotten issue. Now have ye

MOHAMMEDANISM

uttered an impious thing.² These quotations show the Moslem's attitude toward Christianity. In Islam there is no Trinity; there is no Fatherhood; God has taken to himself no son; but is alone in his glory and power. Christ, to the Moslem, is a prophet. He was the word of God "conveyed into Mary." Islam, failing utterly to grasp the significance of Christ's life, could not accept the idea of his crucifixion. They have therefore found an end that they deem more worthy of a prophet, and in the Koran we read that one in the likeness of Christ was crucified.

Joined to the statement of the first great truth of Islam, "There is no god but God," is another statement considered by Moslems to be just as important; "and Mohammed is the envoy of God." Concerning his divine mission, Islam knows no doubt. He was the last and the greatest of all the prophets—"The seal of the Prophets." Of prophets, thousands are recognized by Islam; but there are six, only, deemed great enough to be the holder of a title; they are: Adam, Noah, Abraham, Moses, Jesus, and Mohammed. As a prophet, Mohammed announced himself to the world when he first recited the 60th sura: "Read in the name of thy Lord who hath created all things." He never claimed to be more than the envoy or prophet of God, and as such only is he revered by the intelligent Moslem. His tomb at Medina is an object of veneration to the Moslem world and should be visited by every pilgrim. His intercession may be asked in prayer; for he was the friend of God. Five times every day Islam testifies to its faith in God and its veneration for the prophet. Every Moslem must believe in revelation, "that which is sent down." (Sura 2, v. 3.) Beginning from earliest times, there have been numerous revelations, each of which was a law for mankind, till superseded by the next. So each of the six prophets mentioned was the recipient of a revelation. Mohammed's revelation, the Koran, is the only one not to be abrogated. It is distinctly the Word of God as revealed to Mohammed, and is on a higher plane than the Traditions, or inspired sayings of the prophet. It was inscribed on tablets in heaven from eternity. From time to time portions of it were given to Mohammed by the angel Gabriel.

The Moslem must believe, furthermore, in angels, of whom there are great numbers. They were created long before the world was, and are of a finer material. Every believer has two recording angels; one for his good, the other for his bad deeds. The angels are charged with intercession for mankind. Certain angels preside over hell. Two important angels are Munkar and Nakir; in these every Moslem believes most firmly. There are four arch-angels: Gabriel, the angel of Revelation; Michael, the patron of the Israelites; Izrafel, who, on the last day, will blow the trumpet, and Azrael, the angel of death. Besides these angels there are the *ginn*, good and bad spirits, in whom Mohammed believed. Sura 72 states that a band of them once passed Mohammed and paused to listen to him. What they heard caused them to exclaim: "verily, we have heard a marvelous discourse." Some of them are believers in Islam and perform all the duties that devolve upon the true believer. They may assume various forms, and are so numerous

that the pious Moslem, in performing the most trivial act, such as building a fire, is apt to exclaim "with your permission, ye blessed." By many it is believed that all *ginn* are to be destroyed on the last day; others believe there is to be a special place, outside of paradise, where such as have been believers may dwell.

In the immortality of the soul, resurrection, judgment, paradise, and hell, the Moslem believes most firmly. During the first night after death, the soul remains with the body, so that it may be questioned by the two angels Munkar and Nakir. It is a question as to whether the Koran refers to this belief or not; but nevertheless it is fixed in Islam. When the angels have finished their examination, they depart, leaving the believer in peace; the wicked in torment. This is the Moslem Hades. In sura 23, v. 99, speaking of unbelievers who have died, it is said: "behind them shall be a bar until the day of resurrection." The word translated by Sale "bar" is the Arabic *barsach*, and is explained by the native commentators as a partition between the living and the day of judgment, or as an intervening state between death and judgment. Generally speaking, it denotes the state of the departed soul, and must be entered by all. When the trumpet is blown on the last day all must appear. Mention of this day is very often made in the Koran, especially in the earlier suras. It is the one subject of suras 75, 81, 82, 83 and 84. On this day all actions shall be weighed. "Those whose balances shall be heavy with good works shall be happy; but those whose balances shall be light are those who shall lose their souls and shall remain in hell forever." (Sura 23, v. 104.) This great day, the coming of which is known to God alone, is to be ushered in by certain signs, divided into the "lesser" and the "greater." Of the former there are eight, such as decay of faith, turmoils, wars, etc.; of the latter there are 16, the sun will rise in the west; the Antichrist will appear; Jesus is to come to earth, embrace Islam and slay the Antichrist. The last trial of this day is to be the crossing of the bridge Sirat, which is finer than a hair and sharper than a sword. Still, the believer shall cross in safety while the wicked fall to the gulf below. Should any who have professed Islam, yet lived wicked lives, be consigned to hell, they are not to remain there forever; but will be gradually purified and released. To the Moslem, hell is for the followers of other religions.

In paradise the Moslem is to enjoy all those things which to the mind of the desert Arab seemed most desirable. Here are gardens, trees ever green, rivers ever flowing, beautiful maidens, appetites that, so far from being satiated, increase as the delights are enjoyed. Here, too, he shall always see the face of (his) God and praise him, to whose mercy he owes his bliss; for his works alone are not enough to assure him entrance.

Islam is not, however, a religion of faith only; for there are certain institutions, constituting Din, or religious practice, the performance of which is obligatory. Prayer, almsgiving, fasting, and the pilgrimage, are duties that tax the Moslem to no small degree. Prayers are to be made to God five times every day, and are to be made with the utmost decorum. Preparatory to these prayers there are certain ceremonies of purification, consisting of ablution, either partial or covering the entire body;

for the idea of an unclean person in the presence of God is intolerable to the Moslem. To facilitate these ablutions, every mosque is provided with a tank, whence issue many small streams of water. Should the worshipper be praying where there is no water, he may use sand or dust. As he ends this ceremony he is to testify that "There is no god but Allah, and Mohammed is his envoy," following this by reciting sura 97. Should the worshipper be conscious that he is clean, he may omit the ceremony. He then assumes a certain position, facing Mecca, and states softly that he intends to perform so many inclinations, following this by reciting the first sura. After this other expressions of praise are used. Though prayer is frequently mentioned in the Koran, the five periods at which it is enjoined are nowhere mentioned together. These periods are morning, noon, afternoon, sunset, and night. The approach of these hours is heralded by the muezzin, who, ascending the minaret of the mosque, cries out: "Allah is most great (four times); I testify that there is no god but Allah (twice); I testify that Mohammed is the envoy of Allah (twice); come to prayer (twice); come to security (twice); Allah is most great (twice); there is no god but Allah." Prayers may be said wherever the believer happens to be at the time; but on Friday they should be said at the mosque, where a sermon is also delivered.

Almsgiving is a very important duty in Islam and grew doubtlessly out of the natural hospitality of the Arabs. The Koran makes frequent mention of it, enjoining it in most emphatic terms. "O true believers, bestow alms of the good things which ye have gained, and of that which we have produced for you out of the earth, and choose not the bad thereof to give it in alms, such as ye would not accept yourself." (Sura 2, v. 269.) "If ye make your alms to appear, it is well; but if ye conceal them and give them unto the poor, this will be better for you, and will atone for your sins." (Ibid. 272.) How Mohammed considered alms may be seen from several passages of the Traditions, as quoted by Hughes. "Your smiling in your brother's face is alms; assisting the blind is alms." The Koran distinguishes between legal and voluntary alms; but this distinction has been done away with to a great extent. The necessity of giving, however, remains and alms are given regularly by those who neglect many of the other duties. In the early days of Islam legal alms were collected by officials appointed for that purpose; but their bestowal now is left to the individual conscience.

Fasting was considered of great importance by Mohammed, as thereby atonement might be made, and at the present day many who neglect their daily prayers perform all the duties of the fast. The month of Ramadan was chosen for the great fast, because in it revelation came to Mohammed. Throughout this month, during the entire day, drinking, eating, smoking, and many other indulgences are forbidden. When night comes, however, restrictions are removed till the next day. This fast is very severe when it falls in summer (the year being lunar, each month passes through all the seasons) and many exemptions are provided for those unable to undertake its arduous duties. Other fasts, meritorious, but not obligatory, are also in favor with Moslems. The object of these fasts is not alto-

gether concerned with the mortification of the body; the heart is to fast; it must abstain from worldly matters and commune with God.

Once at least in his life-time the Moslem must make the pilgrimage to Mecca. "We appointed the holy house of Mecca to be a place of resort for mankind, and a place of security; and said, Take the station of Abraham for a place of prayer; and we covenanted with Abraham and Ismael, that they should cleanse my house for those who should compass it, . . . and those who should bow down and worship there." (Sura 2, v. 119.) "And it is a duty toward God, incumbent on those who are able to go thither, to visit this house." (Sura 3, v. 97.) Some further regulations are found in sura 2, v. 194, and in sura 22. Trade may be indulged in while on the pilgrimage, and sura 5, v. 2, gives direction for women who contemplate the performance of this duty. When the pilgrim nears Mecca he bathes and puts on the Ihram, pilgrim's robe, and advances to the city. Here there are certain ablutions to be performed before kissing the Black Stone. He must then encircle the Caaba, the temple, seven times; kissing the Black Stone each time. After other prayers and ceremonies he must run between Mount Al-Safa and Mount Al-Marwa seven times, with stated prayers. Later he must visit the Valley of Mina and Mount Arafat where more prayers are performed. On the 10th day he proceeds to Mina and casts stones at three pillars which are set up there, seven stones at each. After this very ancient custom there is a sacrifice which ends the pilgrimage. The pilgrim may then be shaved and resume his usual clothing. He should, however, visit Medina and do homage at the tomb of Mohammed.

Though not reckoned as one of the pillars of Islam, still the obligation to wage holy wars has been so firmly held that it deserves mention here. In early days every Moslem looked forward to a world-wide conquest, and by means of these holy wars expected to bring all countries under the banners of Islam. To a conquered country the terms were: Embrace Islam, pay tribute, or die. These were harsh terms, but much of their severity is accounted for by the early history of Islam. Broken oaths of allegiance and unprovoked attacks are responsible, to a large extent, for Mohammed's uncompromising attitude. The Koran does state itself clearly on this point, yet no precept found there, when "taken with its context, can justify unprovoked war." At the present day a far more liberal policy is preached toward unbelievers, and the subject is much debated by the learned in Islam. It may be said that the day of these wars "is rapidly passing away, if, indeed, it be not already passed."

Among the prohibitions of the Koran, the most important are those concerning wine and gambling. "They will ask thee concerning wine and lots; answer in both there is great sin and also some things of use unto men; but their sinfulness is greater than their use," and suras 2, v. 216; 5, v. 92, treat of the same. These verses are held by the Moslem to be an absolute prohibition. There might be, however, some doubt as to that if the verses alone, and not their traditional interpretation, were considered. Another prohibition of the Koran is murder. When one believer kills another intentionally he is to remain

MOHAMMEDANISM

in hell forever. (Sura 4, v. 96.) From this fate, however, popular belief rescues him. Should the killing be by accident, there are certain expiations that may be made. There are also many prohibitions in regard to eating, the most important of which is that in regard to swine-flesh. (Sura 5, v. 4.) Such flesh as is eaten must be from an animal killed in a prescribed manner. Laws of marriage, divorce, testaments, and many other civil and criminal laws are founded on the Koran and the Traditions. Mohammed founded not only a religion but a social system as well, wherein the religious and the political life are inseparable. This is the unique feature of Islam.

Mohammed is said to have told his followers that after him 73 sects would arise. His prophecy has been more than fulfilled. It is impossible to give more than a synopsis of a few of the more important divisions of Islam. The two great divisions of sectarian Islam are the Sunnites and the Shiites. Compared with the Sunnite, the Shiite is a small sect, numbering about 15,000,000, while the former has about 145,000,000 adherents. The Shiites believe Ali to have been the legitimate Caliph or Imam, that is, successor of Mohammed, and consequently reject Abu-Bekr, Omar and Othman. Ali, by his double relationship with the Prophet—he was cousin and son-in-law,—as well as by reasons deduced from the Koran, and by traditions assigning him the appointment at the hands of Mohammed himself, should have been Imam. When Omar died, Ali was offered the succession, but as he could not satisfy his opponents that he would rule in accord with their wish he did not receive it till the death of Othman. Ali, however, was soon murdered and his son Hasan abdicated in favor of Muawiyah on condition that he might resume his office at Muawiyah's death. Yazid, however, cheated Hasan of his rights and here starts the Shiite schism. They profess allegiance to a line of 12 Imams, beginning with Ali and ending with Al Mahdi, who disappeared, but is to return. In the meantime they receive religious and legal decisions from a class of learned men, called *Mudjtahids*, a class of authorities not recognized by the Sunnites except in the case of the founders of the four orthodox Sunnite schools. There are numerous subdivisions of the Shiites, but on certain points they agree. Most of them agree in believing the Imams to be of divine nature; the result probably of a tradition credited to the Prophet, wherein he stated that he and Ali were pre-existent, before even the world was formed. The Shiites also observe the ceremonies of Moharram in commemoration of Hasan and Hosein, who were sons of Ali and were both murdered. Their memories are sacred to the Shiites. They differ from the Sunnites in that they credit the first worshippers with the possession of an inspired book or revelation. In the ritual and civil laws also many differences are found. They have a large collection of traditions, a fact often ignored by scholars, misled by the Sunnites' claim to be the Traditionists *par excellence*.

The Sunnites acknowledge the first four caliphs to have been the rightful successors of Mohammed. They are divided into four orthodox sects or legal schools, the first of which was founded by Abu Hanifa. This Abu

Hanifa was a pupil of the sixth Imam of the Shiites; but separated from him to form the school of his name that now predominates in Turkey, Central Asia, and northern India. The second of these schools, that of Ash Shafai, prevails in southern India and Egypt. The third school, that of Malik, has its home in Morocco and Barbary. The last school, that of Ahmed ibn-Hanbal, is found in East Arabia and portions of Africa. The term *Sunni*, which they apply to themselves, is an arrogant title. It signifies "one who is on the path." They claim that they receive the six authentic books of tradition. The main points wherein they differ from the Shiites have already been touched upon, the great body of ritualistic differences must be passed over.

From the school of Ahmed ibn-Hanbal sprang the sect of the Wahhabites, who are named after their founder's father, the founder himself being named Mohammed. This Mohammed, born in Arabia, in the early part of the 18th century, having seen, in the course of his travels, that Islam had departed from its primitive faith, was filled with determination to restore to the religion of Mohammed its early purity. His zeal as a reformer received some temporary setback and he soon became the warrior-prophet. Many converts were made by his missionaries, and the movement grew till Turkey feared for her own safety. In 1803 Mecca, and a year later Medina, was captured. The political power of the Wahhabites was soon destroyed, however, though the principles are still a force in Islam. In India, too, the movement met with a similar fate.

The tenets of the Wahhabites are, practically, those held by the early Moslem. They arrogated to themselves the name of Unitarians, stigmatizing other Moslems as polytheists, inasmuch as the doctrine of the eternity of the Koran meant two eternal beings, therefore two gods. The reverence paid to saints and their tombs aroused to a high degree the antagonism of the Wahhabites. Even the tomb of Mohammed receives no reverence from them, and when they captured Medina, all the rich ornaments were stripped from this sacred spot.

Early in the history of Islam there arose a set of free-thinkers, whose theories are held at the present day. They are known as the Mutazalites and were founded by a Persian, Wasil ibn-Ata, who separated from the school of Hasan al-Basri. The Mutazalites hold that man is the governing factor in his own acts, and is perfectly free to choose; predestination being thus abolished from their tenets. They deny the eternity of the Koran, as well as the attributes of God, believing that each attribute would be a separate, eternal quality, and that, therefore, the unity of God would be destroyed.

Mokanna, "the veiled," is an interesting figure in the history of Islam, owing to his appearance in Moore's 'Lalla Rookh.' This fanatic proclaimed himself God incarnate, and taught that religion consisted in faith, not works. He sent out many missionaries and quite a force collected under his banners. At the advent, however, of the caliph's forces, which were sent to crush him, he deserted his followers and finally committed suicide to escape capture. Persian and Indian sources are responsible for many of his doctrines. He had

MOHAVE DESERT—MOHAVE INDIANS

secret followers for many centuries after his death.

Hasan ibn-Sabah, founder of the order of the Assassins, is a figure well known in history, owing to his connection with the Crusaders. He was at first an adherent of another sect and taught the doctrines of that sect throughout Arabia and Persia; but having won the confidence of a powerful prince, he gained possession of a fortress in Persia. Here he constituted himself grand-master of an order with a large number of minor officials, repudiated many of the tenets of the sect to which he belonged, and began to preach religious devotion and political assassinations. His followers were many throughout Syria and Persia, and he soon announced himself as al-Mahdi, repudiated the Koran, and with it all moral laws. Under the title 'Old Man of the Mountain,' he became a terror not only to the Crusader, but to the Turk as well. They were finally overthrown. Of these sects there are still scattered remnants in Syria and India, and as late as 1866 an English judge at Bombay had to decide a case of disputed succession according to the law of the Assassins.

There is a sect of Mystics in Islam known as the Sufis. They are Moslem in name only, for they deny the necessity of religion, though they admit that its practice is useful as a guide. Their chief doctrine is entirely pantheistic. God is all and is in all, consequently there is no good, no evil, only God. The only occupation of the Sufi is meditation, constant meditation; for by this he is made ready to return to God when his soul is released from captivity. They are divided into numerous sects, some of them believing themselves simply inspired of God, others believing themselves united with God. Their belief, they claim, has always been professed. It obtained its chief hold in Persia, where it has stirred up much trouble. Though banished in 1707, 'the whole country has been so undermined by this insidious heresy that it can almost be said that Persia, throughout its whole extent, contains no real Moslem.'

A few words may be added in regard to Islam's hope of a Messiah, Al-Mahdi, 'the guided one.' He is to come to restore the glory and power of Islam, and has been foretold by Mohammed, in many traditions. According to the Sunnites, he is still to come; but the Shites believe he has already appeared in the person of the twelfth Imam, who having disappeared for a time, is to return. Many have taken advantage of Islam's hope and have announced themselves as the promised Mahdi. The one, to whom at present the eyes of the world are turned, is the head of the brotherhood of as-Sanusi, founded by Mohammed ibn-Ali, as Sanusi, in 1837. This brotherhood advocates reforms of the most sweeping character. The exact letter of the Koran is to be followed in all matters. It is, generally speaking, closely related to the Wahabi movement, yet stricter. The present head, who claims to be the Mahdi, has established himself in the Sahara, and from here he sends out his missionaries. He is collecting arms and quietly making preparations for a holy war that is to transform Islam. 'Sooner or later Europe—in the first instance England in Egypt and France in Algeria—will have to face the bursting of this storm. For this Mahdi is different from him of Khartum and the southern

Sudan, in that he knows how to rule and wait. . . . It will then be for the Ottoman sultan of the time to show what he and his caliphs are worth. He will have to decide whether he will throw in his lot with a Mahdi of the old Islam and the dream of a Moslem millennium, or boldly turn to new things and carry the successorship and the people of Mohammed to join the civilized world.'

In bringing this article to a close, mention must be made of Babism, of which Behaism is the latest development. In the year 1844, Ali Mohammed, in Persia, announced himself as the Bab, or 'gate,' that is, 'the source through which revelation comes.' As the inaugurator of a new dispensation, he set about the reformation of men's lives. Many converts were made and the antagonism of their Moslem neighbors was aroused. Thousands of adherents to the new faith were slain, and in 1850 the Bab himself met this fate. As persecution continued many fled from Persia and finally settled at Akka. In this band of exiles was one upon whom the Bab had conferred the title of Beha Allah, that is, 'the Glory of God.' His declaration that he was the manifestation foretold by the Bab was accepted, and his followers have been styled Beha'is. At his death in 1892, his son, Abbas Effendi, succeeded him and is considered as the third of the divine messengers. The thousands of converts made by this new movement attest its importance. Its missionaries have made converts by thousands. Here, in the United States, its adherents are scattered throughout the larger cities, and Professor Browne, the eminent English authority on Babism, speaking of its influence, states that 'the number and influence of the Babus in Persia is immensely greater than it was 15 years ago, and the conviction which I heard continually expressed this year in Babi circles in Cairo, that in the course of a very short time their religion would reign paramount in their own country, . . . is seriously discussed by European diplomatists and consular officers.'

GEORGE W. OSBORN,
Acting Professor of the Semitic Languages,
New York University.

Mohave (mō-hā'vā) Desert, California, an arid basin chiefly in San Bernardino County, in the southeast, and also extending into Arizona, and forming part of the great Colorado Desert. The Mohave River rising in the San Bernardino Mountains flows through it for some distance, until it disappears in the Mohave Sink.

Mohave Indians, an American tribe of the Yuma family, residing in Arizona and California

MOHAWK—MOHILEV

in the region of the Colorado River. There are upward of 2,000 Mohaves remaining, 600 of whom live on the Colorado River Reservation in Arizona. They are an agricultural people, rank high physically, and are expert makers of pottery and baskets. They practise tattooing and cremate their dead.

Mohawk, a river whose head-waters are in the southern part of Lewis County in New York, which flows south to Rome, then east by south, with many curves, to the Hudson River, which it enters at Cohoes. It is about 150 miles long, and is the largest tributary of the Hudson. In several places along the route there are rapids and falls, as at Little Falls in Herkimer County, Oriskany in Oneida County, and several other places, all of which are noted for manufacturing. The bed of this stream was once much wider than the present channel through which the water passes; in some places the distances between the old banks are from a mile to nearly three miles. The Mohawk Valley is noted for its beauty and the fertility of its soil. The Erie Canal (q.v.) is parallel with the river to Rome. A number of pretty villages and thriving manufacturing towns are on its banks, chief of which from west to east are Rome and Utica in Oneida County; Ilion, Herkimer, and Little Falls in Herkimer County; Fort Plain, Canajoharie, Fonda, and Amsterdam in Montgomery County; Schenectady in Schenectady County, and Mechanicville in Saratoga County. In the "Settlement Period" of the United States, this valley was the main highway from the "East Colonies" to the Great Lakes. It was the home of the most warlike tribes of Indians, the headquarters of the Five Nations.

The first missionaries and the first explorers who left the Hudson River in this part of the United States, journeyed along the country through which flowed the Mohawk.

In this valley, near the Mohawk, Goupil was killed by the Indians, and later Father Joliques (q.v.) was martyred at the place now called Auriesville, on the south side of the river a little east of Fonda. Sir William Johnson built two homes in this valley, one at Fort Johnson about one mile west of Amsterdam, now the railroad station of Akin, the other, Johnson Hall, near the present Johnstown in Fulton County. Much of the early history of the river and valley as related to the whites is connected with the rule of Sir William Johnson and his power over the Five Nations. The centre of wealth and power, in the valley before the war, was at Johnson's home. At the breaking out of the Revolutionary War, an effort was made by both parties to hold possession of the Mohawk. The death of Sir William Johnson, just at the beginning of the War, removed a strong power from the council. His sons and their friends lacked his humanity and wisdom. The union between the British and the Indians resulted in many terrible scenes, among others the massacres of Cherry Creek and Schoharie, the burning of homes, and the taking of many lives in the valley. Burgoyne (q.v.) realized the value of having possession of this valley, and some of the important battles of the Revolution took place along the Mohawk. There were many Tories in the valley; but a large number of the settlers were

always patriots. When the news of Concord and Lexington reached the inhabitants along the Mohawk, many of them loaded into wagons all the grain they could spare and sent the precious cargoes over the rough roads to Boston. When the British determined to end the war the Mohawk Valley, the gateway to the West, was the site chosen. Here the Tories outnumbered the patriots, and the Indians were the allies of the British; but St. Leger's defeat at Oriskany by men under Nicholas Herkimer, filled Burgoyne with despair and fired the enthusiasm and enlivened the hope of the patriots.

Two railroads parallel the river to Rome, the New York Central and Hudson River and the West Shore. The manufacturing industries of the valley which depend largely for motive power upon the water-power of the Mohawk, are extensive and increasing.

Mohawks, a tribe of North American Indians, one of the Six Nations, named collectively by the French the Iroquois. According to their own tradition, confirmed by those of other tribes, they were the eldest people in the confederacy of the Six Nations. They believed that they were liberated from subterranean confinement by Tareya-wagon, who guided them into the valley of the Mohawk; thence they passed to the Hudson and to the sea; but the valley in which they at first established themselves was the seat of their power from the discovery of the country until the American Revolution. Their dominion extended from Lake Champlain to the head-waters of the Susquehanna and the Delaware. Renowned above all the other nations for their skill as warriors, they carried terror wherever they went. Their forays were pursued as far as the Connecticut River, and their influence prevailed among the small independent tribes about the region of the present city of New York. During the French and Indian war they supported Sir William Johnson, following him in his most perilous expeditions, and aiding him in the contests of Lake George and Niagara. After his death they transferred their attachment to his family, and were forced to flee from their ancestral home to Canada, where lands were assigned them on the Grand River. See Iroquois; SIX NATIONS.

Mohegan, mō-hé-gan, or **Monhegan** (mō-hé-gan) Indians, a tribe of North American Indians of the Algonquian family, who formerly lived on the Thames River in Eastern Connecticut. They were at one time united with the Pequots and after the death of Sassacus, the Pequot leader, the remainder of the tribe came to the camp of the Mohegan chief. After the death of King Philip in 1676, the Mohegan tribe was the only important one in that region. They became scattered, some joining the Brotherton Indians in New York. The survivors of this race are so mixed with negro and white blood that they have practically lost their identity.

Mohilev, mō-né-lēf, Russia, a western town and government. The town and capital of the government is on both banks of the Dnieper, 85 miles southwest of Smolensk. The town has spacious streets and a large octagonal square occupied by the principal buildings, among others the palace of the Greek archbishop and the bazaar. It is surrounded by ramparts and is fortified by a citadel on a commanding height.

The staple manufacture is tobacco; and the trade with Riga, Memel, Danzig, and Odessa, chiefly in leather, wax, honey, potash, oil, and grain, is very extensive. Pop. about 45,000, many being Jews. The government, bounded north by Vitebsk, east by Smolensk, southeast by Orel, south by Czernigov, and west by Minsk, is about 210 miles long from north to south by 112 miles broad, and has an area of about 18,545 square miles. The surface, though in the line of watershed which divides Europe into two great basins, is generally flat, and sends its waters chiefly to the South Dwina, but partly also to the Dnieper. The soil is fertile, though very imperfectly cultivated, and the forests, chiefly of oak and fir, cover extensive tracts. The principal mineral is bog iron ore. Both trade and manufactures are limited.

Another Mohilev in the government of Poldolsk, on the left bank of the Dniester, 60 miles east-southeast of Kamenetz, has a population of about 25,000.

Mohldenke, mōl'dēn-kē, Charles Edward, American Egyptologist: b. Lyck, East Prussia, 10 Oct. 1860. He was graduated from Columbia in 1879, and from the University of Strasbourg in 1884. He has published: 'The Egyptian Origin of Our Alphabet' (1886); 'The Trees of Ancient Egypt' (1886); 'The New York Obelisk' (1891); 'The Tale of the Two Brothers' (1898); 'Egyptian Classics' (1900).

Möhler, mē'lēr, Johann Adam, German Roman Catholic theologian: b. Igersheim, Württemberg, 6 May 1796; d. Munich 12 April 1838. He studied theology at Tübingen, became professor there in 1822, and in 1835 was called to a chair in Munich. He was an able doctrinal disputant and did much to arouse the German Roman Catholic Church to new vigor. He wrote 'Unity of the Church' (1825); 'Athanasius the Great' (1827); 'Symbolism, or Exposition of the Doctrinal Differences between Protestants and Catholics' (1832; English version by Robertson), and, a reply to the works of Baur and others against his 'Symbolism,' in 1834 'New Investigations on the Doctrinal Differences between Catholics and Protestants.' He was one of the great theologians of the century. Consult the biographies in German by Friedrich (1894) and Knöpfler (1896).

Mohocks, mō-hōks, The, a club in London, England, also known as the Mohawk Club, which had a scandalous existence in 1711-12. "The avowed design of their institution was mischief." Gay mentions in 'Trivia,' that the Mohawks rolled women in hogsheads down Snowhill, and Swift told Stella of a report that 80 of them had been put into prison; while Lady Wentworth, writing to her son Lord Strafford, says, "I am very much frightened with the fyre, but much more with a gang of devils that call themselves Mohocks." A royal proclamation was issued against them 18 March 1712.

Mohr, mōr, Charles Theodor, American botanist: b. Esslingen, Germany, 28 Dec. 1824; d. Asheville, N. C., 1901. He was educated at the Polytechnic School in Stuttgart and in 1845 made a trip to Dutch Guiana in the interest of botany. He removed to the United States in 1848 and in the following year went to California where his health soon became impaired and he returned to the east engaging in the drug

business in Louisville, Ky., and later in Mobile, Ala. He was employed in various botanical and forestry investigations under the State and United States governments. In 1884 he was appointed botanist of the Alabama Geological Survey and in 1889 became agent of the forestry division of the United States Department of Agriculture. He published: 'The Timber Pines of Southern United States' (1896-7); 'Notes on the Red Cedar'; 'Plant Life of Alabama'.

Mohr, one of the larger of the West African gazelles (*Gazella mohr*), notable especially as the source of the "mohr-stones," or bezoars, derived from these animals and highly esteemed by the Arabs of Morocco and Algeria.

Mohs, Friedrich, frē'drīk mōs, German mineralogist: b. Gernrode 1774; d. Agordo, Lombardy, 29 Sept. 1839. He studied at Halle and the mining academy at Freiberg, in 1811 became professor of mineralogy at Grätz, and later held similar posts at Freiberg and Vienna. He is known as the inventor of a new system of classification for minerals, which regards, in the collecting of species into higher groups, only their external characteristics. He published: 'Die Charaktere der Klassen, Ordnungen, Geschlechter und Arten oder Charakteristik des naturhistorischen Mineralsystems' (1820); 'Grundriss der Mineralogie' (1822-4, in English 1825); etc.

Moldore, mōi'dōr (from the Portuguese, mada d'ouro, literally, coin of gold), a gold coin formerly used in Portugal (from 1690-1722), worth about \$5.

Mohra, mwār, a French name for watered silks. Though made in the same way as ordinary silks, these are of double width, and must be of a stout substantial make. They should also be folded in such a way that the air contained between the folds should not be able to escape easily. They are subjected to an enormous pressure, of from 60 to 100 tons, generally in a hydraulic machine, and the air, in trying to escape, drives before it the small quantity of moisture that is used, and hence is effected the permanent marking called watering, which is for the most part in curious waved lines. The finest kinds of watered silks are known as *moires antiques*. Woolen fabrics to which the same process has been applied are called *moreen*.

Moise, Edwin Warren, American lawyer and soldier: b. in Charleston, S. C., 21 May 1832; d. Sumter, S. C., 8 Dec. 1902. At 15 he left school and after working in a wholesale grocery, studied law. In 1856 he opened a law office. Although opposed to secession, being a Douglas Democrat, and taking the stump against the movement, at the outbreak of the Civil War he organized a company at his own expense, and became its captain. In 1863 he was made major of the 7th Confederate cavalry, and near the close of the War was appointed colonel. He was in the army of Northern Virginia under General Lee, participating in every prominent battle. After the war he settled in Sumter and became a successful lawyer. In 1876 he was elected adjutant and inspector-general on Wade Hampton's ticket, and re-elected in 1878. In 1885 he was presidential elector.

Molpe, Penima, American poet: b. Charleston, S. C., 23 April 1797; d. Charleston 13 Sept. 1880. A personality of much charm, whose charac-

ter is still held in loving memory by all who knew her. Her poetical gifts were early evidenced and her contributions to the press of her day were many. Her hymn book, written for the Charleston Beth Elohim Congregation, is still utilized, and was a pioneer in its field. Despite her blindness in her later years, she continued to write poems, and her home was a place of pilgrimage to a host of admirers.

Moissan, Henri, French chemist; b. Paris 28 Sept. 1852; d. 20 Feb. 1907. He was educated at the Museum of Natural History in Paris, and at the School of Pharmacy; taught in the Higher School of Pharmacy 1879-83, and then (1886) became its professor of toxicology. He isolated and liquefied fluorine, thus winning in 1887 the Lacaze prize from the Academy of Sciences, was transferred to the chair of mineral chemistry in the School of Pharmacy in 1889; and there won great fame by his important experiments and achievements with the electric furnace. In 1892 he made the manufacture of acetylene simple and commercially profitable by his discovery that if carbon and lime be fused in the electric furnace pure calcium will be formed, which makes the liberation of acetylene an easy matter. Much more spectacular was his formation of diamonds in 1893; iron was melted in the electric furnace and saturated with carbon; the furnace at a temperature of more than 4000°C. (that is, more than 7200° F.) was plunged into cold water; the resulting ingot was attacked with hot aqua regia; the iron was thus dissolved and diamonds were disclosed. In 1906 he received the Nobel prize in chemistry. Moissan wrote 'L'Isolément de Fluor' (1886); 'Réproduction du Diamant' (1893); 'Etude complète des Carbones amorphes et des Graphites' (1893).

Moisture. See RAINFALL.

Mokaddasi, mōk'a-dā-sā, Arabian geographer; b. Jerusalem 946. His name is derived from his birth-place and signifies merely 'of Jerusalem.' He was well educated and after a pilgrimage to Mecca in 965, devoted himself to travel. His critical sense makes his work the most trustworthy by any Mohammedan geographer. Two editions of it were published in his life-time; it was edited by De Goeje in 1877; and the part relating to Syria and Palestine appeared in an English version by Le Strange in 1886. Consult Le Strange, 'Palestine Under the Moslems' (1890).

Mokanna, mō-kān'na, Al (HAKIM-BEN-ALLAH), styled the 'Veiled Prophet,' Mohammedan impostor of the 8th century. He hid his face under a veil, a proceeding which his followers ascribed to the splendor of his countenance. He attributed to himself divine powers, and is said, by means of his chemical and other knowledge, to have performed apparent wonders. He gained many followers, so that at last the Caliph Mahdi was compelled to send an armed force against him. He retired to a fortress in Transoxiana, where he first poisoned his soldiers, and then burned himself. His followers continued to pay him divine honors after his death. He is the hero of Moore's 'Veiled Prophet of Khorassan' in the first part of 'Lalla Rookh' (1817).

Moki, mō'kē, or Hopi, a Pueblo tribe of Shoshonians inhabiting north central

Arizona. They are mesa-dwellers, their seven villages, chief of which are Walpi and Oraibi, being situated upon three mesas difficult of access, several hundreds of feet above the desert lands around. The inhabitants of the small village of Hano are of Tanoan stock, and speak a different language, being descendants of refugees from the Rio Grande who migrated in 1680 at the time of the Pueblo rebellion. The Moki are of an industrious and provident nature, successful cultivators, keeping their granaries always well stocked with agricultural produce; they are also noted for their manufactures of pottery, baskets, and blankets, and for their wood-carving. They number about 1,500 and are descendants of tribes who according to the evidence of the ruins scattered around have inhabited the region for several generations. Their traditional ceremonies include the now widely-known 'snake dance,' which is performed with live rattlesnakes carried in the mouth, the 'winter solstice,' and the 'new fire.'

Mola, Pietro Francesco, Italian painter; b. Coldre, near Como, 1612; d. Rome 13 May 1666. At an early age he went to Rome, where he studied painting under Prospero d'Orsi and Giuseppe Cavaliere d'Aspino. He afterward painted at Venice, Milan, and Bologna, in which last city he adopted the style of the local painters, especially Albani. His landscapes are of special excellence. The English National Gallery possesses his 'St. John Preaching in the Wilderness,' and 'The Repose of the Holy Family in the Flight into Egypt.' In the Ravenna chapel of the Church of Jesus at Rome is his 'Peter in Prison' and in fresco 'The Return of Peter to Rome.' He also painted the 'History of Joseph' in the Quirinal Palace. Others of his works are to be seen in the Louvre, the Pinakothek at Munich, and the Dresden Gallery. He was one of the followers of Annibale Caracci, whose manner he reproduced with ease and dexterity, but he was lacking in imaginative depth, while his indebtedness to Albani and Guercino is too evident.

Molasses. See SUGAR.

Molay, Jacques Bernard de, shāk bār-nār de mō-lā, French knight-templar, last master of that Order; b. Burgundy about 1243; d. Paris 11 March 1314. He entered the Order of the Templars in 1265, and became its grand master in 1298. In 1306, while he was in Cyprus busied about raising new troops against the Saracens, he was summoned to France by Pope Clement V. Philip the Fair, fearing, it is alleged, the power of the Order in France, seized Molay and all the knights then resident in France, after receiving them with the greatest kindness, charged the Order with heresy, tried them before a packed court, and found them guilty. Molay was imprisoned and terribly ill-used for more than five years, and then was burned at the stake. The guilt of the Templars is still a disputed historical question. Consult Prutz, 'Entwicklung und Untergang des Tempelherrenordens' (1888).

Moldau, mōl'dow, a river of Bohemia, which rises in the Schwarzwald, on the frontiers of Bavaria, flows first southeast to Rosenberg, where it turns almost due north, and continuing that direction, in a circuitous course, passes

Budweis. After receiving several tributaries, it traverses the town of Prague, and after turning due east, joins the Elbe on the left, 17 miles north of Prague. Its whole course is about 230 miles. It begins to be navigable at Rosenberg, where its north course commences, but at first only for shallow barges. Below Prague it floats vessels of 60 tons. It abounds with fish.

Moldavia, mōl-dā'vī-ə, Rumania, a northern division of the kingdom since 1861, when the union of the former principalities of Wallachia and Moldavia as the Principality of Rumania was proclaimed. See RUMANIA.

Molding, or Moulding, (1) in carpentry, a method of ornamentation by grooved or swelling bands, or forms following the line of the object. There are numerous varieties, as the bead, the astragal, the cavetto, the echinus, the fillet, the fascia, the ovolo, the ogee, the cyma, the recta or reversa, the quirk, the bolection, etc. (2) In mining, the ore found on the top of veins near the surface of the ground. (3) In shipbuilding, giving the correct outline and depth to ship's timbers, etc.; it is one part of the operation of forming. (4) In architecture, a term applied to all the varieties of outline or contour given to the angles of the various subordinate parts and features of buildings, whether projections or cavities, such as cornices, capitals, bases, door or window jambs and heads, etc. There are eight sorts of regular moldings: namely, the ovolo, the talon, the cyma, the cavetto, the torus, the astragal, the scotia and the fillet. See also ANCHITRACUM.

Molé, Louis Matthieu, lō-ē māt-tē-ē mō-lā, French statesman: b. Paris 1584; d. there 3 Jan. 1656. His integrity and fearlessness often resisted the arbitrary measures of the despotic Richelieu; and under the no less ambitious but less vigorous Mazarin, he acquired the esteem of all parties. In 1641 he was appointed first president of the Parliament through the influence of Richelieu, whom he had opposed in the process against the Marshal de Marillac. The disturbances of the Fronde soon after commenced. In this contest of factions Molé defended with equal prudence and sagacity the interests of justice and freedom, as well as those of the court; and when Paris became the theatre of tumults, conducted himself with so much firmness and dignity that his bitterest enemies could not withhold from him their approbation; and even Condé and Cardinal De Retz were forced to esteem him, although his unshaken rectitude and devotion to the welfare of the nation and the safety of the throne frequently frustrated their designs. He was more than once threatened with personal violence by the furious partisans of the Fronde, whom he overawed by his inflexible dignity. In the memoirs of De Retz and other records of the time of the regency of Anne of Austria and Mazarin, Molé's happy influence in the troubled state is everywhere perceptible. His 'Memoirs,' bearing on the stirring events in which he acted so great a part, were published in 1855.

Mole, a small insectivorous mammal of the family *Talpida*. They are related to the still smaller shrews (*Soricida*), from which the typical species may be distinguished by having the external ears so short that they are completely concealed in the fur, the fore feet broad

and shovel-like, the skull provided with an auditory bulla and a zygomatic arch, and numerous other characters. The moderate number of species, belonging to 11 genera, are found only in the temperate portions of the Northern hemisphere. Three species, the common mole (*Scalops aquaticus*), the hairy-tailed mole (*Parascalops breweri*) and the star-nosed mole (*Condylura cristata*) occur in the Eastern United States. A fourth genus (*Scapanus*), with six species, is confined to the Pacific coast. The second is the smallest and is also distinguished by its densely hairy tail and numerous teeth. It is not common and is found chiefly in mountains and about evergreen forests. The star-nosed mole is known at once by the rosette of fleshy processes on the snout, and its larger size; both it and the common mole are abundant in cultivated lands and pastures, the former preferring moist, the latter dry lands. Their habits differ only in details. Moles are eminently fossorial—a mode of life for which they are by structure peculiarly adapted. They construct underground nests lined with soft grasses, from which several passages run off in different directions, and by branching become finally divided into a network of burrows which daily enlarges as the animal searches for the earthworms and insects on which it almost exclusively feeds. They seldom come to the surface except just at noon—a habit which has been repeatedly observed but never explained. The young are born in the nest and some species raise two broods. Notwithstanding its scientific name the common mole shuns water while the star-nosed mole shows a decided predilection for its vicinity and is an expert swimmer. Consult Stone and Cram, 'American Animals' (1903).

Mole, a long pier or breakwater built of masonry and extending into the sea, at times to a distance of a mile or more. In San Francisco Bay are two of these piers, the Oakland Mole and Alameda Mole. The railroad extends to the end of these moles and connects with a line of ferry-boats.

Mole. See NAVUS.

Mole Cricket. This insect is most appropriately named, for it combines the characteristics of the crickets (*Gryllida*), to whose family it belongs, with some of the habits and special adaptations of the moles. The mole-cricket digs winding burrows in the loose soil on the borders of ponds and ditches, raising ridges like miniature mole-hills. In their subterranean wanderings they cut the roots of plants, upon which, as well as upon earthworms and larvae, they feed. A Porto Rican species (see CHANGA) does serious damage to crops. The European mole-cricket lays several hundred eggs in an underground chamber where they are guarded by the female, though many of the young are later devoured by the male. Probably ours have similar habits. The species occurring in the eastern United States are *Gryllotalpa borealis* and *G. longipennis*. They may be recognized by their large brown bodies with a velvet-like covering of fine, close hair, short wing covers, and fossorial front legs, not unlike the great paws of a mole.

Molech. See MOLOCH.

MOLECULAR THEORY

Molecular Theory. in physics and chemistry, the theory which teaches that matter, however homogeneous it may appear to be, is in reality a heterogeneous aggregate of ultramicroscopic particles called "molecules." In a crude form this idea was entertained and defended, even before the Christian era, by certain of the philosophers of Greece and Rome, among whom Democritus and Lucretius may be especially mentioned. The writings of these ancient authorities are of great interest to the historian, and are highly creditable when allowance is made for the state of science at the time they were produced; but they are of necessity too general and too nebulous to be of practical value to the modern physicist, who demands that every theory shall be tested by a critical comparison of its necessary consequences with the facts of observation.

The molecular theory in its present form may be said to be a development of the 19th century; for although the celebrated Swiss mathematician Daniel Bernoulli had suggested, in the 17th century, that gases consist of little molecules moving freely about among themselves, and that gaseous pressure is due to the collisions of these molecules with the walls of the containing vessel, and although other thinkers had made analogous suggestions which helped to prepare the way for the modern theory, it was the work of John Dalton, in chemistry, which gave the first great impetus to the molecular theory, by making it, in some form or other, almost a necessity of thought. Dalton showed (1805) that when substances combine chemically, they do so in certain definite proportions; and he concluded that the facts of this sort which he amassed could be best explained by assuming that matter consists of exceedingly minute particles, or "atoms," each of which has a definite weight, and that when bodies combine chemically, their atoms come together in pairs, or in threes, or fours, or in some other manner, according to the compound formed. (See *Atomic Theory*.) It was shortly afterward observed that when gases combine, they do so in accordance with certain simple volumetric laws. One volume of hydrogen, for example, combines with one volume of chlorine, to form two volumes of hydrochloric acid gas; and two volumes of hydrogen combine with one volume of oxygen to form approximately two volumes of steam-gas. To bring facts of this sort into harmony with Dalton's theory, it was suggested by Avogadro in 1811, and independently by Ampère in 1813, that all gases, when under the same conditions of temperature and pressure, contain the same number of molecules per unit of volume. With these tangible evidences of the molecular structure of matter as an incentive, physicists and chemists set themselves the task of testing, in all conceivable ways, the consequences of such a theory; and in the course of a century of experimental and mathematical study, no fact has been discovered which tends to controvert the fundamental doctrine that matter has a molecular structure. The molecular theory, in some form, is therefore confidently believed to be true by practically all physicists and chemists. The observations which have been made, and which must be harmonized and explained by the molecular theory, are so numerous and so varied, however, that no single set of mutually consistent hypotheses about the

nature of molecules has yet been proposed, which demonstrably explains everything that is known about matter. The chemist and the physicist have worked along lines that are widely different, the chemist investigating the phenomena that are observed when two or more definite substances combine so as to produce one or more new substances, while the physicist has confined his attention chiefly to the mechanical, thermal, electrical and magnetic phenomena that are observed in connection with definite substances whose chemical constitution remains unchanged. It is small cause for wonder (or for criticism), that identical conceptions of the structure of a molecule have not resulted from investigations of such a widely different character; and there is, thus far, no reason for doubting that the chemical and physical conceptions of a molecule will draw nearer together when further study has been given to solutions, to electrolysis, to the thermodynamics of chemical changes, and to other similar subjects whose discussion involves the consideration of changes which are partly chemical and partly physical. There is much evidence, already, to indicate that the "affinity" that chemical substances have for one another is of an electrical character; and when the physicist has arrived at a more definite knowledge of the ultimate nature of electricity, it is possible (and even probable) that this knowledge will go far to clear up the mysteries of chemical affinity, and consolidate chemistry and physics into a single science.

It has been abundantly proven that the "atom" of the chemist and the "molecule" of the physicist are (in general) different things; a molecule being a system formed by the union of a definite number of atoms, combined in a definite way. The molecules of a given substance are the smallest parts into which that substance can be conceived to be divided, without changing its chemical character; while the atoms are the proximate constituents through whose immediate combination the molecule is formed. (The word "proximate" is employed here, because the modern school of physicists to which Professor J. J. Thomson belongs have sought to show that the atoms are composed of still more minute bodies called "electrons," which may be regarded as the ultimate constituents both of the atom and of the molecule.) The molecules of most of the substances that are considered in inorganic chemistry are comparatively simple in structure. Hydrochloric acid gas, for example, is composed of molecules which each contain one atom of hydrogen combined with one atom of chlorine, as indicated by the formula HCl ; and water (at least in the form of steam-gas) is composed of molecules which each contain one atom of oxygen combined with two atoms of hydrogen, as indicated by the formula H_2O . In organic chemistry molecules occur which apparently contain hundreds of constituent atoms, and the comparative stability of such systems is hard to understand, on any hypothesis. The chemical elements consist of molecules, just as compound bodies do; but in any given element the constituent atoms are believed to be all alike.

In the molecular theory as entertained by the physicist, the molecules of a body are commonly considered as small material systems which do not exert any chemical affinity for one another, but which may act upon one another by any of

the so-called "physical forces," such as gravitation, electric and magnetic attraction and repulsion, and elastic pressure due to collision or impact. They are also considered, usually, to possess inertia, and to be subject, in general, to the same laws of motion as apply to the larger bodies of our familiar experience. (See *Mechanics*.) In the "electron theory," to be subsequently mentioned, very different laws of motion are assumed; but the electron theory, although very promising, is not yet thoroughly tested, and is likely to be profoundly modified in many respects before it receives general acceptance, and hence the older doctrines with respect to molecules will be first considered, and the more important features of the newer and less developed theory will be given afterward.

One of the most fundamental assumptions of the molecular theory in its usual form is that the molecules of any one chemical substance are identically alike in all respects. This point was tested by Graham, in the case of hydrogen, by passing the gas through a series of porous partitions, and comparing the final hydrogen, as it issued from the last partition, with the original gas. No difference could be observed, and hence it was concluded that hydrogen, at least, is not a mixture of dissimilar particles; because it is known that a mixture of different gases, whose molecules are different in size, can be partially separated by a diffusion process of this kind. Stas, the great Belgian chemist, investigated this question by determining the atomic weight of a given element as prepared in different ways, and from different sources; and he found that the results obtained under these varying conditions were indistinguishable from one another, even when his work was so accurate that a variation in the atomic weight of the hundredth part of one per cent could hardly escape detection. It cannot be considered to be proved, however, that the molecules of any one substance are alike in every way, in the sense that a hundred standard machine screws are alike, for the question has not yet been tested exhaustively enough. Graham's method and Stas' method furnish evidence to which proper weight should be given, but they cannot be said to be conclusive. Neither can we admit the evidence of the spectroscope to be conclusive, although it indicates that the internal vibrations of a molecule of hydrogen (for example) are performed with the same rapidity, whether the hydrogen is obtained from water, or from organic bodies, or from the gases that are occluded by meteorites, and brought to us from the depths of space. The identity of molecules of the same substance is nevertheless a fundamental assumption of the usual molecular theory, and it will be assumed in the present article.

All matter may be classified, for present purposes, as (1) gaseous, (2) liquid, or (3) solid. (See *Matter*.) Gases are assumed to consist of molecules which are distributed through the space occupied by the gas in such a manner that the average distance from one molecule to the next one is large in comparison with the diameter of any one molecule. The molecules are all believed to be in rapid motion, so that from time to time they collide with one another; and when a collision occurs, it is believed that the molecules that come together rebound again as if they were perfectly elastic bodies. They have motions of rotation as well as of translation, and

the collisions affect both the rotative and the translatory velocities of the colliding molecules. A system composed of a practically infinite number of bodies of this sort will have certain properties which are considered in the article *Gases*, *Kinetic Theory* of, and shown to be in general agreement with the properties of the actual gases of nature. The molecules of a gas undoubtedly attract one another under ordinary circumstances; but it is assumed that they are so far apart during the greater part of the time, that the attractive forces that exist do not have any great effect upon the motions of the system as a whole. The path of a molecule of gas, between two successive collisions, is called the "free path" of the molecule, and is believed to be sensibly straight, owing to the high velocities that the molecules of a gas have on the average, and the (assumed) fact that the attractive forces are unimportant at distances comparable in magnitude with the mean "free path." It may be shown by the methods of the kinetic theory of gases that the average velocity of a hydrogen molecule, at atmospheric pressure and at the freezing point of water, is about 5,371 feet per second. The average velocities of several other familiar gases, under the same conditions, are as follows: Oxygen, 4,994 feet per second; nitrogen, 4,488; carbon monoxid, 4,491; carbon dioxide, 4,189. Clausius deduced, from the kinetic theory of gases, a formula giving the mean free path of a gas in terms of the temperature of the gas, its density at 32° F. and under a pressure of one atmosphere, and its "coefficient of viscosity." (See *Viscosity*.) With the experimental data that have been obtained for the coefficients of viscosity of the more familiar gases, the following values of the average free paths of the molecules of these gases are obtained from the formula in question, the unit in each case being the ten-millionth part of an inch, and the gas being supposed to be exposed to a pressure of one atmosphere, and a temperature of 32° F.: Hydrogen, 67; nitrogen, 36; oxygen, 38; carbon monoxid, 36; carbon dioxide, 35. If the average speed of translation of a gaseous molecule, in inches per second, be divided by the length of the average free path in inches, the quotient is the number of collisions that the molecule experiences, on an average, per second. In this way it may be shown that in hydrogen at the density and temperature given above, each molecule experiences, on an average, 10,040 million collisions with its neighbors per second. The corresponding numbers of collisions for the other gases (in millions per second) are as follows: Nitrogen, 5,021; oxygen, 4,410; carbon monoxid, 5,014; carbon dioxide, 5,741. The length of the free path of a given gas is increased, when the density of the gas is diminished, in the exact inverse ratio of the change in density. In an exhausted tube containing hydrogen, for example, at a density one one-millionth of the density assumed above, the mean free path of the molecules would be a million times as great as the value given for hydrogen at the normal density,—that is, the free path at this particular exhaustion would be 6.7 inches, so that the molecules would travel, on an average, over six inches between successive collisions. As the kinetic theory of gases assumes that the molecules collide with one another after traveling distances that are

MOLECULAR THEORY

negligible in comparison with the dimensions of the whole mass of gas under consideration, its conclusions, when applied to gaseous masses in which this condition is not fulfilled, must be received with proper caution. Clausius' formula, for example, is itself doubtful when applied to the extreme case in which the density of the hydrogen is only a millionth of the normal value. It is certain, however, that the free paths of gas molecules at such high exhaustions are to be measured in inches, and it is also certain that the pressure is not necessarily equal in all directions in vacua of this degree of perfection, since it is by means of the incessant collisions that this equality of pressure is brought about at ordinary densities. For these reasons (among others) Sir William Crookes considered that highly attenuated gases, in which the pressure is a millionth of an atmosphere or less, should be considered as constituting a "fourth state" of matter, essentially distinct in its properties from the three states that are commonly recognized. He also devised the radiometer and other instruments, to show the reality of the differences of pressure that can exist in high vacua. In recent years it has become increasingly probable that in certain forms (at any rate) of the apparatus devised by Crookes,—in those forms, namely, in which "cathode rays" are generated by the action of powerfully excited electrodes,—the mechanical effects that are observed are not due directly to the motions of the gas molecules themselves, but rather to the motions of the free "electrons" of which these molecules are ultimately composed, and which are liberated by the disintegration of the gas molecules under the influence of the powerful electric discharge. Crookes himself appears to have held views not essentially different from this, though at the time they were stated they were clothed in language that was necessarily rather indefinite, since the electron hypothesis had not then taken form. (See ELECTRON; RADIATION.)

In liquids, the molecules are supposed to be so near together that the attractive forces that they exert upon one another are powerful at all times. The kinetic theory of liquids is very imperfectly understood, but it is considered certain that collisions occur among the molecules just as they do in gases, and that the colliding molecules rebound from one another like perfectly elastic bodies. In liquids, however, there is nothing strictly analogous to the "free path" in gases; for the liquid molecules are always exposed to attractive forces of considerable magnitude, and hence in the intervals between successive collisions they describe paths that are everywhere markedly curved. There is, doubtless, as great a variety of velocities among the molecules of a liquid as among those of a gas, but the law of distribution of velocities among liquid molecules has not yet been determined, on account of the mathematical difficulties that are involved, and which have thus far proved insuperable. Admitting the fact that the velocities of the molecules are unequal, let us consider what would happen at a free surface of the liquid, assuming for the moment that above this free surface there is a boundless vacuum. A molecule that is well within the liquid is attracted, on the whole, equally in all directions. A molecule at the surface, however, is attracted only downward. Hence it is

evident that when a molecule, in the course of its wanderings, comes to the surface, the possibility of its escape from the liquid depends upon the magnitude of the vertical component of its velocity. If this vertical component is sufficient to carry the molecule beyond the range of sensible attraction of the liquid, the molecule will pass away indefinitely into the space above. On the other hand, if the vertical component of its velocity is not sufficient to carry the molecule beyond the range of sensible attraction of the liquid, it will rise into the vacuous space only a short distance, its upward velocity growing less and less, under the influence of the downward attractive forces, until it vanishes altogether; after which the molecule will begin to fall back, and it will finally plunge into the liquid again. From the slowness with which free evaporation takes place, we must conclude that by far the greater part of the molecules that start upward fall back into the liquid. Those that do escape by reason of their great velocities carry off more than their equitable share of the kinetic energy of the molecules of the liquid, and this causes the average kinetic energy of the liquid, per molecule, to grow continually less. In other words, free evaporation causes a reduction of the temperature of the mother liquid. When the liquid is enclosed in a containing vessel of finite volume, the phenomena are somewhat different, after the evaporation has proceeded for a time. If the space above the liquid is vacuous at the outset, the evaporation, at the first instant, takes place precisely as before. Of the molecules that come to the surface of the liquid, those that are moving most rapidly in a vertical direction fly off as in the case previously considered; but they can no longer pass away indefinitely into space. They are now retained in the vessel, in which they will accumulate, constituting a gas or vapor whose density will go on increasing until a certain limit is reached. The molecules composing this vapor will travel in every direction, precisely as they do in other gaseous bodies. Many of them, therefore, will plunge back into the liquid again, and become an integral part of it once more. Now the number of molecules that leave the mother liquid in a given time will be quite independent of the density overhead; but the number that fly back into it again, in a given time, will be greater, the greater the density of the vapor. At the beginning of the evaporation the vapor will be quite rare, and the number of molecules that fly off in any given time will greatly exceed the number that return during that time. The density of the vapor will therefore increase. After a certain interval (exceedingly short as measured by ordinary standards), the density of the vapor will become so great that the number of molecules plunging back into the liquid in a given time will become sensibly equal to the number that fly off from it in the same time. When this adjustment becomes perfect, the density of the vapor will no longer increase. It is then said to be "saturated," and its density will remain constant until the temperature of the system is altered. If the temperature be now raised, all the molecules will be accelerated, and hence more molecules will plunge from the vapor into the liquid in a given time than before, and more molecules will also come to the surface of the liquid from the interior. Furthermore, of the increased

MOLECULAR THEORY

number of molecules that emerge from the interior of the liquid, a larger proportion than before will have velocities exceeding the critical velocity that a molecule must have in order to escape from the attraction of its fellows. Hence, on the whole, the density of the vapor will increase, approaching a new limit at which the number of in-coming and out-going molecules will again become equal. It follows, therefore, that for any vapor in contact with its liquid, there is a definite density corresponding to each temperature. The existence of a critical point ($q.v$) may be explained in a similar manner, by considering the average kinetic energy that a molecule must have in order that it may be able to pass away from the attraction of other molecules in its immediate vicinity. A stone thrown upward by the hand does not proceed far before the attractive force of the earth annuls its velocity and causes it to fall back again. A rifle will project a ball far higher, but the ball will eventually fall back, just as the stone did. With a good modern cannon we can throw a projectile several miles into the air,—and still it falls back. But we might conceivably project one with such a speed that it would leave the earth forever. It may be shown, in fact, that if the retarding action of the air is omitted from consideration, an initial vertical speed of 36,700 feet per second would be quite sufficient. With this much premised, conceive two molecules of a gas to be in contact, and let a sudden impulse be given to one of them, to drive it away from the other one. If the impulse is small enough, the disturbed molecule will only travel a short distance, and will then fall back to its original position; but we may give it such a speed that the attractive force of the fixed molecule will fail to bring it back, and in this case it will travel onward indefinitely. Now, just as in the case of the cannon-ball and the earth, there must be some intermediate initial speed that will be just sufficient to separate the two molecules under consideration. We may call this the "critical velocity," and we may say that if the molecules of a gas are moving about so that, on an average, when two of them collide they have a relative velocity greater than this critical value, the gas in question cannot be liquefied by pressure alone; for even if its molecules were forced almost into absolute contact with one another, their velocities would be sufficient to separate them again indefinitely, as soon as the pressure was removed. From this, and from the relation between temperature and molecular velocity in gases (see GASES, KINETIC THEORY OF), it follows that for every gas there is a temperature above which the gas cannot be liquefied by any pressure whatever.

Very little is known about the molecular constitution of solid bodies. The most obvious property of a solid is, that it preserves its shape so long as it is not acted upon by external forces. Moreover, when such forces are applied, the solid indeed becomes deformed, but it eventually regains its original shape after the forces have been removed, provided they did not exceed a certain magnitude called the "elastic limit," which is peculiar to the solid under examination, and to the way in which the forces were applied. We are obliged to conclude, from these facts, that the molecules of a solid are not free to roam about, but that some or all of them have determinate mean positions about

which they may oscillate and rotate, but from which they never permanently depart except when constrained to do so by an external force great enough to overcome the internal forces (whatever they may be) which normally determine the mean positions of the molecules. Some solids are brittle toward forces that are suddenly applied to them, although they yield slowly, and after the manner of a viscous fluid, to smaller forces that are applied continuously for a long time. A mass of cold pitch, for example, may be easily shattered by a blow, and yet when allowed to rest for a sufficient time upon an inclined plane, it yields gradually to the relatively insignificant force of gravity, loses its shape, and very slowly flows down the plane. It is evident that solids of this character must have exceedingly complicated structures. Maxwell suggested that they consist of two kinds of molecular groups, of which one is more stable than the other, and he supported his argument with considerable ingenuity. His views were purely speculative, however, and it appears to be fairly evident that the first advances that we make toward a good understanding of the molecular structure of solids must be based upon a study of bodies of crystalline nature, like quartz and iron.

It is certain that in crystals there is some definite regularity of orientation, either in the molecules themselves, or in their motions; and it may be fair to assume that this regularity is of such nature that any given molecule, in its vibratory excursions, never passes outside of a certain imaginary ellipsoid, which may be conceived to be described about the mean position of the molecule. Crystals may then be regarded as aggregates of such ellipsoids, piled up in such a way that the corresponding axes of all of them are either parallel throughout the mass, or at least arranged in accordance with some definite geometrical scheme. When a substance crystallizes, either from solution or from a state of fusion, the ellipsoids that bound the crystal molecules must necessarily arrange themselves so that the potential energy of the resulting solid is as small as it can be, consistently with the conditions under which the solidification takes place. For the sake of illustrating the application of the molecular theory to the explanation of crystal structure, we may assume the ellipsoids to be simple spheres, and we may also assume that the potential energy of the system is least when the spheres are grouped together as closely as possible. The problem of crystal structure is then reduced, in its geometrical aspect, to the simple one of finding out how to pack the greatest number of equal spherical balls into a given space; and in order to properly comprehend the principles that are involved, a little patient experimentation with a liberal supply of buckshot or spherical bullets is desirable. It will be found that pyramids can be built with them, apparently in several ways; though the internal structure of the pile is really the same in all cases. The slant faces of these pyramids correspond to the plane faces of the actual crystal. When a crystal is forming (say by deposition from a solution) we are to conceive that a continuous series of exchanges is going on, all over its surface. Molecules of the dissolved substance are caught by the attraction of the growing crystal, but, on the other hand, molecules of the solidified crystal are com-

MOLECULAR THEORY

tinually passing into solution again; and the gradual increase in size of the crystal is due to the fact that in a unit time more molecules are caught by it than are lost again. Suppose, now, that the surface of a partially formed crystal is injured slightly, and let us represent the injury, in our shot pile, by removing a few of the shot from one of the faces of a pyramid. A molecule that happens to lodge in the injured place will be in contact with more of the other attracting spheres than it would touch if it were to collide with one of the uninjured parts of the crystal, and it will therefore be held more firmly in place. In the exchange of molecules between the crystal and the solution, a molecule thus embedded will be less likely to be torn away again; and this action tends to preserve the flatness of the faces of the growing crystal, and to cause the repair of damaged places to proceed with greater rapidity than the growth along normal, uninjured parts.

Attempts have been made to unify our knowledge of matter, by the comparison of what are known as "corresponding states" of different kinds of matter. The general conception of "corresponding states" is difficult to define, and the sense in which the phrase is used may be best illustrated, perhaps, by the following simple illustration. Two gases which are at their respective critical points (see CRITICAL POINT) may be considered to be in corresponding states. Let P_c , V_c , and T_c be, respectively, the critical pressure, the critical volume of a unit mass, and the critical temperature (on the absolute scale) of one of these gases, and let the pressure, volume and absolute temperature of this same gas in any other state be represented by P , V and T . Instead of measuring these last quantities in the usual units, let them be expressed as fractions of the corresponding critical values; so that the pressure, volume and temperature of the gas will be respectively P/P_c , V/V_c , and T/T_c , as expressed in the new units. In the same manner, let the pressure, volume and temperature of the second gas be expressed in terms of the critical constants of the second gas. Then the two gases are said to be in "corresponding states" whenever the pressure, volume and temperature of the first gas are respectively equal to those of the second one, when all are expressed in this manner. The idea of "corresponding states" was discussed at some length by Van der Waals (*'Continuité des Etats Gazeux et Liquides'*), and has also been employed by Gibbs and others for various purposes.

It has been said, above, that the molecules of bodies attract one another. We do not know much, however, about the mechanism by which the attraction makes itself felt, nor even about the law in accordance with which the attraction falls off with increasing distance. It would be natural to assume it to vary as the inverse square of the distance, but it is usually held that there is good evidence that it falls off more rapidly than this, as the distance increases. Maxwell assumed, in certain of his writings, that the attraction varies as the inverse fifth power of the distance, but he apparently chose this law merely because it rendered certain of his equations more manageable. William Sutherland has advanced reasons for believing that the inverse fourth power is more nearly correct, for the distances that are commonest between the molecules of gases under ordinary

conditions of density. We do not even know that the forces between molecules are "central,"—that is, we do not know that the attractive force exerted by a molecule tends toward a definite point within the substance of the molecule. Helmholtz showed, in a paper published in 1847, that if the universe consists of smooth spherical molecules, which attract one another only by forces that are directed toward their centres, the great fact of the conservation of energy is a necessary consequence (see ENERGY); but unfortunately we now have good reason for believing that molecules are not bodies of this sort, and hence the principle of the conservation of energy must be regarded as a mere fact of observation. The distance at which the attractive force exerted by a molecule is still sensible is of course indefinite, depending as it does upon the delicacy of the means that are employed for the detection of the force. Maxwell showed that a soap-bubble would become unstable when its thickness is reduced until it is only equal to the radius of sensible molecular attractive power; and as Reinold and Rüchker have shown that soap-films become unstable at a thickness of about one two-millionth of an inch, we may take this as a rough estimate of the limiting distance at which molecular attractive power ceases to be sensible.

The aggregate volume of all the molecules in a given mass of gas may be obtained, to a rough approximation, by several methods, among which we may mention the so-called "characteristic gas equation," which exhibits the relation between the pressure, density and temperature of a gas. Equations of this sort have been given by Van der Waals, Clausius and others, and in them a term occurs whose value depends upon the proportion that the bulk of the actual molecules bears to the total bulk of the gas that they constitute. The numerical magnitude of this term may be determined by experiments upon the variation of the pressure of a gas with temperature and density, and hence the aggregate bulk of all the molecules may be determined in a somewhat approximate manner. Roughly, it may be said that at ordinary densities, the actual total bulk of all of the molecules of a gas is from the thousandth to the ten-thousandth part of the bulk of the entire gas. Clausius has shown, from the kinetic theory of gases, that the diameter, D , of a gas molecule may be expressed in terms of the mean free path (L) and the proportion (B) of the total bulk of the gas that is actually occupied by molecules, by means of the simple equation $D = 8.5 LB$. When we know L and B it therefore becomes easy to compute the diameter of a molecule; but it must be remembered that the phrase "diameter of a molecule" has no very definite meaning at present, and cannot have until we know much more about the nature of molecules. In fact, to ask how big a molecule is, is much like asking "How big is a crowd?" Clausius' equation, when applied to the existing data for B and L , indicates that the diameter of a gaseous molecule is something like the fifty-millionth part of an inch. Treating the molecule as a sphere, we may then show that the number of molecules in a cubic inch of gas at 32° F. and one atmosphere of pressure is approximately 100 millions of millions of millions, though this figure can be regarded only as the roughest kind of an approximation.

We know practically nothing of the actual nature of a molecule. Some of the assumptions that have been made by mathematicians are explained in the article GASES, KINETIC THEORY OF; but it is not probable that these assumptions correspond in the least degree with the actual facts. Lord Kelvin has advanced the idea that they may be similar in structure to the smoke-rings that are blown by skilful smokers; that is, he has suggested that the molecules are vortices in the ether which is known to fill space. This theory is quite suggestive and helpful in some respects, but it can hardly be regarded as more than an interesting though improbable speculation. The electron theory of J. J. Thomson is more in favor at the present time (see ELECTRONS), although it has not yet been fully tested. According to this view, molecules are built up of far smaller elementary corpuscles, or "electrons," about 1,000 of these being required for a hydrogen atom, 16,000 for an oxygen atom, 200,000 for a mercury atom, and so on, the number being proportional to the atomic weight of the element under consideration. These electrons are supposed to be all alike, and to be practically nothing but tiny detached charges of electricity, floating through the ether. They are believed to exist practically in the free state in the cathode rays that are visible in Crookes' tubes. According to this view, chemical affinity is merely an electric force acting between atoms, and the inertia of a molecule is merely a mathematical consequence of the extremely rapid motions of the electrons of which the molecule consists. It may be proved, indeed, that an electrified body in rapid motion possesses an apparent mass that is greater than the mass as measured by the ordinary methods of mechanics. At any ordinary velocity, this apparent increase in mass is probably not measurable; but at the high velocities which the electrons (for other reasons) are believed to have, the "pseudo-mass" may easily become as great as the real mass; and the present tendency is, to regard what we have called the "real mass" of a molecule as having no existence, and to attribute the mass of a body entirely to the enormous velocities of its constituent electrons.

Consult: Meyer, 'Kinetic Theory of Gases'; Kelvin, 'Popular Lectures and Addresses,' Vol. I.; Risteen, 'Molecules and the Molecular Theory.' J. J. Thomson's electron theory is too recent and too incomplete to find a place, as yet, in such treatises, and for this the current scientific periodicals must be consulted. See, however, Larmor's 'Matter and Aether.'

A. D. RISTEEN, Ph.D.,

Editorial Staff, 'Encyclopedia Americana.'

Mole'skin, a fabric so called from its being soft like the skin of a mole. It is a strong twilled cotton fabric, cropped or shorn before dyeing. In the United States the word is also applied to the padded breeches worn by football players.

Molesworth, Sir Gifford Lindsay, English civil engineer: b. Milbrook, Hampshire, 3 May 1828. He studied at King's School, Canterbury, and at the Putney College of Civil Engineers; was apprentice to the chief engineer of the London and Northwestern Railway; was employed at Woolwich Arsenal during the Crimean war; went to Ceylon 1859, becoming

director-general of railways there in 1867; and in 1871 was appointed consulting engineer to the government of India. He received decorations for his services in the Afghan and Burma wars, and retired in 1889. He wrote a standard 'Pocket-Book of Engineering Formulae,' various other works on technical subjects, 'Imperialism in India' (1885); 'Reason and Instinct in Ants' (1886), and a prize essay 'Silver and Gold' (1891).

Molesworth, möl'wërth, Mary Louisa Stewart, English writer of juvenile stories: b. Holland 1842. In 1861 she was married to Major Molesworth of the Royal Dragoons. Her earlier writings were novels under the pen-name 'Ennis Graham'; she wrote her first children's stories about 1875 and gained an immediate success. Her more famous titles are: 'Carrots' (1876); 'The Green Casket' (1890); 'Meg Langholme' (1897); 'The Laurel Walk' (1898); 'The Grim House' (1899); 'This and That'; 'The House that Grew,' and 'Peterkin.' Among her later novels are 'Hathercourt Rectory'; 'The Red Grange.'

Molesworth, Sir William, English politician: b. London, England, 23 May 1810; d. there 22 Oct. 1855. In 1823 he succeeded as 8th baronet; studied at Cambridge, but was obliged to leave because of his having challenged a tutor to a duel, and completed his education at Edinburgh, and in Germany. He was a member of Parliament for East Cornwall 1832-7, for Leeds 1837-41, and for Southwark from 1845 till his death. In 1853 he became first commissioner of public works under the Earl of Aberdeen, and in 1855 was colonial secretary under Palmerston. The close friend of Bentham and James Mill, he was looked upon as the parliamentary exponent of the "philosophical Radicalism." He founded the 'London Review' in 1835 and the next year merged it in the 'Westminster Review' which he had purchased, and contributed many articles to this organ of radicalism. He edited the complete works of Hobbes in 16 volumes and published them at his own expense. He is best known as having drawn public attention to the abuses connected with the transportation of criminals, and as having pointed out the maladministration of affairs in the colonial office, investigated the relations between the imperial government and the colonial dependencies, and expounded the true principles of colonial self-government.

Molfetta, möl-fët'tä, Italy, a seaport city in the province of Bari, on the Adriatic, 13 miles northwest of the city of Bari. It has a magnificent cathedral, several other churches, a college; manufactures of linen and saltpeter; a harbor, well sheltered except on the north; and a considerable trade in corn, oil, and fruit. Pop. about 44,000.

Molière, mö-lä-är (assumed name of JEAN BAPTISTE POQUELIN, zhôn bâ-têst pôk-ë-län), French dramatist: b. Paris 15 Jan. 1622; d. there 17 Feb. 1673. His father was *valet de chambre* and upholsterer to the king. When his father had become debilitated he had to discharge his office about the person of Louis XIII. In 1641 he accompanied the king to Narbonne. The French theatre had at that time begun to flourish through the talents of the great Corneille; and young Poquelin, who had imbibed a strong passion for the stage, now formed a

company of young persons of similar tastes, exchanged his family name for that of *Molière*, and resigned the office of his father. His company soon became distinguished; and we find him at the head of a strolling troop, which acted 'L'Etourdi' at Lyons in 1653. This is the first comedy written in verse by Molière. The truth of the dialogue, the inexhaustible skill of a valet continually employed in rectifying the blunders of his master, the interest of the situations arising therefrom, have kept this piece on the stage notwithstanding the want of connection between the parts. Molière gained equal applause as a poet and an actor, and drew all the spectators from another company at Lyons. The art of representing character and manners on the comic stage was reserved for Molière. 'L'Etourdi' was acted with equal applause in Béziers. Here the Prince of Conti, who had known Molière at school, had just assembled the estates of Languedoc. He received the poet as a friend, and entrusted him with the charge of amusing the town and the assembly. 'Le Dépit Amoureux' and 'Les Précieuses Ridicules' were brought forward in the theatre of Béziers. In 'Le Dépit Amoureux' the incidents are better arranged than in 'L'Etourdi.' In the actions of the personages a genuine comic vein is exhibited, and their language displays much spirit and humor; but the plot is too complicated, and the *dénouement* not sufficiently probable. The plot in the 'Précieuses Ridicules' is more simple. A delicate satire on the prevailing affectation of the character of *bel esprit* and of a romantic style, on the pedantry of learned females, and affectation in language, thoughts, and dress, is the object of this comedy. It produced a general reform when it was brought forward in Paris. The spectators laughed, recognized themselves, and applauded. Louis XIV., well pleased with the performances of Molière's company, made it his own company, and gave its director a pension of 1,000 livres. 'Sganarelle, ou le Cocu Imaginaire' appeared in 1660. This piece also contains a fund of sportive humor, and keeps the spectators continually amused. Censure was not silent on its appearance, but was not listened to. 'Don Garcie de Navarre,' in imitation of the Spanish, was criticized with more justice. It is a cold attempt at a more elevated style. 'L'Ecole des Maris' the idea of which is drawn from the 'Adelphi' of Terence, contains a simple and entertaining plot and a natural *dénouement*. The theatre still resounded with the applause with which this piece was received, when 'Les Fâcheux,' projected, executed, and committed to memory by the actors within a fortnight, was performed at Vaux at the residence of Fouquet, intendant of finances, in the presence of the king and court. This comedy is almost destitute of plot, but the intention was to interest the spectators by the multiplicity of characters, the truth of the portraits, and by the elegance of the language. It is said that the king, on going away from the first performance, happening to see the Count Soyecourt, a tiresome narrator of his exploits in the chase, said to Molière, "There is an original that you have not copied." In 24 hours the scene of the hunter was inserted; and as Molière was not acquainted with the terms of the chase, he requested Soyecourt himself to explain them to him. 'L'Ecole des Femmes' (1662) met with critics, who, overlooking the

art which prevails in the management of the inferior personages, and in the natural and quick transition from one surprise to another, and undervalued upon some negligences of style. Molière answered them by his spirited 'Critique de l'Ecole des Femmes.' The 'Impromptu de Versailles' was a reprisal occasioned by an attack of Boursault, who had written a piece against him, entitled 'Le Portrait du Peintre.' The court was much pleased in 1664 with 'La Princesse d'Elide,' a comic ballet, prepared for an entertainment given by the king. Another ballet, 'Le Mariage forcé,' is drawn from Rabelais. 'Don Juan, ou le Festin de Pierre,' excited much reprehension by the impiety of some of the expressions placed in the mouth of the profligate hero. Molière retrenched the objectionable parts in the second representation. 'L'Amour Médecin' is one of the over-hasty works which are not to be strictly criticized. It was written, studied, and represented within five days. In this Molière for the first time attacks the physicians. His great piece, 'Le Misanthrope,' was but moderately well received at first, but in the sequel was justly considered as one of the finest productions of modern comedy. It has been more admired in the closet than it has pleased on the stage—the reason Voltaire believes to be because the plot is delicate and ingenious rather than lively and interesting; because the dialogue, with all its beauty, does not always seem necessary, and therefore retards the action; and because the *dénouement*, though skilfully introduced, leaves the spectator unexcited. In 1665 appeared 'Le Médecin malgré lui,' a farce full of humor. 'Le Sicilien, ou l'Amour Peintre,' is a short piece which pleases by its grace and gallantry. But his reputation was carried to its highest summit when 'Le Tartuffe' appeared. In this hypocrisy is fully unveiled, the characters are equally various and true, the dialogue is elegant and natural, the *dénouement* alone is unsatisfactory. An impious and obscene farce, entitled 'Scaramouche,' having been represented at court, the king said to the great Condé, as he was leaving the theatre in his company, "I should like to know why the people, who are so much scandalized at Molière, say nothing about 'Scaramouche.'" "The reason is," replied the prince, "that 'Scaramouche' ridicules only God and religion, about which these people care nothing, while Molière's piece ridicules themselves." In 1668 Molière published his 'Amphitryon,' a free imitation of Plautus. With the exception of a tedious scene between Jupiter and Alcmena, nothing can be more humorous. 'L'Avare' (the Miser), an imitation of the 'Aulularia' of Plautus, is, in the leading character, a little overdone; but the multitude is only to be struck by strong traits. 'George Dandin, ou le Mari confondu'; 'Monsieur de Pourcœur'; 'Les Fourberies de Scapin,' are rather amusing than instructive. 'Le Bourgeois Gentilhomme,' though mixed with some buffooneries, is full of power. Molière bestowed more care on his 'Femmes Savantes,' a witty satire on affected taste and pedantic learning, which at that time prevailed in the Hôtel de Rambouillet. The incidents are not all well connected, but the subject, dry as it may be in itself, is exhibited in a truly comic form. The development is admirable, and has been a hundred times imitated. The same is true of the 'Malade imaginaire,' in which the quackery and

MOLINA - MOLINE

pedantry of the physicians of the times are fully delineated. With this piece the author concluded his career. He was indisposed when it was performed, and the exertion with which he played produced convulsions, followed by a hemorrhage, and he died after the lapse of a few hours. The archbishop of Paris at first refused him burial; but the king himself insisted on it, and he was interred in the cemetery behind the chapel of St. Joseph, Rue Montmartre. In 1792 his remains were transferred to the Museum of French Monuments, whence in 1817 they were removed to Père Lachaise.

Molière is the true father of French comedy. His works may be considered as a history of the manners, fashions, and tastes of his times, and as the most faithful pictures of human life. Born with an observing mind, skilful in catching the outward marks of the passions and emotions, he took men as they were, and, with singular felicity, exhibited the most sacred recesses of their hearts, and the tone, the action, and the language of their various feelings. Of all who have ever written, Molière is the one who has best observed men without seeming to do so. His knowledge of human character seems to have come by intuition. In his domestic relations Molière was not fully happy; he who made merry on the stage with the weaknesses of other men could not guard against his own weakness. A violent passion induced him to marry the daughter of the actress Béjart, and he thereby incurred the ridicule he had so often cast on husbands of a disproportioned age. As an actor Molière was not to be surpassed in high comic parts, such as Arnolphe, Orgon, Harpagon, etc. An edition of Molière published at Paris in 1838 gave the actors' names after the *dramatis personæ*, from which we learn that Molière always played the principal comic parts himself. Among the last and best editions are those of Mouton (8 vols. 1882); A. France (7 vols., 1876-91); and Desfois and Menard (11 vols., 1873-93). Consult biographies by Lotheissen (1880); Mahrenholz (1881); Molnd (1886); Larroumet (1886); Baluffe (1886); Menard (1889); Desfois (1900); Schneegans (1901). Also Lacroix, 'Bibliographie Moliéresque' (1875); Louvel, 'Points obscurs de la Vie de la Molière' (1877); Livet, 'Langue de la Langue de Molière' (1895-7).

Molina, mō-lē-nā, Alonso de, Spanish missionary: b. Escalona, Spain, about 1510; d. Mexico 1584. He accompanied his parents to San Domingo, and in 1523 went to Mexico, where he learned the Aztec language and acted as interpreter to the Franciscan monks, whose order he subsequently joined and engaged in missionary work, in which he was very successful. He was superior of the province of Santo Evangelio, and his books are among the earliest printed in America. Among them are 'Diccionario de la lengua Castellana y Mexicana' (1555); 'Arte de la lengua Mexicana' (1578); and several works in the Aztec language.

Molina, Juan Ignacio, hoo-ān' ēg-nā'sē-d, Chilean historian: b. province of Talca, Chile, 24 June 1737; d. Bologna, Italy, 12 Sept. 1829. He was educated in the Jesuit College at Santiago, and entering the order after its expulsion from America in 1767, settled in Italy. After 1774 he lived at Bologna, teaching and writing. He published 'Compendium of Chilean His-

tory' (1776); 'Essay on Chilean Natural History' (1782); 'Essay on Chilean Civil History' (1787), the last-named being translated into several languages, including English, etc.

Molina, Olegario, Mexican statesman: b. Bolonchenticul, Campeche, 1843. He was educated in the Seminary of San Ildefonso, Merida, where he subsequently became a professor. Later he founded in Merida a school of primary and secondary instruction, and still later a benevolent society known as 'The Youth.' While still young he established and conducted two journals, *La Guirnalda* and *Yucatan*. He was then elected to the Merida city council and later served one term in the national congress. He then returned to Yucatan and served as fiscal magistrate of the superior court of the state till he retired to enter the field of business. In 1877 Molina took charge of the construction of the first railway in Yucatan,—the line which connects the cities of Merida and Progreso,—completing it in two years notwithstanding most discouraging conditions, and afterward and until 1881 operating it as manager. In the latter year he organized the present commission and banking house of O. Molina & Co. In 1902 he was elected governor of his state for the four years ending 1906, when he was re-elected. Because of ill health he retired from the governorship at the end of the first year of his second term. In March 1907 he was appointed by President Díaz to the cabinet position of secretary of Fomento, colonization and industry.

During his five years' service as governor Mr. Molina introduced and successfully carried through many important public improvements and reforms in the several departments of government, greatly advanced the cause of education, stamped out yellow fever at Merida and built a fine general hospital and an asylum for the insane.

Molinari, mō-lē-nā-rē, Gustave de, Belgian political economist: b. Liège, Belgium, 3 March 1819. He studied medicine and became a homoeopathic physician in Brussels, but upon removing to Paris he entered journalism. His reputation as a radical compelled him to return to Belgium upon the accession of Napoleon III., and he was appointed to the chair of political economy in the Musée Royal d'Industrie Belge. In 1881 he returned to Paris and edited the 'Journal des Economistes' and later founded the journals 'L'Economiste Belge' and 'La Bourse du Travail.' Among his books are: 'Etudes économiques' (1846); 'Cours d'Economie politique' (1861); 'L'Evolution économique' (1880); 'Comment se résoudra la question sociale' (1896); etc.

Moline, mō-lēn', Ill., city in Rock Island County; on the Mississippi River, and on the Chicago, R. I. & P., the Chicago, B. & Q., and the Chicago, M. & St. P. R.R.'s; about three miles east of Rock Island, nearly opposite Davenport, Ia., and about 155 miles west of Chicago. In the part of the river between Moline and Davenport is an island from which to the shore have been built dams to secure water-power. Moline has good water-power which is utilized in developing the manufacturing industries. The extensive coal fields in the near vicinity contribute to the industrial development of the city. The chief manufactures are

MOLINO DEL REY—MOLLUSCA

wagon, carriages, agricultural machinery, steel, foundry and machine-shop products, steam engines, saw- and planing-mill products, pumps, paper, flour, and dairy products. Some of the prominent buildings are a library building, which cost (1903) \$50,000, a city hospital, several fine church and school buildings. The city library was founded in 1892 and (1904) contains about 10,000 volumes. There is a good library connected with the high school. The city owns and operates the waterworks. Pop. (1890) 12,000; (1900) 17,248; (1910) 24,199.

Molino del Rey, mò-lé'nò dèl rà. See MEXICAN WAR.

Molinos, Miguel de, mè-gèl' dè mò-lé'nòs, Spanish mystic, founder of the Quietists: b. near Saragossa 21 Dec. 1600; d. Rome 29 Dec. 1696. He studied at Pamplona and Coimbra, took holy orders, went to Rome in 1669, and there published in 1675 his 'Guida spirituale,' which urged the immediate presence of God and pure love toward God as the only way to salvation and peace, which can not be attained until the soul is free from all that is material. His opponents, notably the Jesuits, held that this meant the indifference of the individual to the external world. In 1685 he was summoned before the Inquisition; two years later was found guilty of spreading dangerous doctrines. He publicly recanted all his teachings and was imprisoned until his death. Even Pope Innocent XI., a friend of Molinos, was examined by the Inquisition—but not as Pope, merely as Odescalchi, an individual. The 'Spiritual Guide' has been translated into the languages of Europe. See QUIETISM. Consult Bigelow, 'Molinos the Quietist.'

Mollah, mò'l'a, or Mullah, mù'l'a, a Turkish title, originally meaning simply 'lord,' or 'sir,' in its narrower usage a judicial rank. In Turkey there are three classes of mollahs, with jurisdiction over divisions of various importance; those in control of small towns constitute the lowest grade; they, like the second grade, hold office only for a month at a time; the first grade is made up of those having legal authority over pashaliks. The mollah ranks below the kahias-kar and multi, but is superior to the cadi. He is versed in both ecclesiastical and civil lore. Hence, and because of its original meaning, the word is often used more loosely of Mohammedan dignitaries or scholars in Africa. See MAD MULLAH.

Mollendo, mò-làn'dò, Peru, a seaport on the Pacific coast, in the department of Arequipa, near the mouth of the river Tambo, and seven miles south of Islay. A railway connects it with Puno on Lake Titicaca. It is the port through which the principal imports and exports of southern Peru and Bolivia pass. The principal exports are alpaca, wool, silver, and copper ores. Pop. over 2,000.

Molloy, J. Fitzgerald, English biographer. Among his numerous works may be cited: 'Court Life Below Stairs, or London Under the First Georges' (1882); 'Court Life Below Stairs, or London under the Last Georges' (1883); 'Life and Adventures of Peg Woffington' (1884); 'Life and Adventures of Edmond Kean' (1888); 'The Most Gorgeous Lady Blessington' (1896); 'Historical and Biograph-

ical Studies' (1897); 'The Queen's Comrade' (1901).

Mollusca, one of the great divisions or phyla of the animal kingdom, containing the oysters, clams, snails, slugs, squid and cuttlefish. The group is sharply marked off from all others and is characterized by the following features: The body is primarily bilaterally symmetrical with the mouth and anus at the two ends of the body, the alimentary tract traversing it as an axis. On the lower surface of the body is developed a muscular outgrowth, the foot; while on either side a fold of skin arises near the back and hangs down enclosing a space between it and the body and foot. The fold is the *pallium* or mantle, and the cavity is called the mantle or branchial chamber, from the fact that the true gills (*ctenidia*) arise in the angle between mantle and body and project into the space. The dorsal surface of the body usually has the power of secreting a protective shell, ordinarily strengthened by carbonate of lime. The heart, which always contains arterial blood, lies in a chamber (the *pericardium*) dorsal to the intestines, while the excretory organs, which are true nephridia, connect the pericardium with the outer world. The nervous system consists of a series of paired ganglia connected by nerve-trunks. Of these ganglia the most constant are (1) the cerebral, at the anterior end, above the oesophagus; (2) the pedal in the foot; (3) the parietal on the sides of the body; and (4) the visceral near the hind end of the body ventral to the intestine. All of the ten thousand species of living mollusks are built upon this plan.

Details of Structure.—Mantle and Foot. Typically the mantle is a paired structure, but in most groups the two halves unite in front and behind. This has its effect upon the shell, since where the lobes are separate, there are two halves or valves to the shell, but where united there is but a single (univalve) shell. Sometimes this univalve shell is a straight cone, but, while conical, it is usually coiled in a spiral, a part of the body extending toward the apex of the cone. As the animal increases in size the shells also increase in thickness and extent, the successive additions being usually recognizable on the external surface by lines of growth which run parallel to the free edge of the shell. When the edge of the mantle is provided with projections, lobes, etc., these cause ridges or protuberances on the surface of the shell. When the mantle is colored (striped or spotted), the color-pattern is reproduced in the shell, since pigment from the mantle is deposited along with the carbonate of lime. There is also a structure to the shell which needs mention. On the outside is usually a thin organic cuticle and beneath this two layers of carbonate of lime. Sometimes the inner of these layers consists of thin lamellæ parallel to the surface, the free edges of which produce diffraction spectra and thus give the inside of the shell an iridescent appearance—mother-of-pearl. See PEARL.

In the bivalve shell (see BIVALVES) an elastic hinge ligament connects the two valves and causes them to open. The valves are closed by muscles (adductors), one or two in number, which extend across the body, from valve to valve. In the univalves there is always a muscle attached to the inside of the spiral, by the contraction of which the animal is retracted into the shell, the foot being the last part to disap-

MOLLUSCA

pear. In many groups the posterior dorsal part of the foot bears a horny or calcareous plate, the *operculum*, which closes the aperture of the shell like a door when the animal is retracted. On the other hand the shell is frequently greatly reduced and may become internal, as in the slugs and squid; or it may be entirely absent in the adult, as in the so-called naked mollusks (nudibranchs) although it is formed in the young and later lost.

Foot.—The foot, which projects from the mid-ventral surface of the body, shows great modifications, but is rarely lacking. Usually it forms a broad creeping disk on which the animal glides about, but in the *Scaphopoda*, as in most acephala, it is flattened from side to side and forms an efficient digging organ. In the cephalopods it becomes developed in part into the tube (siphon) connecting the mantle-cavity with the exterior; in part into the tentacles surrounding the head.

Digestive Organs.—The alimentary canal is typically a straight tube, but in most forms it becomes convoluted to increase the amount of digestive surface, while not infrequently it is so flexed on itself that mouth and vent, instead of being at opposite ends of the body, are in close proximity to each other. In all except the acephala the region of the mouth contains a peculiar structure, variously known as the lingual ribbon, radula, or odontophore. This consists of a strong band, having upon its upper surface numbers of rows of hard horny teeth—in fact, a flexible file; and of muscles adapted to draw it back and forth over any object to which the mouth may be applied. In this way the snails rasp away vegetation, or, as in the case of shells of other mollusks, are perforated in order that the soft parts may be reached and devoured. In the cone-shells a poison-gland is connected with the lingual ribbon. Wear at one end of the ribbon is made good by constant growth at the other end. Behind the gullet is a large sac-like stomach, and closely connected with it are the ducts of the voluminous liver. The intestine is long, without enlargements, and in many acephala is remarkable for passing through the heart.

Circulation.—The heart lies dorsal to the digestive tract enclosed in a special sac, the pericardium, which is to be regarded as the sole representative of the true body-cavity or coelom (see *EMBRIOLOGY*). In the heart two parts are always to be distinguished, a muscular ventricle which forces the blood through the arteries to all parts of the body, and one or two auricles which receive the blood as it comes from the gills and force it into the ventricle. As will be seen, the heart thus receives only oxidized or arterial blood. With the loss of the gill of one side the corresponding auricle disappears. When four gills are present as in the nautilus, there are four auricles. In the cephalopods branchial hearts, which force the blood through the gills, occur. At one time it was thought that some of the blood-vessels opened to the exterior, but this has been shown to be a mistake. The blood is usually yellowish or colorless, but occasionally is red, the color being due to the plasma and not to the contained corpuscles which resemble the leucocytes of the blood of man.

Gills.—As was mentioned above, there may be two kind of gills, the ctenidia and the secondary or adaptive gills, the latter occurring

only in the gastropoda. The ctenidia, which always occur in the angle between mantle and body-wall, consist, typically, of a series of filaments with blood-vessels in the interior, the filaments and the ridge from which they spring resembling somewhat the teeth and back of a comb, whence the name (Greek *ctene*, comb). The ctenidia are typically paired, but in the nautilus there are two pairs, while in many gastropods one ctenidium (that of the left side) is lost. The adaptive gills occur on various parts of the body, usually upon the back. In most land snails (*Pulmonata*) the gills entirely disappear and an air-breathing organ, the lung, is developed on the walls of the mantle cavity, the opening to it being usually on the right side of the body.

Nerves.—The nervous system was described above. It is only necessary to say that the ganglia may coalesce into a smaller number. There are usually present three pairs of sense organs, a pair of eyes connected with the cerebrum, a pair of so-called ears (really organs of equilibration) connected with the pedal ganglia, and a pair of organs of smell (osphradia) with the visceral ganglia. Of these the eyes are the least constant. In some cases they are replaced by numerous other eyes developed upon the back or upon the edges of the mantle.

Viscera.—The excretory organs are true nephridia, that is, coiled tubes opening at one end into the coelom (pericardium), and at the other to the external world. They are also known as the organs of Bojanus. The reproductive organs are large. Usually the sexes are separate, but some, like the land-snails, are hermaphroditic. In no case is an asexual reproduction (fission, budding, etc.) known. A few bring forth living young. In many species a metamorphosis occurs during the development. In these a peculiar larva, known as the veliger, hatches from the egg, a larva which is closely similar to the "trochophore" larva of the annelids, a resemblance which points to a relationship between the two groups. The veliger receives its name from the "velum," a circle of cilia upon the dorsal side of the head above and in front of the mouth, by means of which the larva swims.

Classification.—The mollusks are divided into five classes, *Amphineura*, *Scaphopoda*, *Gastropoda* and *Cephalopoda*.

Amphineura.—This, the most primitive group of mollusks contains the chitons (*Placophora*) and the *Solenogastres*, in both of which the body is markedly bilaterally symmetrical, while the nervous system is of a very low type. The chitons (q.v.) are flattened and covered with eight transverse plates of shell. The *Solenogastres* are worm-like shell-less forms of the deeper seas.

Pelecypoda or Acephala.—These are the mollusks which have the shell in two parts or "valves," no head, and the filaments of the gills more or less completely united into a couple of leaves (lamellae) on either side of the body. See *BIVALVES*.

Scaphopoda.—This class includes a few marine forms of small size known as tooth-shells, from having shells shaped somewhat like an elephant's tusk, and open at both ends. See *DENTALIA*.

Gastropoda.—In these, the so-called snails,

MOLLUSCOIDA—MOLTING

the foot is usually a broad creeping disk and the head is well developed. See *GASTEROPODA*.

Cephalopoda.—In these the head is well marked off from the body, and the mantles of the two sides are united so that a single mantle cavity results, which is open to the exterior in front. See *CEPHALOPODA*.

Formerly two other orders of mollusks were recognized, the *Heteropoda* and the *Pteropoda*, but the heteropoda are now known to be prosobranchs, the pteropods to be opisthobranchs, both being modified for a life on the surface of the sea.

Bibliography.—Hescheler, in Lang's 'Comparative Anatomy' (2d ed. 1896); Woodward, 'Manual of the Mollusca' (4th ed. 1880); Cooke, 'The Mollusca,' in Cambridge Natural History, Vol. III. (1895); Kingsley, 'Standard Natural History,' Vol. I. (1885). Tryon and Pilsbury began in 1896 a work in which they proposed to describe and figure every known species of mollusk. For mollusks of the United States consult writings of Gould, Binney, Morse, Tryon, Dall, Verrill, Bush, Stearns, etc.

Molluscol'da, a group of animals formerly recognized by some naturalists, which included the *Brachiopoda*, the *Polysoa*, and the *Tunicata*. On account of misinterpretations of structure these were once included in the *Mollusca*, and when removed from that group the name *Molluscoida* was given. Next the *Tunicata* were removed to the *Chordata*, and later the group *Molluscoida* was abandoned.

Mollwitz, möl-vīts, Prussia, a village of Silesia, 25 miles southeast of Breslau, which gives its name to the battle fought to the east of the village 10 April 1741 between the Prussians under Frederick the Great and the Austrians under Marshal Neipperg. About 20,000 troops were engaged on each side, and the Austrians gained the first advantage in putting the Prussian cavalry to flight. The Prussian infantry, however, commanded by Marshal Schwerin, stood their ground for five hours and won the battle. The Prussians lost 5,500 men and the Austrians 5,340. The victory led to an alliance between France and Prussia, and to Austria ceding the province of Silesia to Frederick the following year, to dissolve the alliance.

Molly Maguires, an Irish secret society formed in 1843 to intimidate bailiffs or process-servers distraining for rent, or others impounding the cattle of those who were unable or unwilling to pay rent. A similar society was formed in 1877 in the mining districts of Pennsylvania. The members sought to effect their purpose by intimidation, carried in some cases to murder. Several were arrested, tried and executed, and the society was disbanded.

Mollymank, a bird. See *FULMAR*.

Molmenti, Pompeo Gherardo, pòm-pä'ò gè-rärd'ò möl-män'tè, Italian author: b. Venice, Italy, 1852. He studied law and practiced in Venice, but abandoned it to become professor of Italian literature at the Liceo Marco Foscarini. His literary work comprises critical essays, history of literature and art and also fiction, among which are: 'Impressioni letterarie' (1873); 'Storia di Venezia nella vita privata' (1880); 'Studi e ricerche di

storia e d'arte' (1892); 'Antonio Fogazzaro' (1900).

Moloch, mō'lōk, or *Molech* (Heb. *mōlēkh*, king), called in Scripture an idol of the Ammonites, the fire-god of Phœnicia. His image was an iron statue, with a human body, the head of an ox, and extended arms. The statue is said to have been heated by a fire placed in the lower part, and children were placed as offerings in the arms. His cult was introduced into Judah, and Solomon built a temple to him on the Mount of Olives.

Moloch, a small Australian desert-lizard of the family *Agamidae*, whose skin is covered with irregular plates bearing thorny pointed tubercles, spines and prickles all over the body, but especially well developed behind the head. Altogether its appearance is alarming, reminding one of a miniature of some armored saurian of the Mesozoic era. It is, however, quite harmless, subsists mainly on ants, and its formidable aspect, as in the case of the similar horned toad (q.v.), is wholly defensive in two ways—first as a real defense against being too readily seized and swallowed by enemies, especially serpents; and second, by exposing a very large and highly absorbent surface to whatever moisture the air may contain. Consult Saville-Kent, 'Naturalist in Australia' (1897).

Molokai, mō-lō-ki', Hawaii, an island of the group about 40 miles long and seven to nine miles broad. It is noted for the government settlement for lepers where Father Damien spent his noble life of self-sacrifice. See *HAWAII*; *LEPROSY*.

Molokan, möl-ō-kän', plural *Molokani*, mol-ō-kä'nè, one of a sect in Russia who follow the laws of Moses regarding meat, forbid the use of images or the sign of the cross, and consider war unlawful. They derive their name from the quantity of milk-food eaten by them.

Molting, the change of skin or feathers, which occurs annually or periodically in insects, etc., and especially in birds. It is a process often perilous to the animal, being not infrequently attended by loss of life. In mammals it may be gradual, as when the pelage or hair is changed. Other examples are the annual shedding of the antlers of deer in spring, or the autumnal dropping of the horns of the prong-horn antelope.

Molting in Amphibia and Reptiles.—Here the entire skin is cast. The newt in early spring sheds its skin by detaching it from around the jaws, then pulling it back over the head, and the limbs. The toad in molting causes the old skin to split along the back, it then pulls it off as one would a coat by working the muscles of the back; it is detached by movements of the head from around the lips, face, eyes and mouth; the skin is more readily pulled off from the legs to the tips of the toes. The skin, as in salamanders, is a thin film, and it comes off in four pieces. Immediately after molting the creature is shy and active. Sharp describes the molting of the common striped snake (*Eutamias sirtalis*). One came out of the water in a vivarium, gliding on to the grassy sod; it then shrugged itself for a moment, when the skin parted at the jaws. The skin on the head, how-

ever, remained fixed, so that when the creature crawled out the old skin was inside out. The operation took less than one minute.

Molting in Birds.—The feathers may all be cast or only a part of them. Young birds molt several times before adult age. The passerine birds undergo a complete ecdysis after the breeding season is over (post-nuptial), when the worn-out plumage is restored; and they may also before the breeding time pass through an incomplete molt, when their wedding dress is put on. The process is so gradual as a rule that few birds, except the ducks, etc., are unable to fly, or go unprotected. The height of the molting season is in August, though the feathers drop out in nearly every month of the year. The complete molt is undergone in from a month to six weeks' time. Besides their feathers the pelican sheds a horny projection on the ridge of the bill, and the puffin and certain allied species shed the horny sheath of the bill, etc. For further information see PLUMAGE.

Molting in Crustacea and Insects.—The horsefoot crab (q.v.) frequently sheds its skin opening around the edge of the head; this is also the case with the fresh-water crustacean *Apus*. In the crayfish and lobster the skin splits open between the thorax and abdomen, and the animal draws itself out of the transverse rent thus formed. The skin is cast entire, while the chitinous lining of the mouth, throat, fore stomach and of the rectum is also shed. The process of exuviation in the crayfish has long been known to be aided by the outgrowth of little delicate papillae called casting-hairs; these serve to loosen the old integument; recently Packard has discovered similar papillae on the new or under-skin (hypodermis) of the lobster, and similar undergrowths aid the serpent in shedding its scaly epidermis.

In insects molting is frequent, especially in the larva stage, most caterpillars molting four or five times. The body moves convulsively and splits along the back, at the same time, casting hairs being usually absent, a molting fluid is poured out which serves to detach the old skin. The head is molted separately, the shell falling off by itself, then the body-skin is shuffled off, being pulled back toward the tail, and with the outer integuments all the lining of the digestive canal is shed (except that of the stomach and beginning of the intestine), and the lining of the spiracles, as well as the cuticle of all the hairs, and the spines.

Consult: Newton, 'Dictionary of Birds' (1893-6); Dwight, 'The Sequence of Plumage and Molts of the Passerine Birds' (Annals New York Academy of Sciences, Vol. XIII., 1900); Packard, 'Text-book of Entomology' (1898).

Moltke, Helmuth Karl Bernhard, hēl'moot kār'l bērn'hārt mōlt'kē, COUNT VON, German soldier: b. Parchim, Mecklenburg-Schwerin, 26 Oct. 1800; d. Berlin 24 April 1891. In 1812 he was admitted as a cadet of the Royal Military Academy, Copenhagen. In 1818 he passed his examination for a commission as first of the candidates. Seeing little prospect of advancement, he entered the Prussian service in 1822, becoming 2d lieutenant. He then studied three years at the staff college, Berlin; in 1832 was appointed to the general staff; in 1833 became lieutenant, and in 1835 captain. He had already visited Italy, and he now went to Turkey,

where he became military adviser of the sultan Mahmud. He took part in the Turkish expedition against Ibrahim Pasha in 1839, but his advice was disregarded, and he returned to Constantinople, and on Mahmud's death to Berlin, where he was again employed on the general staff. His experiences in Turkey led him to publish two valuable works: 'The Russo-Turkish Campaign of 1828-29 in European Turkey' (1835), and 'Letters on Affairs in Turkey in the Years 1835-39' (1841). After rising through the various army grades he was placed permanently at the head of the general staff of the army in 1859 with the rank of lieutenant-general. His labors in reorganizing the Prussian army were of immense value to Prussia and to Germany, and had a great influence on the general history of Europe. The defeat of Denmark in 1864 was largely owing to his genius for military operations, and the result of the greater war of 1866 against Austria is equally to be attributed to him. Then followed the Franco-German war of 1870, for which Moltke was entirely prepared, having foreseen for some years what was likely to happen, and having immediately after the Austrian war prepared for a campaign against France. The brilliant success which followed was in very large measure a personal triumph for Moltke. He passed his 70th birthday at Versailles, and was raised by the king of Prussia to the rank of count on receipt of news of the capitulation of Metz. On his return to Berlin he was made a field-marshal, received from parliament a grant of \$225,000, was appointed for life a member of the Prussian upper house, and other honors were conferred upon him. He held the post of chief of the staff till after the accession of Emperor William II in 1888, when he resigned on account of advanced age, but was made president of national defense. His 90th birthday was made the occasion of public demonstrations in his honor all over Germany. He was a man of great modesty and simplicity, kind and considerate to subordinates, and devoted, above all things, to duty. His military genius was compounded of boldness in design with minute care in execution. From his reticence it was wittily said that he was silent in seven languages. Besides the works already mentioned, Moltke wrote 'Letters' (1892), and the works of the general staff on the Italian war of 1866, and the Franco-German war of 1870-1 are largely from his pen. Consult the 'Essays, Speeches, and Memoirs' which appeared in 1893; also Pinkerton's English translation (1879) of Müller's 'Life.'

Moluccas, mō-lōk'az, or Spice Islands, East Indies, three groups of islands in the Malayan or Indian Archipelago (q.v.), between Celebes and New Guinea, and the Philippines and Timor Archipelago. (1) The Ternate Islands, or Moluccas proper, consisting of Ternate, Gilolo, Batshian, Obi, Morti islands, and numerous islets. (2) The Amboyna Islands, including, besides Amboyna, which is the chief seat of government for the whole Moluccas, the islands of Ceram, Booroo, and other smaller islands. (3) The Banda Islands. They are nearly all mountainous, and some of them have peaks rising to a height of 7,000 feet or 8,000 feet, mostly volcanic; there are still several active volcanoes in the group, and earthquakes are

of frequent occurrence. Cloves, nutmegs, mace and sago are exported to Europe; and birds'-nest, trepang, and shark-fins to China. The Moluccas, discovered in 1512, were alternately in the possession of the Spaniards, Portuguese, and Dutch. They were taken from the latter by the British in 1796, and in 1810, but in 1814 again given up to Holland, in whose possession they still remain. The general language on the coast is the Malay.

Molybdenite, a native sulphid of molybdenum, having the formula MoS_2 , and crystallizing in tabular or hexagonal forms, probably belonging to the hexagonal system. It has a marked basal cleavage, and resembles some forms of mica. It is leaden-gray in color, with a metallic lustre, a specific gravity of about 4.7, and a hardness of from 1.0 to 1.5. It commonly occurs in granite, gneiss and other crystalline rocks. In the United States it is found in the New England States, and in New York, Pennsylvania, Colorado, and California. It also occurs in Canada, and crystals from one to two inches in diameter have been discovered in Renfrew County, Ontario.

Molybdenum, a metallic element whose compounds are somewhat widely diffused, though they rarely occur in any considerable quantity in any one place. Molybdenum is never found in the metallic state, but it occurs in a number of minerals, the most important of which is molybdenite (q.v.), the native sulphid. Molybdenite resembles galena in some respects, and owes its name to this fact, the word "molybdenite" being based upon the Latin name for galena. It was first clearly distinguished from galena by Scheele, in 1778, and in 1782 Hjelrn obtained the element molybdenum in the metallic form. Molybdenum may be prepared by reducing the oxid by hydrogen, carbon, or potassium cyanide, as well as by various other methods. It is usually described as a silvery white metal, hard, but somewhat malleable. It has a specific gravity of about 8.6, and a specific heat of about 0.0659. Its melting point is higher than that of platinum. Molybdenum is not affected by air or moisture at ordinary temperatures, but oxidizes slowly when heated in air, and at high temperatures it burns, whether heated in air or in steam. Chemically, molybdenum behaves both as a metal and as a non-metal. It has the chemical symbol Mo , and an atomic weight of 96 if $\text{O} = 16$, or 95.3 if $\text{H} = 1$. It forms several oxids, of which the trioxid, MoO_3 , is the most important. This is the oxid that is formed when the metal is burned in air, and it may also be prepared by roasting the native sulphid in air. The trioxid occurs native in small quantities, as "molybdenum ochre," or "molybdite." Metallic molybdenum combines directly with chlorine to form MoCl_4 , and with bromine to form MoBr_3 ; but it does not combine directly with iodine. Unlike the other metals, molybdenum does not readily replace the hydrogen of acids to form definite salts, but its oxids dissolve in acids with the formation of compounds which have, as yet, been but little studied. The trioxid combines with water to form substances of the nature of acids, and which are, in fact, called "molybdic acids." These further combine with metallic bases to form an extensive series of compounds known as "molybdates." The compounds of molyb-

denum are of interest only to the chemist, as they have no extensive use in the arts. Ammonium molybdate, however, is used in the laboratory as a reagent for the detection of phosphoric acid, a yellow precipitate being thrown down when a nitric acid solution of ammonium molybdate is added to a solution containing a phosphate.

Molyneux, mól'-nooks, William, Irish philosopher: b. Dublin 17 April 1656; d. there 11 Oct. 1698. He was graduated from Trinity College, Dublin, entered the Middle Temple, London, became a student of applied mathematics and philosophy, was elected F. R. S. in 1685, and was elected to Parliament for Dublin University in 1692 and 1695. Besides his works on optics and philosophy, he wrote 'The Case of Ireland's Being Bound by Acts of Parliament in England' (1698).

Mombasa, móm-bá'sá, Africa, an island and town on the east coast, the town, the chief seaport and the seat of administration of British East Africa, being on the north side of the island, which is 3 miles long by $2\frac{1}{2}$ miles wide, close to the coast, 150 miles north of Zanzibar, lat. $4^\circ 3' \text{ S}$. Here are an old Portuguese fort, a new European hospital, and the offices and workshops of the British East Africa Company. A short railway connects Mombasa with Kilindini, the naval coaling depot, on the other side of the island, where is the residence of the chief administrator of the company. Mombasa is also the terminus of a railway connecting with the Victoria Nyanza. Trade in (imports) piece-goods, brass and iron wire, beads, rice; and in (exports) ivory, gum, copal, copra, ochella weed, maize, and grain; carried on by natives of British India. Pop. about 25,000. Island and port are mentioned as early as 1331. It was visited by Vasco de Gama in 1497, held by the Portuguese from 1520 to 1698, and by the British from 1824 to 1826, but the British refused to accept cession of it. Soon after the Sultan of Muscat obtained possession of the town, which at his death fell to his son, the Sultan of Zanzibar. In 1888 the Imperial British East Africa Company received governing rights over it from the Sultan of Zanzibar, and since then it has passed definitely over to the possession of Britain, along with the huge territory on the mainland allotted to that country.

Mombert, móm'bért, Jacob Isidor, American Episcopal clergyman and author: b. Cassel, Germany, 6 Nov. 1829. He was educated at Leipzig and Heidelberg, took orders in the English Church and in 1857 removed to Canada. He was assistant rector in Trinity Church, Quebec, 1857-59; rector of St. James, Lancaster, Pa., 1859-70, of St. John's, Dresden, 1870-6, of Christ Church, Jersey City, 1877-9, and of St. John's, Passaic, N. J., 1879-82. Since the last named date he has given his attention to literature. His writings include: 'Great Lives' (1886); 'Charles the Great' (1888); 'Handbook of English Versions of the Bible' (1890); 'Short History of the Crusades' (1890); 'Raphael's Sistine Madonna' (1895); etc.

Moment of a dynamical quantity is the importance of that quantity in regard to its dynamical effect relatively to a given point or axis. The moment of a force about a point is the product of its amount into its perpendicular

lar distance from the point. The tendency of the action of such a force is to cause rotation about an axis perpendicular to the plane passing through the point and containing the force. Thus, in the case of a pendulum, the effectiveness of the force in causing rotation is measured by the moment Wl —where W is the weight of the pendulum, and l is the distance of the line of action of the force W from the centre of rotation C , or the distance of the centre of mass G from the vertical line through C .

The term moment enters into several other phrases, all of which relate either directly or indirectly to rotation. Thus, there is the moment of momentum, or angular momentum, whose rate of change is the measure of the moment of the force producing the change. To obtain it for any given body rotating with angular speed ω about an axis, we first imagine the body broken up into a great many small portions of masses m_1, m_2, m_3 , etc., at distances r_1, r_2, r_3 , etc., from the axis, multiply the momentum ($m\omega r$) of each mass by its distance, and then take the sum of all these products. The angular speed ω being the same in every expression, the moment of momentum takes the form $\omega(m_1 r_1^2 + m_2 r_2^2 + \dots)$, which it is usual to write in the symbolic form $\omega \Sigma mr^2$. The quantity Σmr^2 , which is the sum of the products of each mass into the square of its distance from the axis, is called the moment of inertia about that axis. It is the factor in the moment of momentum, which depends upon the distribution of matter in the body. It enters into all questions of mechanics in which rotation is involved, from the spinning of a top or the action of an engine governor to the stability of a ship. By an obvious extension, the word moment is also used in such combinations as moment of a velocity and moment of an acceleration. Such phrases correspond to nothing truly dynamic, unless we regard velocity as meaning the momentum of unit mass, and acceleration as the rate of change of that momentum.

If the mass of every small portion of matter in a body be multiplied by the square of its perpendicular distance from a straight line, the sum of all such products is called the moment of inertia of the body about the line regarded as an axis. The radius of gyration of the body is the distance from the axis at which all the matter of the body might be concentrated without altering the moment of inertia. Thus, if I is the moment of inertia of the body, M its whole mass, and k its radius of gyration, $I = Mk^2$. We see that the moment of inertia of a body about a line is found by adding a great number of products of small masses and squares of distances; if the body can be defined mathematically as to shape, size, and density, finding its moment of inertia is a problem of the integral calculus.

Moment of Inertia. See MECHANICS.

Momentum, in mechanics and physics, the product of the mass and velocity of a body. Like velocity, momentum is usually regarded as having a definite direction, as well as a definite numerical magnitude. The momentum generated by a constant force acting upon a material particle for a definite length of time, is numerically equal to the product of the force by the time during which it acts. See MECHANICS.

Mommesen, môm'sên (Christian Matthias) Theodor, German scholar: b. Garding, Schleswig, 30 Nov. 1817; d. Charlottenburg, near Berlin, Prussia, 1 Nov. 1903. He was a student of jurisprudence and philology at the University of Kiel; took his Ph.D. in 1842; published with his brother Tycho and his friend Storm a volume of verse which was heartily condemned by the reviewers (1843); began more successfully his career as historian with the treatise 'De Collegiis et Sodalitatibus Romanorum' (1843), commended for its thoroughness and a clarity of style new to German works of this kind; and in 1844-7 was in France and Italy under commission of the Berlin Academy, collating manuscripts and inscriptions. On his return he edited for a short while the *Schlesien-Holsteinische Zeitung*, and in 1848 became professor of Roman law at Leipzig. He entered politics as an advocate of constitutional progress, was arrested for inciting to revolt, and though acquitted by the courts was deprived of his chair. From that time he was an eager if not invariably judicious disputant in many political controversies. He was appointed to the professorship of Roman law at Zürich in 1852, at Breslau in 1854; and from 1858 until his death was professor of ancient history in the University of Berlin. In 1873 he was elected perpetual secretary of the Berlin Academy; but this post he resigned in 1895. For ten years (1873-82) he was a Liberal member of the lower house of the Prussian parliament, where he bitterly attacked Bismarck's domestic policy. In an election speech at Charlottenburg in 1888 he characterized the Iron Chancellor's tariff measures as a "Politik von Schwindel." Such boldness might not go unrewarded, and Mommesen was brought to trial for slander. His acquittal by both a lower and an appeals court was one of his great triumphs. He sternly advised the Teuton element in Austria in the struggle with the Czechs; made some caustic observations in a 'North American Review' article on British treatment of minor nations; to the last was quite as belligerent as ever.

But he was only incidentally the politician. He was pre-eminently what Freeman called "the greatest scholar of our times, well nigh the greatest scholar of all times" ('Methods of Historical Study'). He was distinguished as an epigraphist, historian, jurist, numismatist, and philologist. None in the 19th century, which he almost spanned, has, as Freeman goes on to say, "taken in so wide a range of subjects, all brought with the happiest effect to bear upon and to support one another." To the educated reader at large he will probably continue to be best known for his 'Römische Geschichte' (3 vols. 1854-6; 8th ed. 1889), to the battle of Thapsus; together with Vol. V. on the provinces from Caesar to Diocletian (1885). Volume IV., on imperial Rome, was unfinished at his death. There are English renderings by W. P. Dickson (Vols. I.-III. 1862-6; Vol. V. 1886). This work opened a new epoch in historiography. Though written with great spontaneity, without even references to original sources, it was based on unrivalled knowledge, and presented its material with extraordinary clearness and at times with brilliancy. It is of course somewhat dogmatic, is certainly unfair to Cicero, and has been blamed, by Freeman among several, for undue

regard of mere power and success. To scholars Mommsen is above all the editor of the great 'Corpus Inscriptionum Latinarum' (1863 et seq.; Vols. I., III., VIII., IX., by himself; others under his immediate supervision). Every inscription of this monumental collection was taken down from the original. The errors and falsities of predecessors were cleared away, and a scientific foundation was supplied for the study of Roman antiquities. Mommsen's preface to the series is said to be thought by critics one of the finest specimens of Latin prose written in modern times. For a complete list of his writings, Zangemeister's 'Mommsen als Schriftsteller' (1887) should be consulted. Mention may be made of 'Römisches Münzwesen' (1850), 'Römische Chronologie' (1859) and 'Römisches Staatsrecht' (1871-88). All are standard, but the last, particularly, by the breadth and completeness of his exposition of the Roman constitution, places Mommsen among the foremost of constitutional writers. He also edited the 'Res Gestæ Divi Augusti ex Monumentis Ancyranis et Apollinensibus' (1865; new ed. 1883); the 'Digesta' in Vol. I. of the 'Corpus Juris Civilis,' 6th ed. 1893), and many other publications. His library, when partially burned in 1880, was replenished by gifts from foreign scholars. In 1902 he was awarded the Nobel prize in literature.

Momordica, a genus of plants of the gourd family, remarkable for their strangely marked seeds. Two or three species are cultivated in the United States as ornamental plants, one of which (*M. charantia*) produces a food for the Chinese in the pulp about the sculptured seeds; another Oriental food, the golokkra of India, is the fruit of *M. cochinchinensis*; and the balsam-apple (*M. balsamina*) which furnishes a healing principle which is infused in oil to form a liniment highly esteemed in the Levant.

Momotombo, mō-mō-tōm'bō, Nicaragua, an active volcano rising from the northwestern shore of Lake Managua. It is 6,121 feet high; its last notable eruption was in 1852.

Mompox, mōm-pōs', or **Mompox**, mōm'-pōh, Colombia, a town of the province of Bolivar on an island formed by the Magdalena. The streets, which extend parallel to the river, are well laid out, but the houses are badly built. Mompox is a depot of foreign goods destined for consumption in the valley of the Magdalena; but the changes in the river's course rendering it unnavigable have seriously injured its prosperity. Pop. 10,000.

Mo'mus, in Greek mythology, the god of satire and mirth. He is generally represented raising a mask from his face and holding a small figure in his hand. His mother was Nyx, the goddess of night.

Mona, mō'nā, (1) a West Indian islet belonging to the United States since 1898. It has 42 miles east of Porto Rico, in the middle of Mona Passage, to which it gives its name; area, nearly 10,000 acres. It is a coral formation. The general level is about 60 feet above the sea-level, with a range of hills on the east side of the island, running from north to south, the highest peak of which is 175 feet above the wa-

ter. The island is well watered and well drained, has a luxuriant vegetation and all kinds of tropical fruits grow in profusion. It is the nesting place of thousands of green turtles, and the waters teem with the finest varieties of fish. The only residents belong to the lighthouse establishment; (2) the ancient name mentioned by Tacitus for the island of Anglesey (q.v.), Wales, also applied by other ancient writers to the Isle of Man.

Mona, a West African monkey (*Cercopithecus mona*), remarkable for its brilliant coloration, the head being olive-yellow, with a black stripe on the forehead; yellowish whiskers and a purple face. The back is chestnut-brown, and there is a white spot on each side near the root of the tail, which is black. It is constantly seen in menageries.

Monachism, or **Monasticism**, is a state of life in retirement from the world adopted for motives of religion. It is not peculiar to Christianity, for in many religions, as that of Israel, and in those of India, China and Tibet, the same motive has led men to withdraw themselves wholly or in part from converse with worldly society and to seek in seclusion and retirement opportunity to lead a purer or higher life. The Nazarites, the Rechabites, the Essenes, the Therapeutæ were separatists from society in a greater or less degree, and in this respect were the precursors of the ascetæ of the earliest Christian age and of the hermits or anachoretæ and the cœnobites of the third and fourth centuries.

In the middle of the 3d century, during the persecution of the Christians by Decius, Paul of Thebes in Egypt (St. Paul the first hermit), withdrew to a wilderness, and during the remainder of his long life lived in absolute solitude in a cavern of a mountain, deriving his food and his vesture from a neighboring grove of palm trees. Many others fleeing from persecution or from the contagion of a profoundly corrupt society, flocked to the wildernesses of the Nile country; among them was Antony (Saint Antony), who after many years of the strictly solitary life of an anachoretæ was in a manner compelled by circumstances to adopt the cœnobia rule. He was by choice an anachoretæ like St. Paul the Hermit, but the fame of his virtues and his miracles brought to his cell in a remote wilderness many who desired to devote themselves to the service of God under such a master; and as he could not refuse their prayer he became, in fact if not in name, the Father or Abbot of a pretty numerous cœnobia; hence he is called the Father of Monachism, that is, of the life-in-common of those who retire from the world for reasons of religion; they retain the title of monk, *monachus* (a solitary), though since St. Antony's day they are no longer solitaries but cœnobites.

Antony's cœnobites occupied each a separate hut or a separate grotto; but St. Pachomius, a contemporary of Antony, introduced a further development of the community life. The cells or huts were now to hold three brethren; meals were eaten in common; the labor of the monks was regulated; the brethren were graded according to their spiritual proficiency; the community was presided over by an abbot, with inferior officers; in addition to the primitive industries of petty agriculture, basket-making

MONACHISM

and mat-weaving, the monks practised the trade of the smith, of the tanner, etc.; there were daily assemblies of the community for prayer and conference. When St. Pachomius died, about the middle of the 4th century, 7,000 monks were subject to his rule.

From Egypt monachism soon spread into Syria, Palestine, Mesopotamia, Asia Minor and Armenia.

The introduction of monachism in the Western countries of the Roman Empire dates from a little after the middle of the 4th century when a few small communities of monks, under the Pachomian rule, were founded at Rome and in Northern Italy. Later, when the rule of St. Basil had been translated into Latin, communities of Basilian monks sprang up in Southern Italy. Saints Jerome, Augustine and Ambrose were zealous promoters of monachism in Italy and Africa, St. Martin of Tours in Gaul; when St. Martin died (397) his body was followed to the tomb by 2,000 monks.

Whether under the Pachomian or the Basilian rule or under modifications of these, monastic establishments multiplied rapidly in the West. But the disorder which attended the decline of the Western Empire and the barbarian invasions, had its effects upon monachism, and the monastery exhibited the same anarchy as did civil society.

Early in the 6th century Benedict of Nursia, who had already led for three years the life of a strict recluse in a cave at Subiaco, about forty miles distant from Rome, was chosen by the monks of a monastery in the same place as their abbot; but very soon, his new subjects having deposed him, he returned to his solitude and commenced that reform of Latin monachism which made his name illustrious. He gave to his monks a rule which, variously amended and modified, has been the law of the monastic life of Western Europe ever since. In its preamble Benedict recognizes two and only two legitimate classes of monks—*cenobites* and *anachoretes*—those who lead the life in common and those who live in solitude—usually now called hermits.

Two other classes he names, but only for condemnation, namely, *sarabaites*—professing monks who live two or three together without any superior or any fixed rule; and *gyrovagi* or *circulatores*, tramps, wandering beggars who wear the cloak of a religious profession. To do away with these scandals of the monastic life, Benedict's rule requires that the postulant for admission to a monastery shall take in addition to the usual monastic vows of poverty, chastity and obedience, a further vow that he will remain all his days in the community in which he makes his profession, and never be absent from the monastery save by leave of his superior.

Besides monasteries for men Benedict instituted also monasteries of women, and the first abbess of a community of Benedictine nuns was his sister Scholastica.

The Benedictine order was for a long time a powerful agency in the civilization and christianization of the barbarian nations of Europe. Wherever a Benedictine foundation was made there the face of the country was quickly changed: forests were cleared, marshes drained, the arts of husbandry developed, peace and civil order maintained, science and learning fostered, schools, hospitals and refuges established.

Monastic institutions founded in Britain, France, Switzerland, Italy and Germany by Celtic monks prior to Benedict's reform conformed to the Benedictine rule. The Carthusian order, founded in the end of the 11th century, was a reversion to the anachoretic type of monachism—the solitary or eremitical instead of the *cenobitic* life. In the same century arose the order of the Camaldoli, another order of hermits.

The beginning of the 12th century saw the rise of that singular development of monachism, the knightly orders, the members of which besides the usual three vows of the monk took a fourth vow, of making war on the infidels for the defense of Christendom. The Knights Hospitallers were originally a religious society bound by vow to harbor in health and in disease pilgrims visiting the holy places in Jerusalem; their house in the holy city was a "hospital" or guest-house. The full title of the Knights Templars is "*pauperes commilitones Christi templique Salomonis*"—poor knights-companions of Christ and of Solomon's temple. Another military order contemporary with these was the Teutonic order. History records the titles of over ninety military orders or of bodies styling themselves so.

The chronic state of war between Christendom and the Mohammedan power led to the institution of the order of Trinitarians and that of Our Lady of Mercy. The mission of these orders was the redemption out of slavery among the Mohammedans of Christian captives. Bearing the alms and gifts contributed by the charity of Europe, the members of those orders visited the Mohammedan countries on the Mediterranean and procured the liberation of the enslaved Christian captives and restored them to their native countries. The Trinitarians had at one time 250 houses; the Christians redeemed by them, from first to last, numbered over 30,000. The order of Mercy was at first a military order, but in 1218 it put off its military character, and devoted itself wholly to the charitable work of redeeming the captives.

There seemed to be now a sufficiency of religious orders to satisfy all needs. But at this very time, the beginning of the 13th century, two new orders were instituted—and that by Pope Innocent III., who in the Lateran Council had procured the enactment of a decree forbidding the creation of new monastic orders. The new institutes were the order of the Friars Minor (Franciscans) and that of the Friars Preachers (Dominicans); and to these very soon were added two more—the order of Austin Friars (Augustinians) and that of the Carmelites. These are the four mendicant orders, so called because by their rule they renounce all property and all endowments and subsist on the alms of the faithful.

The membership and the establishments of these mendicant orders increased with astonishing rapidity throughout the whole of Europe. Dominican and Franciscan friars were soon the great lights of the theological schools—Albertus Magnus, the Doctor Universalis, as he was styled by his contemporaries, and Thomas of Aquinum, the Angelic Doctor, being the foremost of the Dominican divines, and Duns Scotus, the Doctor Subtilis, and Roger Bacon holding the first rank among the Franciscans. The friars were also effective missionaries both

MONACO—MONAGAS

among the poor and the rural populations at home and among the heathen and the infidels.

The Company of Jesus is the latest of the great religious orders; it was founded in 1534 and its mission was to resist the onward march of Protestantism, directly by combating the Protestant assault on the Catholic Church and by instructing the Catholic populations in the grounds of their religious faith and practice; indirectly by organizing a system of higher education for Catholic youth, and offering educational advantages superior to those afforded by Protestant universities and academies. The Company of Jesus took also as its special field of labor the evangelization of the heathen.

Nearly all the later religious orders and institutes have had for their object the Christian education of the young, the reformation of the fallen, or the relief of the poor and distressed; among the orders established for these ends are those of the Nuns of the Good Shepherd, the Sisters of Charity and of Mercy, the Brothers of the Christian Schools, and numerous other congregations.

The Reformation was hostile to monasticism, and in those countries where it obtained, the monasteries were suppressed and the monastic life disappeared. Henry VIII. seized upon the monastic properties throughout his realm and applied them for his own religious or secular purposes. In Protestant Germany, Scandinavia and Switzerland, the monastic institution ceased to exist shortly after the triumph of the Reformation. In the 18th century a concertedly hostile movement against monasticism took shape in all the countries under Bourbon rule. The governments of Portugal, France, Spain, Sicily and some of the Italian principalities expelled the Jesuits and brought such political pressure to bear upon the Papacy that Clement XIV. reluctantly signed the decree suppressing that famous Society in 1773. Pius VII. restored the Society in 1814. During the latter half of the 19th century a recrudescence of hostility on the part of the governments of the Latin countries against the religious orders manifested itself. In Spain, France, Italy, Mexico and some of the South American republics expulsion for some orders and hampering restrictions upon freedom for others have contributed to retard their growth and development. The reasons usually alleged for these coercive measures by these governments are political and economic, the merits of which it would be out of place to discuss here. At the present time the French government has aimed a deadly blow at monasticism in that country in its Associations Law. Germany admits all the religious orders except the Jesuits. In Great Britain full freedom is now given in the establishment and development of monastic institutions. In the United States, where there are absolutely no legislative restrictions upon the freedom of monastic life, the religious orders are in a flourishing condition. In this country there are 8,000 male and 45,000 female members of religious orders.

In the Church of England within the last fifty years there has been a revival of the monastic idea with no inconsiderable results. Dr. John Mason Neale, and Canon Carter promoted the establishment of sisterhoods (of St. Margaret and of St. John Baptist), in which life vows of poverty, chastity and obedience were taken, and a mother house of the Sisters of St.

John Baptist was founded in New York as a branch of the central house in England. There is also the Protestant Episcopal sisterhood of St. Mary and many others in the United States. Among the male orders of Protestant monasticism must be mentioned the Cowley Fathers, founded by Dr. Benson, and in the United States the Order of the Holy Cross, a preaching order founded by J. O. Huntingdon, son of Bishop Huntingdon. An order of monks was also founded by Rev. Joseph Leicester Lyne in 1870 at Llanthony Abbey, Wales, and the strict rule of St. Benedict was adopted. It is no exaggeration to say that the monastic movement is now flourishing, both in the Church of England and in its daughter church, the Protestant Episcopal Church in the United States.

JOSEPH FITZGERALD,
Author of 'Word and Phrase.'

Monaco, mōn'ā-kō, the smallest independent European principality, bordering on the Mediterranean, 9 miles east of Nice, and enclosed on its land borders by the French department Alpes-Maritimes. It had an area of 51 square miles until 1861 when the Prince of Monaco ceded Mentone and Rocca-bruna to France for 4,000,000 francs. The principality has since been confined to the towns of Monaco, Condamine, and Monte Carlo with the surrounding districts, having an area of about 8 square miles, and a population of about 17,000. In the 10th century the Emperor Otho I. conferred Monaco on a prince of the house of Grimaldi, a scion of which (through a female branch) still continues to rule. The expenses of government, municipal and other, are defrayed by a joint-stock company, which carries on the famous gaming establishment at Monte Carlo, and which also pays a handsome yearly sum to the Prince for the concession. The capital, Monaco (pop. 3,291), situated on a lofty promontory overlooking the sea, in the midst of olive, orange, and lemon groves, is a renowned watering-place. Here are the palace and cathedral. There are numerous hotels and an English church at Monaco.

Mon'ad, in biology. See INFUSORIA.

Monadnock, mō-nād'nōk, New Hampshire, a mountain near the southwest corner of the State, in Cheshire County, 10 miles south-east of Keene. The base covers an area of five miles by three, and the altitude is 3,186 feet above the level of the sea; it is composed of slate, talc, and mica. The summit commands a fine view, and it is a conspicuous landmark, visible even from the dome of the state house at Boston.

Monagas, José Tadeo, hō-sā' tã-dã'ō mō-nã'gã, Venezuelan soldier: b. Maturin, Venezuela, 26 Oct. 1784; d. El Valle, Venezuela, 18 Nov. 1868. He served in the war of 1813-21 under Bolívar and rose to the rank of brigadier-general and was afterward engaged in various military measures until 1830 when he became a member of congress. Bolívar's death occurring in 1831 Monagas retired but was soon called to the command of the Orient. In 1835 he sup-

MONAGHAN — MONAZITE

ported a revolution but made his peace with the government a few months later and in 1847 was elected president. His administration was at first marked by liberal measures, but his policy becoming arbitrary he was deserted by his party, whereupon he abolished congress and assumed a dictatorship. He defeated Paez who led a revolutionary movement against him and disregarding his treaty, imprisoned him, and in 1851 took command of the army, the presidency being held by his brother. In 1855 he was re-elected, but a revolution followed and he was compelled to leave the country in 1858, after resigning the presidency. He returned in 1864 and in 1868 headed a successful revolution and was elected president by Congress, but died before being installed in the office.

Monaghan, mōn'a-gan, **John James**, American Roman Catholic prelate: b. Sumter, S. C., 23 May 1856. He was educated at St. Charles College, Md., pursued a theological course at St. Mary's Seminary, Baltimore, and was ordained to the priesthood in 1880. He held several pastorates in Charleston, S. C., and elsewhere, was chancellor of the diocese 1887-8, and assistant to the vicar-general at St. Patrick's, Charleston 1888-97. In May of the last named year he was consecrated bishop of Wilmington.

Moal, or **Monal**, a name among Anglo-Indian sportsmen for any of several Himalayan pheasants, especially the gorgeous species of the crested genus *Lophopterus*. See IMPEYAN PHEASANT.

Monamine, in chemistry, an amine that is derived by replacing one or more of the hydrogen atoms of a single molecule of ammonia by an equal number of monovalent organic radicals. Amines that are derived by joining two, three, or four molecules of ammonia, through the partial replacement of their hydrogen by a single polyvalent radical, are called di-, tri-, and tetra- amines respectively; and the monamines are known as primary, secondary or tertiary, according as one, two or three of the hydrogen atoms of the ammonia molecule have been replaced. See AMINE and AMIDE.

Monarch Butterfly. See DANAIS; MILKWEED BUTTERFLY.

Monarchians, a sect in the early church who asserted the oneness and singleness of the divine person, as at variance with the orthodox doctrine of the Trinity, three Persons and one God. The supremacy of God the Father, they maintained, was impugned by those who said that the Son was coeternal. If there was but one God, they taught, and Jesus Christ was God incarnate, then the Father must have suffered and died. Hence they were called Patripassians (q.v.). Christ was therefore merely one form or mode of the Father's manifestation; and the Father might also manifest himself through the Holy Spirit. This theory was called Modalism or Monarchical Modalism and its teachers Modalists. Praxeas (q.v.), a Christian of Asia, brought this doctrine to Carthage in the 2d century and was controverted by Tertullian (q.v.). The most noted of Patripassians was Sabellius (q.v.), and Modalism was widely known as Sabellianism in both the Eastern and Western Churches. There were other Monarchians called Dynamic Monarchians who taught that Christ became Son of God dynamically, by hav-

ing certain powers bestowed upon him in his adoption by baptism. Pope Victor I. in the 2d century excommunicated Theodotus the Tanner who professed this theory, and an Asiatic synod (268) condemned and anathematized the view as taught by the noted Paul of Samosata (q.v.), the minister of Zenobia (q.v.), queen of Palmyra. Monarchianism was revived in the 16th century by Socinus, and is in some form or other the essential basis of certain Unitarian creeds.

Monarchy, a form of government in which the supreme power is vested in a single ruler, and which is absolute, limited, or constitutional, hereditary, or elective.

Mon'astery. See MONACHISM.

Monastery, The, a novel by Sir Walter Scott, published in 1820, the scene of which is Scotland in the 16th century. In this tale Scott for the first time introduces a supernatural element, as in the mysterious appearances of the 'White Lady of Avenel,' and for this reason the book was never as popular with English readers as his other tales. Its sequel, 'The Abbot,' appeared the same year.

Monas'ticism. See MONACHISM.

Monastir, mō-nās-tēr, or **Bitolla**, bē-tō'-fl-a, Turkey, a city and vilayet of Macedonia (q.v.). The city, 86 miles by rail northwest of Saloniki; is built at the west edge of a plain, in a recess formed by two lofty mountains, and is intersected by a river, crossed by numerous bridges. The streets are wide and well-paved; the houses neat and clean; the mosques and minarets, picturesque; and the bazars handsome. It is an important central situation for all military operations relating to this part of Turkey. The majority of the inhabitants are Greeks and Bulgarians, the Turkish residents being mostly soldiers or officials. It carries on a large trade with Constantinople, Saloniki, Vienna, and Trieste. Pop. about 40,000.

The vilayet has an area of 10,690 square miles; pop. about 850,000.

Monazite (Greek, "solitary," in allusion to its rare occurrence), a native phosphate of the metals of the cerium group, often also containing more or less thorium silicate. It is reddish or brownish in color, with a resinous lustre, and crystallizes in the monoclinic system, though it also occurs in massive and granular forms. It is commonly translucent and brittle, with a hardness of from 5 to 5.5, and a specific gravity of about 5.0 to 5.2. It is found at Norwich, Conn., and also in the Ural district, as well as in other parts of the world. The chief commercial supply, however, comes from North Carolina and from certain parts of Brazil. In these regions monazite is a constituent of the granitic rocks, and is obtained by washing the gravels and sand that have been formed by the disintegration of those rocks. The Brazilian output has been controlled by a German syndicate since 1902, and practically all of it now goes to Europe. The monazite produced in the United States comes chiefly from Burke and Cleveland counties, North Carolina. The total production of the mineral in this country in 1901 was 748,736 pounds. Monazite owes its industrial importance to the cerium and thorium that it contains, the former being utilized for the preparation of cerium oxalate, which is used in medicine and in the arts, while the thorium is

employed in the manufacture of mantles for incandescent gas-lighting.

Monbod'do, James Burnett, Lord, Scottish judge and philosopher: b. Monboddo, Kincardineshire, October (or November) 1714; d. Edinburgh 26 May 1799. He was educated at Aberdeen, Edinburgh, and Groningen, soon became a leading member of the Scotch bar, and in 1767 became ordinary lord of session. As a judge he was able and lucid. His literary fame rests on his work 'On the Origin and Progress of Language' (1773-92), in which he held that language was a human invention traceable west from Asia, and his 'Ancient Metaphysics' (1779-99), a work held in contempt by his contemporaries, but now recognized as important in the history of philosophy, because of its praise of Greek philosophy, thus approaching Neo Kantianism, and for its treatment of man as one of the animals, suggesting in this and other respects Darwinism.

Moncheur, mōn-shēr, Ludovic, BARON, Belgian diplomat: b. Brussels 12 May 1857. He was educated at Louvain, entered the diplomatic corps, became attaché to the Belgian legation at The Hague in 1883; held posts in the legations to Vienna (1885), Berlin (1887), Rome (1892); and became minister to Mexico in 1898; married the daughter of Powell Clayton, U. S. minister to Mexico; and in 1901 became minister to the United States. He has written on the geography of Mexico and is a member of the Antwerp Geographical Society.

Monclova, mōn-klō'vā, Mexico, a town of Coahuila, the terminus of a branch line of the Mexican International railroad to Cuatro Ciénegas, 100 miles northwest of Saltillo. Monclova dates from the 17th century and was formerly the capital of the dual state of Coahuila and Texas. It has railroad works, and a trade in the agricultural produce of the region. Pop. 15,000.

Moncrieff, mōn-krēf, Sir Alexander, British ordnance expert, inventor of the disappearing gun system: b. Scotland 17 April 1829. He was educated at Edinburgh and Aberdeen; apprenticed to a civil engineer; served in the Scottish Royal Artillery; during the Crimean war planned the Moncrieff ordnance system, also called the protected barbette, or the disappearing system. The important point in this system is that the recoil of the gun is utilized to drop it out of sight after firing and to raise it again when necessary, a contrivance which did away with the cumbersome and expensive system of steel-plated forts. It substituted for them the simple, inexpensive Moncrieff pits, mere slight excavations for the masking of coast batteries.

Moncrieff, Robert Hope, 'Ascott R. Hope,' British author: b. Edinburgh 1846. He began to study for the bar but forsook law for literature and under various pseudonyms, but mainly that of 'Ascott R. Hope,' has published more than a hundred books of fiction and other works. Among them are: 'Hero and Heroine'; 'Homespun Stories'; 'Ready Made Romance'; 'Tales for Toby'; 'Album of Adventure'; 'Wigwam and Warpath.'

Moncton, mōn'k'tōn, Canada, a city and port of entry in Westmoreland County, New

Brunswick, at the head of navigation of the Petitcodiac River, a tidal stream entering the Bay of Fundy; and on the Intercolonial railway, 86 miles northeast of Saint John, and 185 miles northwest of Halifax. It has a good harbor and an extensive trade in lumber and produce. The tide in the Petitcodiac estuary is one of the most remarkable in the world, coming in with a bore from 4 to 6 feet high and rising to a maximum height of 70 feet. The offices and chief workshops of the Intercolonial railway are here, and there are manufactures of sugar, cotton and woolen goods, leather, woodenware, tobacco, etc.

Mond, mōnd, Ludwig, English manufacturing chemist: b. Cassel, Germany, 7 March 1839; d. 11 Dec. 1909. He was educated at the Cassel Polytechnic and the Universities of Marburg and Heidelberg; went to England in 1862, to enter the employ of the Leblanc soda works, where he introduced his method of recovering sulphur from alkali waste; in 1873 introduced the Solvay process of manufacturing ammonia soda, into England; and continually improved this process. He invented a means of manufacturing chlorine as a by-product of the ammonia soda process, and devised new gas-batteries, new processes for manufacturing nickel, based upon his discovery of nickel carbonyl, and a new method of producing gas for power and heating, ammonia being a by-product. In 1896 Mond endowed the Davy-Faraday Research Laboratory at the Royal Institution.

Mon'day (moon and day; Saxon, *Monan-dæg*; German, *Montag*; Latin, *luna dies*), the second day of the week, formerly sacred to the moon. See CALENDAR.

Mondovì, mōn-dō-vē', Italy, an episcopal city in the province of Cuneo, 58 miles by rail south of Turin. Its chief building is the 15th century cathedral of San Donato. Silk, cloth, paper, pottery, machinery, etc., are among its manufactures, and it has a school of industrial arts and handicrafts. Near the city the Sardinians were totally defeated by Napoleon 22 April 1796.

Mo'ner, the simplest form of protozoan, and regarded as the simplest known animal organism. It was made by Haeckel the type of a separate group (*Monera*), characterized chiefly by lack of nucleus, but further investigation showed that the moners had no just right to this distinction, and they are included among the rhizopods in the order *Lobosa*. One of the forms most frequently met is *Protoamœba*. Consult: Haeckel, 'History of Creation' (1876); Parker and Haswell, 'Text-book of Zoology' (1897).

Monet, Claude, klōd mō-nā, French impressionist painter, leader of that school: b. Paris 14 Nov. 1840. He was reared in Havre. To coax him out of his love for art he was allowed to enter the army; but his first glimpses of Algiers made him more the artist than before. At 22 he resigned from the army; began to study art; worked under Gleyre in Paris; soon broke with his master, who would not allow him to draw what he saw; and became a plein-airist and for the time a follower of Boudin, a French marine painter. The Salon was rigidly closed to his pictures, and as he grew in power he soon lost all traces of academic influence, even that of the Barbizon School, and became the first

of the impressionists. He painted a few interiors, but was more at home in his landscapes. In these he made the most conscientious effort to reproduce exactly light and atmosphere, working on one canvas day after day at the same hour for a short time under practically identical conditions of lighting and air. This habit is the more interesting because of Monet's series of pictures, each series showing the same natural object in different settings of light and atmosphere—for example, his scores of 'Haystacks' or the many pictures of Rouen Cathedral. He was the first to use the unmixed tones in painting "vibrating light" and is particularly fond of blue and yellow as color themes. Maupassant said of him that he "discovered the art of painting." His best canvases are 'The Mouth of the Seine,' 'Lavacourt,' 'Bordighera,' 'The Orchard,' and 'Snow of Port Villera.' More than a score of his paintings belong to Americans and were exhibited at the Lotus Club, in January 1899.

Moneta, in Greek mythology, a name applied to Juno, known as the goddess of coin or money.

Monetary Commission of the United States Congress, a commission appointed in August 1876, by the 44th Congress, to inquire into the causes and economic effects of the decline in silver, the best means for resuming specie payments and other national monetary questions. The commission consisted of three Senators, three Representatives, and three monetary experts. Meetings were held in Washington and New York, during a period of six months. The results of these conferences were published by the government in monographs issued by the Treasury Department. See **MONEY**.

Monetary Conventions, conferences between European nations, for the regulation of their coinage. Two of such conventions have been held, the 'Latin Monetary Convention,' and the 'Scandinavian Monetary Convention.' The former includes France, Belgium, Italy, and Switzerland, the agreement having been made in December 1865, in virtue of which the coinages of those countries are of the same weight and fineness. Greece subsequently joined the convention, and assimilated her drachma to the franc. Spain, Austria and Hungary, Finland, Rumania, Servia, Bulgaria, and Monaco have also coined large amounts of either or both gold and silver money, of weight, fineness, and value, exactly proportionate to, or identical with that of the countries included in the convention. Since 3 Aug. 1892, the gold standard has prevailed in Austria, and since 1 Oct. 1897, in Japan. The 'Scandinavian Monetary Convention' dates from 1873, and includes Norway, Sweden, and Denmark. See **MONEY**.

Monetary Systems of the World. The precious metals having been used as money by weight, it naturally followed that monetary systems developed along the same lines; originally the names of coins and units were the same as those of weights. Surviving examples of this are found in the *peso* of Spanish-American countries, the *lira* of Italy, the *mark* of Germany, and the *pound sterling* of Great Britain. The British monetary system, indeed, continues to this day the duodecimal feature of the troy system of weights, the *£* having in ancient days

been a pound troy of silver, and the penny $\frac{1}{240}$ thereof, or a penny-weight. Even in the fineness of the coins the rule continues to prevail there, after almost every other civilized nation has adopted the decimal system; the British fineness for gold is 22 carats, $\frac{22}{24}$ (or $\frac{11}{12}$), expressed also .916 $\frac{2}{3}$; the standard for silver is the old sterling $\frac{11}{12}$, or .925. The relation between the value of metals was formerly fixed arbitrarily; the commercial value now regulates the ratio.

National traditions, inherited methods, commercial relations, and political considerations have all materially influenced the development of the systems. Thus in the United States, in the colonial period, the British system prevailed in theory; actually the *shilling* of the mother country had a different value, the Americans having followed in great measure the Spanish system of the "piece of eight," subsequently called the *dollar* of eight *reals*; and the "York shilling" was thus 12 $\frac{1}{2}$ cents, whereas the British shilling had nearly twice that value. When the colonies became independent their new system largely followed the Spanish. In more recent times we find Portugal adopting the British fineness for her coinage; and Russia, a short time ago, modified her system slightly, to bring it into relation with the French. Colonies usually follow the systems of the mother countries; but the influence of commercial relations with neighboring countries is strong; as is well known, the Dominion of Canada uses the dollar system in preference to the British, both being legally permitted.

Monetary systems and terms persist with peculiar tenacity; in the United States the "bit" or eighth of a dollar is still used colloquially in the West and South; in British Guiana the old Dutch measures of value are still in vogue, although Holland lost that piece of territory several generations ago; in the Orient the Spanish-Mexican dollar is preferred to all other coins by nearly 500,000,000 people; in Abyssinia and vicinity the Levantine dollar continues to be provided by Austria, just as in 1780, when Maria Theresa reigned, the coins being struck with the old date and portrait; in British India the ancient rupee can never be superseded.

The nations of the world are classifiable roughly into four groups, respecting the values of their units; the first using large units, such as the pound, equivalent to about \$5; the second having approximately the dollar unit; the third having units about one half the dollar, caused by the fall in the price of silver to one half its former rating; fourth, those using a measure approximately equal to the *franc* or *mark* (20 to 25 cents).

A further, and more important, classification arises from the metal used as the basis or standard; we have thus a group using gold only for full legal tender money, silver being merely subsidiary; there is another group, also employing the gold standard, but having a substantial amount of silver coin possessing equal legal tender functions with the gold coins; then the countries which have adopted the gold standard, but actually use silver coins only; and lastly, those having the silver standard, where gold is not a tender. A fifth class might be added, temporarily at least, composed of countries with nominally one or the other of the standards,

but actually using depreciated paper, having hence a fluctuating standard.

Where the unit in gold would make too small a piece for practical purposes, it is not actually coined, only multiples thereof being used; thus the dollar of the United States, the franc, etc. All countries use silver for divisional or subsidiary pieces, and for the smallest transactions coins of 75 per cent copper and 25 per cent nickel, but called nickel, and of 95 per cent copper and 5 per cent tin and zinc, constituting bronze, are supplied. These pieces are almost invariably worth less intrinsically than their nominal value, being purposely more or less debased to prevent exportation. Some nations lower the value of subsidiary silver pieces by reducing the weight, others by lowering the fineness. Since practically all nations provide for the exchange of the divisional for full tender pieces, the former are maintained at their nominal value. The quantities furnished are limited to the estimated local needs. The legal tender power of the subsidiary silver pieces is usually about \$10, and of the nickel and bronze about 25 cents. In countries where exceeding thrift or great poverty prevail, the smallest divisional piece represents a very small fraction of the unit.

Formerly both gold and silver bullion could be taken to the mints and coined into pieces; but since the great fall in the commercial value of the white metal its coinage is limited.

The value of the money of the silver standard countries is, in international relations, therefore regulated by the market price of silver. The standard for silver coinage in the United States is at the rate of \$1.29.29 per ounce fine; since the ounce is, however, worth less than 60 cents currently, the bullion value of the silver dollar is less than 50 cents; but having full legal tender power in the United States, it circulates at its full nominal value of 100 cents. The Mexican dollar, or peso, is rated in the United States at about 50 cents, for, although it contains more silver than that of the United States, it has no debt-paying power there. Not so with gold coins, which the world accepts at their intrinsic value, herein measured, for convenience, by the grain of gold. The value of a grain of pure gold at the United States coinage rate is a very small fraction in excess of 4.3 cents, since gold is coined at the rate of 23.22 grains to the dollar; all gold and silver coins are alloyed with copper; thus there is added to the gold 2.58 grains of copper giving a total weight of 25.8 grains, with a fineness of .900.

Practically all nations use, also, one or another form of paper representatives of money, issued under varying governmental supervision; these are classifiable as (a) notes issued directly by the governments, (b) certificates of deposit for coin, (c) notes issued by banks or bankers. While bank-checks constitute a very large part of the instruments of exchange, they are not properly to be included herein as money.

In the following presentation of the monetary systems, the values of the units are given in money of the United States, those of the silver pieces at the coinage rate for silver dollars, rather than in the temporary market value of silver bullion. The actual value of any silver piece may be found by using the day's quotation for the ounce of fine silver, in New York, in

cents, and applying the coinage rate above given. Thus the Mexican peso is equivalent to \$1.0159; if silver is quoted at 58 cents, the rule would be 1.29.29 : .58 :: 1.0159 : *x*. It is to be borne in mind, however, that in all except the silver-standard countries the subsidiary silver coin is maintained at parity with the gold unit, irrespective of its bullion value.

United States: dollar (\$) = 10 dimes, each of 10 cents, each of 10 mills; bimetallic system. Standard gold unit 23.22 grains coined at .900 fine, into double-eagles (\$20), eagles (\$10), half-eagles (\$5), and quarter-eagles (\$2.50). Standard silver unit, 371.25 grains pure metal, coined at .900 fine (*actual coinage suspended*); ratio = 371.25 : 23.22 :: 15.988 : 1, and commonly called 16 to 1. Subsidiary silver 50, 25, and 10 cents; contents, 347.22 grains to the dollar, coined at .900 fine, hence equivalent at the coinage rate to 93.5 cents. Minor coins, 5 cents, of nickel, 1 cent, of bronze. The mill has never been expressed in coinage, and practically never used in accounts, although up to 1857 there was a 5-mill or half-cent piece.

Paper money is issued in all three classes: government notes secured by gold reserve; government certificates of deposit (1) for gold coin and (2) for standard silver dollars; bank notes secured by deposits of bonds with the government. Denominations as low as \$1 are in use, in lieu of coin, the habit having been formed during the period of, and after, the Civil War, when the standard was depreciated paper.

EUROPE.

Great Britain: pound sterling (£) = 20 shillings, each of 12 pence, each of 4 farthings. Standard, gold; unit, 113.001 grains, value \$4.86 $\frac{1}{2}$, coined at .916 $\frac{2}{3}$ fine; in pounds (colloquially *sovereigns*) and half-pounds. Silver, subsidiary only; shilling contains 80.73 grains pure metal, equivalent to 21.7 cents, nominal value 24 $\frac{1}{2}$ cents. Coined at .925 fine into crowns (5 shillings), half-crowns (2 $\frac{1}{2}$ shillings), florins (2 shillings), shillings, six-pences ($\frac{1}{2}$ shilling), and three-pences ($\frac{1}{4}$ shilling). Minor coins of bronze, 1 penny, $\frac{1}{2}$ penny, and farthing.

Paper money is issued by banks only, a certain fixed portion secured by bonds, the remainder only on actual deposits of gold; so that current issues are practically gold certificates. By far the greater part of the issue is made by the Bank of England, and its smallest denomination is £5. Some local banks issue £1 notes in limited amounts. The British mint coins money for most of the colonies.

France: franc = 100 centimes. System bimetallic; gold unit 4.48 grains, value 10.3 cents; coined at .900 fine into 100, 20, and 10 francs. Standard silver unit 69.44 grains, equivalent to 18.7 cents; coined at .900 fine, into 5-franc pieces only, which are exactly equivalent to two half-dollars; actual coinage suspended; ratio 15 $\frac{1}{2}$ to 1. Subsidiary silver pieces 64.43 grains to the franc, equivalent to 17.3 cents, coined at .835 fine into 2, 1, and $\frac{1}{2}$ francs. Minor coins are 25 centimes of pure nickel, bronze, 10, 5, and 2 centimes; centime (nominally .193 of a cent) not coined for use.

Paper money is issued only by the Bank of France; the maximum limited, but secured

MONETARY SYSTEMS

solely by assets of the bank; no special reserve; the chief officers of bank are appointed by government.

The French system is in use by the four other countries first mentioned below, constituting, with it, the Latin Union; it is, furthermore, adopted in several other countries in Europe and adapted by many others elsewhere, being the system most prevalent in the world. The French mint coins money for other nations.

Italy: *lira* = 100 *centesimi*. Unit = 19.3 cents; system identical with French. Paper money issued by three banks, secured by their assets, but required to have a coin reserve; government also issues notes secured by a coin reserve.

Belgium: *franc* = 100 *centimes*. Unit = 19.3 cents; system identical with French; paper money issued by one bank, modeled after the Bank of France.

Switzerland: *franc* = 100 *centimes*. Unit 19.3 cents. System identical with French; 36 banks issue paper money secured by their assets, but a fixed 40 per cent reserve is required.

Greece: *drachma* = 100 *lepta*. Unit = 19.3 cents; system identical with French, but *depreciated paper* standard prevails with gold at about 130. The notes are issued by one bank, similar to that of France, and by the government.

Spain: *peseta* = 100 *centimos*. Unit 19.3 cents; system practically identical with the French, but *depreciated paper* standard prevails with gold at about 131. One bank issues the paper money, secured by its assets, and nominally required to maintain a 25 per cent coin reserve.

Monaco uses, besides the French pieces, a special coin of 100 francs, coined at the Paris mint.

Serbia: *dinar* = 100 *paras*. Unit 19.3 cents. French system adopted. One bank issues paper money, secured by assets, with 33 1/3 per cent reserve in coin. There is a slight discount against the notes.

Bulgaria: *lev* = 100 *stotinki*. Unit 19.3 cents. French system adopted. One bank issues notes.

Rumania: *lei* = 100 *bani*. Unit 19.3 cents. French system adopted, but gold coin alone is standard money; one bank issues paper secured by assets and a 40 per cent coin reserve.

Germany: *mark* = 100 *pfennige*. Standard gold; unit 5.53 grains, value 23.8 cents; is coined at .900 fine into 20- and 10-mark pieces. Silver subsidiary only; mark contains 77.16 grains pure metal, equivalent to 20.8 cents; coined at .900 fine in 5, 2, 1, and 1/2 marks. Minor coins of nickel 10 and 5 pfennige, and of bronze, 2 and 1 pfennige. Paper money is issued in limited amount by the government upon an equal sum of coin in the "war chest," thus nominally gold certificates, but not actually redeemable. The bulk of the notes are issued by banks, chiefly the Imperial; maximum sum graduated so that any excess over thrice the coin reserve is taxed 5 per cent; the assets secure the notes.

Austria-Hungary: *krone* (crown) = 100 *heller*; standard, gold; unit of 4.7 grains, value 20.26 cents; coined at .900 fine into 20- and 10-kronen pieces. Subsidiary silver coin at 64.43 grains to the krone, equivalent to 17.3 cents, coined at .835 fine into 5- and 1-kronen pieces. Minor coins of nickel 20 and 10 heller, and of bronze 2 and 1 heller; the latter nominally one

fifth of a cent. One bank issues paper money, secured by assets and a fixed coin reserve.

Austria still coins, for the Levantine trade, Maria Theresa silver *dollars*, 833 1/3 fine, containing 372.7 grains pure metal, equivalent to \$1.004; and gold *ducats* and quadruple ducats, the former containing 53.1 grains of pure metal, value \$2.288, coined at .986 1/9 fine, the highest degree of fineness used in coinage.

Sweden: *krone* = 100 *öre*; standard, gold; unit contains 6.22 grains, value 26.8 cents; coined at .900 fine in 20-, 10-, and 5-kronor pieces. Subsidiary silver is coined at .800, .600, and .400 fine, hence the pieces vary in intrinsic value. The silver krone contains 92.59 grains pure metal, equivalent to 24.9 cents. Minor coins are of bronze, the 1-öre piece being nominally 1/4 cent. Notes are issued by several banks, the chief one being the property of the government; the issues are secured by assets.

Norway: System identical with that of Sweden. Notes are issued by one bank controlled by the government, secured by assets, but with a 50 per cent coin reserve.

Denmark: System also identical with that of Sweden. One bank issues paper money secured by assets, and to an amount governed by the coin reserve.

Netherlands: *florin* (*guilder*) = 100 cents or *stuivers*. System bimetallic. Gold unit is 9.33 grains, value 40.2 cents, and coined at .900 fine into 10-florin pieces. The silver unit is .945 fine, contains 145.83 grains pure metal, hence equivalent to 39.3 cents. There is a *rixdaler* (equals 2 1/2 florins), a florin, and a half-florin. Subsidiary pieces are .640 fine and not proportional in weight. Minor coins of bronze 2 1/2, 1, and 1/2 cents. Both the government and one bank issue notes, with ample reserve. *Ducats* and double ducats are coined for the Far Eastern trade. The value of the former is slightly less than that of the Austrian.

Russia: *ruble* = 100 *copecks*. Standard, gold. Unit contains 11.95 grains, value 51.46 cents; coined at .900 fine into 10- and 5-ruble pieces; 37 1/2 rubles = 100 francs. Subsidiary silver is coined with the ruble, containing 277.72 grains pure metal, equivalent to 74.8 cents; actually, of course, only 51.46 cents. (Thus the silver ruble occupies an anomalous position, for, should the market value of silver rise sufficiently, the silver ruble would be worth more than that of gold.) The ruble and half-ruble are coined .900 fine, but smaller silver pieces, 20, 15, 10, and 5 copecks, are only .500 fine. Minor coins are 3-, 2-, 1-, 1/2-, and 1/4-copeck pieces, of bronze. Paper money is issued by the Imperial Bank, owned by the government and a part of its finance department. A coin reserve is maintained.

Finland: *markka* of 100 *penni*, formerly; unit = 19.3 cents, being in accord with the French system, although the gold standard prevailed. Now superseded by the Russian system.

Turkey: *lira* or *pound* (£T) = 100 *piasters* of 40 *paras*. The unit, locally called the *medjidie*, contains 102.08 grains of gold, value \$4.356, coined at .916 2/3 fine into 5-, 2 1/2-, 1-, 1/2-, and 1/4-lira pieces. The piaster of silver contains 15.40 grains pure metal, equivalent to 4.2 cents; coined at .830 fine, the pieces being 5, 2, and 1 piasters; the para has a nominal value of .11 of a cent, and is also divided into 3 *aspes*, giving

MONETARY SYSTEMS

each of the latter a value of .036 of a cent. Paper money is issued by the Ottoman Bank, chartered in England, on actual gold on hand only.

Portugal: *milreis* = 1,000 *reis*. Standard, gold, the unit containing 25.088 grains pure metal, value \$1.08, coined at .916 $\frac{2}{3}$ fine into *crowns* (10 *milreis*), 5, 2, and 1 *milreis*. Subsidiary silver, *milreis*, or 10 *testones*, of 353.66 grains pure metal, equivalent to 95.26 cents; coined at .916 $\frac{2}{3}$ fine into 1, $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{10}$, and $\frac{1}{20}$ *milreis*. Minor coins of nickel, 100 and 50 *reis*, of bronze 20, 10, and 5 *reis*. Depreciated paper money prevails, issued by one bank. Gold premium $\frac{3}{4}$ per cent.

ASIA AND OCEANIA.

China: *tael* = 1,000 *cash*, nominally; standard is silver; there are 25 or more varieties of the *tael*, which is actually a weight; a small bar of silver duly stamped is the medium. The *haikwan tael* used for customs payments is generally the standard; the others vary $\frac{1}{4}$ to $\frac{1}{3}$ per cent in value measured thereby. The *cash* is a coin of base metal with a square hole in the middle, through which it is strung on cords; latterly 1,600 to 1,800 are reckoned to the *tael*. The theoretic division is 10 *hon* = 1 *sen*, 10 *sen* = 1 *hoo*, 10 *hoo* = 1 *cash*, 10 *cash* or *li* = 1 *condarren*, of which 10 = 1 *mace*, of which 10 = 1 *tael*. The *haikwan tael* contains 590.35 grains pure silver, equivalent to \$1.59 (actually less than 70 cents); thus the *cash* is nominally $\frac{1}{10}$ of a cent. The Mexican *peso* is the best-known coin, accepted everywhere; the British *dollar* also circulates; and the mints established in 1890 have been coining a few dollars like the British, and divisional silver pieces of 50, 20, 10, and 5 cents, as well as copper 1-cent and smaller pieces, which are gradually finding their way into use. Hong Kong and local bank notes are used; the Chinese having first used paper money long before the Christian era. The *cash* is found mentioned in records as far back as they go, say 2354 B.C.

Korea: *liang* = 100 *cash*; no definite standard; all sorts of coins circulate; the Japanese system is being introduced now, including bank-notes, which never before existed. Local coins are of nickel and the brass *cash*.

Japan: *yen* = 100 *sen*, each of 10 *rin*; standard is gold, the unit containing 11.57 grains of pure metal, value 49.8 cents; coined at .900 fine into 20-, 10-, and 5-yen pieces. Subsidiary silver coins are .800 fine, the 50-sen piece containing 166.40 grains pure metal, equivalent to 44.8 cents. Minor coins are 5 *sen*, of nickel, 1 *sen* and 5 *rin*, of bronze. Paper money is issued by the Bank of Japan, secured by assets, with a gold reserve.

Philippine Islands: *peso* of 100 *centavos* each; the government has just introduced the new gold standard system to supersede that of the Mexican *peso*. The gold *peso* contains one half the gold in the dollar of the United States, hence 11.61 grains pure; not coined, however; value 50 cents; silver currency is almost exclusively used; the silver *peso* contains 374.4 grains of pure metal, coined at .900 fine, hence not quite so good as the Mexican; and equivalent to \$1.008, hence an anomalous piece; it has full legal tender power. Subsidiary silver pieces are exact subdivisions, 50,

20, and 10 *centavos*; nickel 5-centavo pieces and 1 and $\frac{1}{2}$ *centavos* of bronze are provided; the last mentioned is nominally $\frac{1}{4}$ cent. Certificates of deposit for silver *pesos* in denominations of 2, 5, and 10 *pesos* are in use, issued by the government, and banks issue notes secured by coin in hand. To facilitate the introduction of the new system Mexican *pesos* and other coins are outlawed; a gold guarantee fund is established to maintain the arbitrary parity of 2 for 1.

Hong Kong: *dollar* = 100 *cents*; standard is silver. This important, although small, colony of Great Britain uses the British *dollar* designed to supersede the Mexican *peso*; it contains 374.4 grains of pure silver, equivalent to \$1.008, and with half-dollars, is coined at .900 fine, while 20-, 10-, and 5-cent pieces are only .800 fine. Minor coins are of bronze; cents, $\frac{1}{2}$, $\frac{1}{4}$, and $\frac{1}{10}$ cents are provided. Mexican *pesos* circulate as freely as these dollars. Paper money is issued by banks under British charters, based upon assets; the notes are used throughout the Orient.

Straits Settlements: Had the same system as Hong Kong, including the notes; but the government has decided to introduce the system in use in the Philippines.

French Indo-China (Tongking, Annam, and Cambodia): *piastre* = 100 *cents*; standard is silver; unit contains 375 grains pure silver, hence better than the *peso* or the *dollar*; equivalent to \$1.01, coined at .900 fine. Divisional pieces of $\frac{1}{2}$, $\frac{1}{4}$, and $\frac{1}{10}$ *piastres* are coined, also minor coins of bronze of 1 and $\frac{1}{2}$ cents, the latter known as *sapeque*. A bank under French charter issues notes secured by assets.

Siam: *tical* = 4 *salungo*, each of 2 *fuang*, each equal to 800 *cowries* (shells). Standard is silver, the unit being a bent bar of 212 grains pure metal, equivalent to 60 cents. Minor coins of copper are taking the place of the *cowries*: *seek* ($\frac{1}{2}$ *fuang*) = 2 *poi*, each of 2 *att*, each of 2 *solot*, the latter nominally $\frac{1}{2}$ cent silver. Mexican *pesos* are largely used, rated at $\frac{1}{4}$ *ticals*. An attempt to fix a gold standard with the *tical* rated at 26 cents is under way. Several foreign banks, and also the government, issue paper money.

British India: *rupee* = 16 *anna* of 4 *pice*, each of 3 *pie*; standard is now gold ($\frac{1}{2}$ = 15 *rupees*); the currency is, however, silver, the unit containing 165 grains of pure metal, equivalent to 32.44 cents, which is the arbitrary nominal value as well; maintained, as in the Philippines, by a gold reserve fund; coinage is .916 $\frac{2}{3}$ fine; pieces of 1, $\frac{1}{2}$, $\frac{1}{4}$, and $\frac{1}{8}$ *rupees* are struck; and bronze pieces of $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, and $\frac{1}{12}$ *anna*, the smallest nominally equal to .0016 cent. Paper money is issued by the government, notes being fully covered by coin and government bonds.

Ceylon: Has substantially the same system, dividing the *rupee* into 100 cents.

Mauritius: Also has the *rupee* system, divided as in Ceylon.

Portuguese India: Uses a half-*rupee*, known as the *avalla*, of 5 *tangas*, each of 60 *reis*.

Java: Sumatra: Celebes: Use the Netherlands' system of florins, and a bank chartered by the home government issues paper money secured by assets and 40 per cent coin reserve.

Borneo: Nominally uses a *dollar* of 100

MONETARY SYSTEM

cents; few coins except cents and half-cents of bronze are in use, except in Sarawak, where divisional silver pieces have been supplied.

Samoa: Uses British, German, and United States coins.

Australia: £=20 shillings of 12 pence, each of 4 farthings; the British system is used completely, paper money being issued by banks chartered in England, the notes fully covered by coin. Local mints coin gold; smaller coins are furnished from the British Mint.

Fiji and New Guinea: Are using chiefly British silver and bronze money, but in the German part of the latter the mark system prevails with a distinct coinage.

Hawaii: Has the system of the United States complete.

Persia: *toman* = 10 *krow*s of 20 *shahis* of 50 *dinars*; the *kran* is the actual standard unit, and is of 64 grains pure silver, equivalent to 17.2 cents. The *toman* is supposed to contain 39.583 grains of pure gold, hence worth \$1.704. There are divisional and minor coins, the *abassi* of 4 *shahis*, each of 2 *pais*; the last mentioned is nominally .0042 cents. A bank issues notes on assets secured by 30 per cent reserve; gold is at a premium of 95 per cent.

Afghanistan and Baluchistan: Have no systems, but had used rupees almost exclusively until Russian influences introduced the ruble.

Turkestan and Bokhara: Have become Russianized.

Arabia: Has only nominally a system, the Maria Theresa dollar being divided into 80 *cabir*.

Siberia: Is, of course, entirely Russian.

Tibet: Retains the old Chinese system, though little money exists.

AFRICA.

Egypt: £E=100 *piastres* of 10 *ochr-el-guerche*; the standard is gold, the unit being the largest in the world, containing 114.778 grains of pure metal, coined at 875 fine, value \$4.943; not much gold is actually used; silver is coined in 20-, 10-, 5-, 2-, and 1-piastre pieces, at .833⅓ fineness, making the piastre, containing 18 grains pure metal, equivalent to 4.9 cents. Minor coins are the 1 piastre and 5, 2, 1, ½, and ¼ *ochr-el-guerche*, the larger ones of nickel, the latter two of bronze. The smallest coin is equal to ¼ of a cent. Paper money is issued by one bank, secured by coin and bonds.

Abyssinia: Still uses the old Austrian dollar of 1780 and rupees; but under Italian influence it and

Eritrea: Have come to use a new dollar, with halves, quarters, and tenths; the dollar known as *talori*, being equivalent to 5.2 francs or \$1.0036. Standard is silver.

Zanzibar: Also uses the old coins, but in addition a *dollar* of its own, with 5- and 2½-dollar pieces in gold, 1, ½, and ¼ in silver; all are .900 fine. There is a copper piece, *pesa*, which is the chief circulating medium away from the cities on the coast.

Mozambique: Also uses the Austrian dollar and rupees, but Portugal is introducing a system adapted from its own. The *barinh*o, equal to 26½ reis, is the chief piece.

German East Africa: Has a *rupes* divided into 100 *keller*, of silver, equivalent to .888 cents; also bronze minor coins.

Madagascar: Has now the French silver system practically complete.

Natal: Has the British system intact, with British chartered banks issuing notes fully covered by coin. The standard is, of course, gold.

Cape Colony: Likewise has the British system unmodified, which now reaches into the

Transvaal or British South Africa: But the former (Boer) system was also British.

Interior Africa: Has a fondness for copper pieces, and tons of these coins have been sent there; some silver also enters, rupees being largely used.

Kongo: Under Belgian influence, uses the Latin Union system, but only silver and bronze coins are furnished, the latter having a circular hole in the centre for stringing; 1-centime pieces are included in the supply.

Saint Helena: Has British money.

Sierra Leone, Lagos, Gambia, and the Gold Coast use British money also, but, because of the adjoining French colony of

Senegal: The French coins are equally received; the same is true of

Liberia: Which has nominally the dollar of the United States as the standard.

These countries use little gold, more silver and large amounts of copper coins.

Morocco: Nominally has the *rial* of 10 *okia*, or ounces, of 4 *blanheels*, of 6 *floors* each. The rial is sometimes called the piastre and is equal to about 5 francs; in fact, French money circulates owing to the proximity of France's colony of

Algeria, which has the Latin Union system in full, with a large bank of issue modeled upon the lines of the Bank of France. This franc system is gradually extending into

Tunisia, which formerly had a modified Turkish system of a *piastre* divided into 16 *karobs*, the unit equal to about 11⅓ cents, and of silver. Under the French régime the piastre is made equal to ¼ of a franc.

Tripoli: Has not yet fully succumbed to modern systems, still retaining nominally a modified Turkish one of the silver *mahbub* of 20 piastres.

Malta: Has now the British system.

Cyprus: Where the British system was introduced, has gone back to the piastre of Turkey, with a value of 1½ pence to the unit.

AMERICA.

Canada: *dollar* = 100 *cents*. £=\$4.86⅔. The standard is gold, but there is no gold coinage, the needed coins coming from the United States or Great Britain under the theoretically dual system. Actually the dollar system has become almost universal. Subsidiary silver pieces of 50, 25, 10, and 5 cents are provided, at .925 fineness; they contain 331.75 grains of pure silver to the dollar, hence equivalent to 89.2 cents. A 1-cent bronze piece is the sole minor coin. Paper money is issued by the government, secured by gold and bonds, but much more generally by banks, secured by assets and a redemption fund.

Newfoundland: Always erratic, has also a *dollar* of 100 *cents*, but its unit is 23.54 grains of pure gold, value \$1.014, coined at .916⅔ fine, into a \$2 piece only. The standard is gold: subsidiary coins of 50, 25, 10, and 5 cents; the minor coin is a bronze cent.

MONETARY SYSTEMS

The British West Indies: Have the British system, modified, however, by that of the United States, with subsidiary coins of the shilling divisions, including a 4-penny silver piece. A British chartered bank furnishes notes fully covered by coin. This category includes the

Bahamas, Bermuda, British Honduras, British Guiana, Jamaica, and the lesser islands belonging to the British, namely, Barbados, Trinidad, Saint Kitt's, Antigua, Dominica, Grenada, Saint Lucia, Saint Vincent, Tobago, and Turk's Island.

Martinique and Guadeloupe: Have the French system; so also have, nominally,

Saint Pierre and Miquelon, near Newfoundland, and French Guiana.

Saint Thomas and Santa Cruz: Use Danish money, as do also

Greenland and Iceland, what little is needed there.

Dutch Guiana and Curaçao use the Netherlands system.

Porto Rico has the United States system in full.

Cuba: Has not yet eliminated the old Spanish-Mexican composite system, but has substantially adopted that of the United States. The old system included the ancient doubloon of gold, of 365.46 grains pure, value \$15.74, coined at .875; the peso of 8 reals for silver, and the peseta system of Spain. There was also an Isabella doubloon of \$5.013½. Minor coins of bronze are 10, 5, 2, and 1 centimos, the largest nominally 1.9 cents.

San Domingo: Has also adopted the dollar system of the United States. It still uses the division into centavos.

Haiti: However, retains the French, only slightly modified in that the unit, *gourde*, exactly 5 francs, is divided into 100 cents. United States gold is also legal tender; but depreciated paper money is the standard, gold being at 118 to 150 premium.

Mexico: *peso* = 100 centavos; new standard is gold, currency is silver. The standard theoretic unit is 11.57 grains of pure gold, value 49.9 cents; the silver peso is 377.18 grains pure silver, coined at .9027 fineness, the ancient Spanish standard, equivalent to \$1.016. Subsidiary pieces are exact subdivisions, and are coined in 50, 25, 10, and 5 centavos. There is also a bronze centavo piece. Numerous banks issue notes fully secured by coin. The importance in the commercial world of the peso, which began its career over four centuries ago, is now disappearing; the records show that 3,500,000,000 of these pieces have been coined at the Mexican mints, most of them having been exported. The history of this coin is unique.

Nicaragua: *peso* = 100 centimos; the standard is silver, the unit containing 347.23 grains of pure silver, equivalent to 93.5 cents, hence substantially modeled upon the French system, the peso being exactly equal to the 5-franc piece. Pesos, ½, and ¼ pesos are coined at .900 fineness, but the 10- and 5-centimos pieces at .835. The minor coin, 1 centimo, is of nickel. The government and banks issue paper money which is depreciated; and gold coins also circulate, those officially coined being the *onza* or *doubloon*, of 365.46 grains pure gold, value \$15.74, which, with the ½ onza, is coined at .875 fine, the old Spanish standard. There are also 20-, 10-, 5-

and 2-peso gold pieces at .900 fine, pure contents 22.40 grains to the peso, value 96.5 cents.

Honduras and Salvador: Have the same system.

Guatemala: Same system in theory, but depreciated paper is the standard, and for divisional pieces the *real* (one eighth of the old Spanish dollar) and fractions thereof, coined in nickel, are in use.

Costa Rica: *colon* = 100 centimos. Standard, gold; unit 10.806 grains pure, value 46.5 cents; coined at .900 fine into 20-, 10-, 5-, and 2-colon pieces. Subsidiary silver, 50, 25, 10, and 5 centimos are coined at .750 fine, and there is a nickel centimo piece.

Panama: *balboa* = 2 pesos of 100 centavos. Standard is gold, the unit being the exact counterpart of the dollar of the United States; the peso is of 347.22 grains pure silver, equivalent to 93.5 cents, hence upon the French model Coinage is at .900 fine, and there are subsidiary pieces exact subdivisions of the peso. Of course the actual value of the peso is 50 cents, although it contains twice as much silver as the half-dollar of the United States.

United States of Colombia: *peso* = 10 decimos of 100 centavos each. Standard is depreciated paper. Gold standard adopted with the dollar system; peso of 23.22 grains pure gold, value \$1, eventually to be coined at .900 fine into 10-peso pieces; silver coins are based upon the French system, the peso of 347.22 grains pure, equivalent to 93.5 cents; fineness .900; 2-, 1-, and ½-decimo pieces .835 fine, the largest containing 64.43 grains pure silver, equivalent to 17.3 cents. Gold has been quoted as high as 25,000 per cent premium, but is now rapidly nearing parity.

Venezuela: Has the French system modified: the peso or *venezolano* of 5 bolivars of 20 centavos each; the peso in gold, 96.5 cents; in silver, 93.5 cents; thus the bolivar is the same as the franc. Standard nominally bimetallic. Subsidiary coins are identical with Colombia's.

Ecuador: Gold standard adopted but silver currency still prevails; the same peso or unit in silver as the preceding, equivalent to 93.5 cents; called the *sucre* of 5 pesetas, each of 2 reals, each of 10 centavos. Divisional coins are .900 fine, making the peseta equivalent to 18.7 cents. Standard, actually depreciated paper. There is a gold coin of 10 sucres, containing 113.001 grains pure metal, hence equivalent to the pound, \$4.86½, but it is coined at .900 fine. Banks issue the paper money, which is at 50 per cent discount as to gold.

Bolivia: The same Frenchified peso, equivalent to 93.5 cents; silver standard; unit called the *boliviano* of 100 centavos; divisional pieces are of the same fineness as the unit, .900.

Peru: Has the same system, the peso called the *sol*, of 10 dineros, each of 10 centavos; equivalent to 93.5 cents. All coins are .900 fine. No paper money permitted. A gold coin called the *libra* (pound) *peruana*, containing 113.001 grains pure metal, value \$4.86½, is coined at .916½ fine; also a half-pound

Argentina: *Peso* = 100 centavos; nominally bimetallic, actually on depreciated paper basis. Unit in gold the same as the 5-franc piece, value 96.5 cents, in silver 93.5 cents. Gold coins are the *argentine*, equal to 25 francs, and half argentine; all coins are .900 fine, hence the silver coin like the 1-franc piece is equivalent to 18.7

MONETITE—MONEY

cents. Nickel 20, 10, and 5 centavos, bronze 2 and 1 centavos. The government issues paper money; the discount is 56 per cent.

Chile: *Peso* = 100 *centavos*; gold standard, radically changing the ancient value of the unit which has 8.475 grains pure gold, value 36.5 cents; the gold coins are .916 $\frac{2}{3}$ fine and are the *condor* (20 pesos), *doubloon* (10 pesos), and *escudo* (5 pesos). Silver is subsidiary, all at .835 (French) fineness; the peso of 257.72 grains pure metal is equivalent to 69.4 cents, an anomalous coin; divisional pieces are 20, 10, and 5 centavos. Minor coins of nickel are 2, 1, and $\frac{1}{2}$ centavos. Depreciated paper continues the actual standard.

Uruguay: *peso* = 100 *centesimos*; has the gold standard. The peso has 24 grains of pure gold, value \$1.034, coined at .917 fine; subsidiary silver is identical with that of Argentina, the French system, but with .900 fineness for all. Minor coins are of nickel. Paper money is issued by banks.

Paraguay: *Peso* of 8 *reals*, the old Spanish system; modified also by divisions of the peso into 100 centavos. Depreciated paper issued by the government is the standard. No gold or silver coins of its own; nickel pieces of 20, 10, and 5 centavos and foreign coins of larger value, constitute the circulation beside the paper, which latter is rated at 11 $\frac{1}{2}$ cents gold to the peso.

Brazil: *Milreis* = 1,000 *reis*; gold standard system modified from Portuguese; unit, about $\frac{1}{3}$ that of the latter country, contains 12.69 grains pure gold, value 54.6 cents; 20, 10, and 5 milreis pieces are coined, nominally at British fineness, actually at .917. Subsidiary silver 2, 1, and $\frac{1}{2}$ milreis, the milreis having 180.43 grains pure silver, equivalent to 48.6 cents, also .917 fine. Minor coins 1-5, 1-10, and 1-20 milreis of nickel; 40, 20, and 10 reis copper, the latter nominally .0054 cents, so that the theoretic reis is .00054 cent. Depreciated paper issued by the government forms the monetary basis, gradually moving up to par; gold premium about 80.

MAURICE L. MURKMAN,

Late Deputy Assistant United States Treasurer.

Monetite, a native acid phosphate of calcium, CaHPO₄, occurring massive and in small, triclinic crystals, in the islands of Moneta and Mona, in the West Indies. The mineral is found in limestone, beneath a deposit of guano. (Also spelled 'monitite'.)

Money, Walter, English author: b. Donnington, Berkshire, 21 Aug. 1836. He received his education in a private school and early began to study on historical and archeological subjects, and for a number of years was the local secretary of the Berkshire Society of Antiquarians, London, and of the British Archeological Association. From 1880-97 he was a member of the Berkshire County Council. Among his publications are: 'The History of Hungerford'; 'The History of Speen—the Roman Spina'; 'Church Goods in Berkshire'; 'The Two Battles of Newbury, 1643-4'; 'The Story of the Siege of Donnington Castle'; 'The Siege of Basing'; 'A Royal Purveyance in the Elizabethan Age'; 'A Popular History of Newbury and the Neighborhood' (1905).

Money, the term used to designate the medium of exchange, the standard or measure of value; in ordinary use, however, it is applied only to coin and paper currency.

Barter.—The primary trading of mankind was simply the exchange of one object for another, termed *barter*. In the course of the development of the race, the increasing interchange of commodities between individuals and tribes made it evident at a very remote period that even the crude form of commerce then existing would be greatly facilitated by the use of some one commodity as a general medium. The difficulties encountered in the process of mere bartering, even in the age when man's wants as well as his products were few, can be appreciated only if we can imagine conditions under which, for example, a producer of wheat desiring shoes, was compelled to find a shoemaker who at the same time needed wheat and would part with the shoes in exchange therefor. If the latter's need for food-stuff were fully supplied, he would not care to exchange the leather and labor represented by the shoes for grain; but he might be in need of a hammer and nails and the owner of the wheat would be compelled to find a blacksmith desiring wheat, from whom to obtain that which would procure him the shoes. It is quite conceivable that the purchase of a pair of shoes then cost more time and trouble than their manufacture; but when the farmer could exchange his wheat for something which the shoemaker in turn could use to procure a hammer and nails or almost anything else he needed, the trade was easily consummated. Again, if the question arose, How many nails will equal the cost of a pair of shoes? the answer might be difficult; whereas when a definite quantity of nails is to be had for a certain quantity of money which in turn is the cost of the shoes, the measuring is speedily accomplished. What may be termed the *lesser trade* (retail) of the world consists of an almost unlimited number of such transactions which are now so readily adjusted by means of money, that its importance as a medium is rarely thought of. Yet there is probably no device that mankind has made use of which has served more effectively to promote civilization.

Early History.—A multitude of articles and substances have been utilized for the purpose of money, the selections depending in each case upon the attending circumstances: in the nomadic state skins of animals, in the agricultural the animals themselves (domesticated); proximity to the seashore furnished the opportunity to use shells, usually those of a superior quality; staple products of the soil, such as grain, beans, tobacco, etc., proved acceptable at times; later almost all of the metals known to the ancients came into use, practically in the order of their value to-day, the less valuable first. Indeed the evolution was steadily toward the commodity which would serve the purpose best, each of the others being rejected in turn as experience disclosed its defects. This progressive improvement took place in each community as its civilization advanced; hence some were ahead of others and profited thereby. The use of articles generally condemned as unfit still continues among peoples only partially civilized; thus lead is still used in Burma, cowrie shells to this day form a part of the money supply of Siam and countries round about, and beads are current money in many parts of Africa and Oceania. We find that in communities well advanced in civilization the paucity of precious metals and other circumstances compelled the

use of other articles; thus in the successive frontier settlements in the United States skins of beaver and other fur-bearing animals were generally given monetary functions, and it will be recalled that the early colonists employed the wampum (shells) of the Indians in the North and tobacco in the South. It was requisite that the object selected to serve as money possess value, immediate or potential, for ordinary uses, for purposes of ornamentation or for the gratification of other desires; since no one would, generally speaking, part with his property or his labor for something having no value direct or indirect, objects lacking this quality could not for any extended period prove acceptable.

Gold and Silver—The selection of the precious metals (gold and silver) which in the course of the evolution became so general, was preceded by their use for ornamentation which made them almost universally desirable, giving them a special value. This value has been substantially increased by their use in the arts; but their use as money unquestionably has added much more; for it must not be lost sight of that gold and silver are commodities the value of which is subject to the same law of demand and supply which controls that of other commodities; the monetary use of the metals now constitutes the chief demand. The ultimate selection of these metals for the principal monetary purposes was due entirely to their special adaptability, hence to the operation of natural law. In addition to their being desirable, they possess the following qualities now demonstrated to be requisite to a just and equitable medium of exchange, and without most of which no substance could serve as an honest measure of value: relative scarcity compared with iron, lead, copper, etc., to which are due their greater value and the relatively greater stability of their value; portability, containing as they do large values in small bulk; durability, since they are not subject to corrosion or other ordinary decay, hence practically indestructible; homogeneity or uniformity, since unlike other commodities the quality of these metals (when duly separated) is practically identical no matter where they are found; divisibility, rendering them capable of being divided into small parts and again united without appreciable loss. Manifestly a commodity frequently varying in value (wheat for example) would not serve as a just measure any more than would a yard stick that grew shorter or longer; a destructible commodity might cause the seller to be deprived of a part or the whole of the value which he expected to possess when he parted with his goods; bulkiness and indivisibility would seriously hamper exchanges, furthermore if too plentifully and easily produced the metals would be worth less and be subject to too much fluctuation.

Early Coinage—The historical evidences of the early uses of gold and silver are not such that a fixed date can be referred to; it is, however, certain that silver was in general use before gold, and that both were employed as early as 1800 B.C., which indicates that the intelligence of certain nations, born of their experience, had caused them to seek for something possessing some or all of the attributes above named for several centuries anterior to that date. During all of this period and certainly until 900 B.C. the metals passed by weight, in bars and ingots or in crude form (dust, etc.); the shekel,

the talent, the as, of the ancients were weights just as the tael of China is to-day; and the names of certain coins are, or were, names of weights, viz., drachma, mark, pound, livre, lire, peso, peseta. The use of the metals as money by weight for the greater portion of the trading at that time proved a cumbersome process, involving as it did continuous reference to scales; and doubtless the defects in the means of weighing and of determining the purity of the metals, brought about over-reaching and innumerable disputes. It was therefore a most important advance when by the introduction of the device of coining both the weight and the purity of the metals were certified by a more or less authoritative stamp. History accords the credit of this improvement to the early Greeks, and fixes the date at about 900 B.C. As in the course of time other nations adopted the same method, and the authority to coin money was by common consent given to the rulers, the people regarded themselves protected against fraudulent impositions of base metals and false weights, and exchanged their products freely for this convenient form of money. It must be continuously borne in mind that the great mass of people, even in the present enlightened age, know comparatively little of the character and functions of money; and in the early ages they necessarily depended in a much greater degree upon certain marks to identify the coins, after learning by experience that certain pieces would, and others would not, procure for them what they required; and since the chief end in view was the facilitation of the exchanges in every way possible, the enormous advantage of a system of coined money becomes apparent. Moreover coin served more effectively for the measuring of values; definiteness, precision and prompt action became possible; while in the periods when other articles were used and in a less degree only when the metals were employed by weight, these elements were lacking, and measuring values was continuously attended by obstacles. The general adoption of silver, and later gold as well, for money coinage did not prevent the extensive use of copper and other metals for the same purpose; but important as the functions of these base-metal coins were for long periods, they need only be discussed as "token money" to which they were ultimately reduced by all nations.

False Money—The coining power has universally been recognized as a prerogative of the government, no matter what the form of the latter; unscrupulous monarchs took advantage of the ignorance of the people to debase the "coins of the realm," causing them to be made of less metal than the stamp indicated; this method of defrauding the people was also imitated by shrewd individuals who reduced the value of the pieces by "sweating" (removing part of the coin by chemical or artificial means), and by clipping off a portion; beside these practices the natural abrasion (from wear and tear in use), when coins were circulated for too long periods, also served at various times to render the money of some countries the means of cheating the ignorant and unwary. These base coins were usually detected only when they reached the few intelligent persons, who refused to receive them at their stamped valuation; but even thereafter the pieces circulated quite freely because of the imperative need of the people for some form of counters with which to make

MONEY

their daily exchanges. When the cheating became unbearable, the people rebelled and corrective measures were adopted or a new ruler was substituted. In many instances the ruler's fraud was followed by an edict that the base coins must be received by the people at the valuation expressed thereon, which edicts were practically the first "legal tender laws," of which more hereafter. Honest errors of judgment also caused similar results; thus in 1792 our mint law fixed the ratio of silver to gold at 15 to 1, when the actual ratio was seriously fluctuating; the disturbance caused continued until the change in 1834 when the ratio of 16 to 1, also erroneous but in a less degree, was adopted. These attempts to arbitrarily interfere with the operation of the natural laws of money and exchanges served only temporarily, since the prices of commodities soon adjusted themselves to the new standards thus created. In other words, an article selling usually at a shilling would, when the shilling was reduced to one half its former weight in silver, cost two shillings; the shilling in effect became only a half shilling. As the trade between nations developed this also served to correct many of these evils; for obviously the force of the legal tender laws did not extend beyond the borders of one country; and not only was the mercantile class sufficiently intelligent to detect base or reduced coins, but those in the international trade refused to recognize the stamp as conclusive evidence of the value of the coins, accepting them only by weight and fineness (purity of the metal); indeed international transactions in the metals are to this day effected by weight and not by tale or number of pieces. Hence, it may be observed here, bullion (uncoined metal) is generally preferred to coin for international settlements. The point to be specially noted, is, that the natural economic laws prevailed in the long run, despite royal edicts and laws of parliaments, which endeavored to establish fictitious values and unjust money and measures. During one of the periods when England was suffering from the wretched state of its coins (about 1559), a study of the conditions led to the discovery of what is known as Gresham's law, that good money will be displaced by bad in a community where the bad money may be used to discharge obligations. Manifestly if one species of coins contained greater value than another, both having equal debt-paying power, the inferior would be parted with first and put into circulation. In obligations payable outside the country the superior pieces would be employed, thus leading to their exportation. For example, the grain of gold has a value, practically fixed, throughout the civilized world; a coin which the law decrees shall contain 100 grains, may circulate at home even when reduced to 99; the full weight piece alone, will bring full value abroad.

Credit—The use of the precious metals and especially after the introduction of coinage, developed further functions of money, namely, its service as a *store of values* and as a *standard for deferred payments*; every individual having a surplus of products beyond his needs was able, by exchanging it for coin, to lay away the latter for future needs, conscious of the fact that such action in no wise depreciated his wealth; and moreover he could dispose of his commodities for a promise to pay such coin in the future knowing that ultimately the value would come to

him if his debtor met his obligations. The latter form of transactions was possible only after a community had reached a stage of civilization when *credit* became a factor; when men trusted each other to a measurable degree, when leases, promissory notes, and other forms of contracts came into vogue. The great importance of the requisite of *stability* of the medium of exchange can be better appreciated when considered in connection with these two functions; a form of money which might in several months, or a year, lose a substantial part of its value would defraud him who was to receive it or who held it for future use; conversely if the money appreciated the debtor would be mulcted by being compelled to give greater value than he actually contracted to give. These principles were not learned at once even by the most intelligent; it was necessary that mankind pass through many periods of oppression and distress before they became patent; the people were ultimately brought to demanding not only that their rulers act honestly respecting money, but that tampering with it by individuals be punished most severely; even our own first mint act (of 1792) provided the punishment of death for debasing the coinage on the part of mint officers.

Ratio.—When the two precious metals came into joint use, the fact that gold was, owing to its greater scarcity, superior qualities, and beauty, esteemed more highly than silver, made it necessary to recognize it as of greater value in money form; this value relation is known as the *ratio*. For many centuries silver and gold were thus used jointly by the civilized world, both having full debt-paying power when coined; more silver being universally required to constitute a given coin value than if the coin was of gold; and although the process was slow, the value of silver gradually fell, a larger supply relative to the demand (and compared with gold) having been made available by the products of the mines. Thus, the ratio which at the beginning of the Christian era was about 9 to 1, had fallen by 1500, to 11 to 1; in 1600 about 12 to 1 is recorded; in 1700 it was 15 to 1; in 1800 15.4 to 1; in 1870 15.6 to 1; moreover the fluctuations in the intervals had been very considerable; and since the world's intelligence was continually seeking for greater stability, a definite movement for the demonetization of the white metal began soon after the last mentioned year. This involved not only the sale of old silver coins but diminished the demand for silver for new coinages, and necessarily accelerated the fall in its market value; with the result that the ratio at the beginning of the 20th century, when practically all civilized nations had adopted the single gold standard, stood at 32 to 1. But it was only as full-debt-paying money that silver was demonetized, in fact, more silver is in actual monetary use than ever before, but in a subordinate capacity, as subsidiary coin, for the smaller payments of retail trade and for fractional sums.

Subsidiary and Token Money.—Subsidiary coin is designed for domestic use only, each nation having its own. By making the pieces of less relative value than the chief coins, they were rarely exported; whereas formerly the people were deprived of their "small change" whenever an extraordinary demand for silver arose. Thus in the United States in 1845-52, there was such a dearth of fractional

MONEY

pieces that the people were compelled to use tickets, stamps, etc., until by the law of 1853 the coinage of pieces of less weight was ordered. (Two half-dollars weigh about 7 per cent less than the silver dollar.) Subsidiary coin has only a limited legal tender power; indeed it may be said that it is a higher species of token money, by which is meant a form possessing little or no value, and used merely in the capacity of counters, but indispensable for the smallest transactions. The ordinary token money is to-day made of nickel and of bronze (a composition of copper, tin and zinc).

Quantity of Money.—The quantity of money available is an important factor in the maintenance of stability of values; a surplus causes a rise, and a dearth brings about a fall, of prices. The interest or discount rate is the index of the supply, and is regarded as the price of money. But the quantity which any given community requires can not be determined with anything like definiteness. If natural laws alone operated, the movement in prices would in large measure correct a temporary local dearth; for prices ordinarily indicate the measure of the demand for money, and it will like other commodities flow to the locality where it commands the best return. A general dearth, however, brings about distress, paralyzing exchanges and checking enterprises; a general plethora has the contrary effect, and unless corrected causes overspeculation and its attendant evils. Statistics of the world's metallic money supply are not available for the earlier periods; but existing estimates of the European stock give for about the beginning of the Christian era \$1,800,000,000; for 500 A.D. less than \$500,000,000; for 800 A.D. less than \$200,000,000. To this enormous decrease is attributed the backward trend of civilization during the Dark Ages, a tendency not counteracted until after the discovery of America (1492) and its vast stores of silver and gold; by 1600 the stock available is estimated at \$650,000,000; by 1700 it had reached \$1,500,000,000; early in the 19th century the \$2,000,000,000 was reached; and at the opening of the present century the stock of gold and silver in the world was approximately \$3,500,000,000. Of the annual product of gold, now about \$300,000,000, about 70 per cent is added to the money supply.

Credit Money.—Notwithstanding the portability of the precious metals it was in time found practicable to save the trouble, risk and cost of transfers of coin and bullion, by the introduction of paper representatives of the metals. The earliest form of these now so generally acceptable devices was merely a receipt given by the gold- and silver-smiths and others who made the handling of the metals a special business. Obviously this was possible in any important degree only after credit had become a factor in trading. Indeed, the earliest instance in the history of the Western World of the use of a substitute for coin was the practice of merchants, begun in Italy some six centuries ago, of depositing their specie with one of their number, each receiving a credit upon his books and making payments by transferring such credits to others; a crude form of banking said to have arisen because of the great diversity and variation in value of the coins issued by the numerous small principalities then existing. (It is a well established historical fact that in China

the use of these and much more advanced forms of paper money were in use some centuries earlier). The paper receipts and book credits were in time followed by orders to pay the specie deposited, which were acceptable wherever the parties to the transaction were known; the use of such orders became quite general among merchants, and as credit became more general they were also employed in international transactions, in the last mentioned use they were called bills of exchange.

Bank-checks and Bank-notes.—Another form of transfer of credit is the bank-check, which is an order upon the bank where money has been previously deposited or a credit established otherwise, to pay money in discharge of a purchase or obligation. These several devices save not only the transfer of the coined money, but practically increase the amount available; fully 97 per cent of the enormous volume of the international commerce, and 92 per cent of the equally large domestic trade transactions in the United States, are adjusted by means of bills of exchange, drafts and checks, thus avoiding the necessity of sending coin to and fro, and enabling its utilization for other purposes. The process of banking has added further to this economization of coin; for the bank-checks, while not circulating extensively, nevertheless very frequently pass from hand to hand and only a small portion of the great mass is ever presented to be paid in money, the rest being deposited to establish fresh credits in the banks; and the banker is enabled to use a substantial part of the cash held by him to give further credits. The institution (about 50 years ago) of clearing-houses, where the banks exchange these deposited checks daily, further reduced the amount of money actually handled. While these instruments are not ordinarily termed money, it will be observed that, since they perform a most important part of the service of a medium of exchange, the designation of *credit money*, applied to them in the recent past, is entirely appropriate. A form of paper which is more generally regarded as actual money, known as the *bank-note*, was an evolution from the preceding forms. It is merely the promise of the bank, authenticated by its officers, to pay a fixed sum of money on demand, and in its earliest form represented coin actually held in bank to redeem it. The Bank of Sweden is credited with having first (1658) issued this form of paper money. Originally written, the notes were ultimately in printed form, for round sums and small denominations. The great convenience of bank-notes for general use by the more intelligent in the community, soon made it evident that only few out of a given number were presented within a given time; the banker thus found it practicable, when his credit was well established, to issue more notes than the sum of coin in bank available for their redemption; and further experience demonstrated the practicability of issuing two, three, and even four for one, under ordinary conditions; while it is not actually fixed what proportion of coin should be held in reserve, this depending not a little upon local customs, the margin may be stated at from 25 to 40 per cent. Here we have manifestly another means of increasing the potentiality of coined money to a community. As the mass of the people gradually learned that bank-notes were a safe and useful medium, the number of

MONEY

banks increased and provided notes for the several communities.—The conclusion that bank currency is a most valuable adjunct to coined money, rests upon solid premises; the supply of the precious metals alone could not have served the civilized world adequately in the development of trade and industries, which history records as the work of mankind in the last three centuries; even to-day the enormous supply is insufficient to meet the demand. Upon the other hand, the history of such currency, particularly in the United States, demonstrates that without the most carefully devised safeguards, it may, and usually will, become a curse to the people. Having in mind the indispensable requisites of a medium of exchange as heretofore set forth, it is obvious that bank-notes possess such requisites only when their credit is fully assured; in short, when the coined money can be secured if and when demanded. If this credit is lost, depreciation follows; the depreciated paper brings about results similar to those caused by debased coin, and is worse since, having not even a fraction of intrinsic value, it causes, when entirely discredited, complete loss to the holder; at best it has only a fluctuating value in exchange, and hence can easily be used as an instrument to defraud. In like manner, also, as in the case of debased coin, it drives out the better money. The community must therefore protect itself by law against such evils. Excessive issues of bank-notes, by inordinately expanding the amount of the available medium, are also followed by a measure of discredit, and frequently cause all the evils of depreciated paper. It is hence a requisite of a properly adjusted bank currency that the volume shall be regulated by general provisions of law, so that, while supplying the natural need arising from the inadequacy of the metallic medium, it shall not be inflated beyond such needs and thus cause a disturbance in prices, speculation, and an expulsion of part of the coined money. We have in our own history an example of how an ill-regulated currency operates. The people of the United States during a greater part of the period from 1790 to 1865, with some notable local exceptions, had imposed upon them a bank currency which literally defrauded them continuously, because of the absence of those safeguards which the laws should have provided. The paper circulation included notes of mythical banks, notes of banks which never pretended to have coin in reserve, notes of defaulted banks, and of such as had deliberately repudiated their issues; excessive issues were common occurrences; counterfeits abounded, and at times even the pretense of a bank was absent, individuals printing notes for circulation. This mass of paper was not money; the pieces merely served the purpose of counters, so long as the people, in the absence of anything else, were compelled to use them. When the nationalizing influence of the Civil War period prevailed, the people turned from the farcical bank-note system to one which provided for notes secured by bonds, which are absolutely safe but not bank-notes; for the so-called national bank-notes are based upon the credit of the national government.

Government Notes.—This brings us to the consideration of the last of the forms of paper money, the *government note*, which is a promise to pay coin on demand. Except when

in the form of certificates for coin actually held, these notes are dependent upon the revenues and the credit of the government. So far the world's experience with this class of paper money has been invariably disastrous. The beginning of the issues has always been due to extraordinary needs of the government, as in case of war, when the duty of raising revenue by taxation or straightforward borrowing was evaded; and since the exigencies were usually severe, the promises to pay coin were usually broken. Not only did the ensuing discredit cause depreciation, but by the increase of the volume, which always followed, the fall in values was accelerated. Thus, in our colonial period, notes issued by colonial authorities depreciated so that at one time £1,100 of paper was required to obtain £100 coin; in the Revolutionary period continental currency fell to a point where the rate was 1,000 to 1; and during the Civil War our "greenbacks" at one time were worth less than 40 per cent of the face. These notes all served as a medium, but a fluctuating, hence dishonest, one, by means of which the shrewd few were enabled to accumulate inordinate wealth at the expense of the mass of the people. It is patent that individuals hesitated to accept such a medium, non-convertible into coin; and hence legal tender laws were enacted to compel the acceptance. Such notes are generally known as "flat money," the dictum of law alone giving them currency. Tested by the requisites for an honest medium of exchange, measure of values and standard for deferred payments, government notes, even the best that the ingenuity of man has been able to devise, fail to respond to the requirements. They usually depreciate, and since restoration to equality with specie is expensive, it is generally delayed, rendering the medium unstable for extended periods; equally expensive is the maintenance of a coin reserve, not dependent upon any natural sources of replenishment as in the case of a bank's reserve; the volume of notes, instead of being responsive to the needs of trade, is dependent upon legislative (frequently partisan political) exigencies; such a system must be reinforced by legal tender laws which interfere with the freedom of trade, compelling the acceptance of something which would often preferably be refused. It is not inconceivable that a government note system might be evolved which would fully serve the purposes in view; but it is certain that thus far the bank-note system, adequately safeguarded, affords the only form of paper money that fully answers the requirements. While the best examples of such a system which have stood the test of generations, are not identical in form, the general principles upon which such a system should be based are recognized in each. These principles may be generally stated as follows: (a) paper money should be used merely as an auxiliary to coin, to save the cost of using coin and to supply deficiency in the stock of coin; (b) its volume should be severely limited so as never to be in excess of the bank's ability to supply coin on demand; (c) the volume should within those limits contract and expand with the demands of trade; thus the requisites of security, prompt redemption and flexibility of volume are assured. (Our notes based upon bonds possess only the first requisite.) Inasmuch as the demands of trade constitute the reason for the use of paper money, trade considerations only

MONEY

should govern the extent of their use. To insist, for example, upon a certain amount of money per capita, is obviously unreasonable; no such arbitrary rule of measure is, in the nature of things, applicable. For example, in France, where the people use checks only sparingly, a per capita of nearly \$40 appears necessary; in Great Britain, where the check system has reached its highest development, less than half that amount suffices; with us, where checks are used, but not in so great a measure as with the British, an amount between \$25 and \$30 per capita is still required. At certain seasons, as when crops are moved, a larger supply is necessary; when the period has passed, the continued existence of the added volume disturbs the price equilibrium, hence it should be withdrawn. A crude, and by no means complete, illustration of the operation is afforded by the transactions of a cotton factor who has advanced to the planter capital to gather his crops, and receives the cotton in payment. He proceeds to ship the textile to Liverpool, drawing his draft payable in, say, three months for the proceeds of the sale; this draft, with the ship's bill of lading attached, he takes to the bank for discount and obtains the bank's notes, with which (his replenished capital) he enters upon a new transaction. When the bank has received the amount of the draft on Liverpool it has its cash again in bank, and unless a new transaction presents itself, it should use this cash to redeem its notes and cancel them as they are presented or deposited with it. Thus the volume of its notes is regulated by the demand.

Statistics.—The statistics of note issues are of interest. Generally the information is confined to "uncovered paper," a term used to designate notes issued in excess of coin; sufficient is known to indicate that the volume of notes at present in use in the world is approximately \$6,000,000,000, one half of which is "covered." For 1890 the amount of uncovered paper is given as \$4,230,000,000, indicating a substantial increase in coin reserves made possible by the marked increase in the gold product since the latter date. To show how the currency of the principal countries was affected by this increase, it may be cited that while there were in use in 1873, \$2,322,000,000 of uncovered notes, the figures for 1902, when the gross issue was greater, aggregated only \$1,270,000,000. Adding to the large amounts thus reported the available bank-credit-money (capital and deposits of banks), which constitutes the fund against which checks and drafts are drawn and from which loans may be granted, it is found that the world had, in 1890, approximately \$16,000,000,000 of both credit-money and bank-notes available; in 1902 the sum was stated to be \$27,000,000,000.

Conclusion.—We have seen how in the evolution of civilization the need for a standard finally led to the adoption of that article which proved most serviceable for the purpose—gold; we have also seen that mankind was, in the long run, always impelled by the desire to reach, as nearly as was possible, a medium and standard that would prove honest and equitable; that in the choice of an auxiliary this rule of action has likewise governed. It is not impossible that both gold and bank-notes may in the course of the present century be superseded by other articles or devices better

calculated to serve all the needs. A number of propositions looking to such an improvement have been presented and discussed, but none have thus far received the general approval of even the theorists. It is certain that any plan to supersede the existing forms of money must be demonstrated practicable beyond question, long before custom and habit of the people can be changed; for they, more than ever before in the world's history, appreciate the importance to their welfare of honest money, and the oppression, robbery, distress and desolation which dishonest money carries in its train.

Late Deputy Assistant United States Treasurer.

Money, Coin. See COINAGE; NUMISMATICS.

Money, Paper, a money issue of a nation or government; a stamped sheet of paper, silk, linen, or parchment, given an official value and used as a medium of exchange. Although coins were used before paper money, the latter was known among the ancients. Corn, cattle, iron, leather, cocoa, shells, tobacco, and other commodities were all, in point of fact, used as money, in different ages and different countries; but they have long ceased to be so used, by commercial nations, for reasons similar to those which have induced men to choose for their standard of length some object less liable to variation than the foot of a chancellor, or the fore-arm of a king. The high estimation in which the precious metals have been held, in nearly all ages and all regions, is evidence that they must possess something more than merely ideal value. It is not from the mere vagaries of fancy that they are equally prized by the Laplander and the Siamese. It was not from compliance with any preconceived theories of philosophers or statesmen, that they were for many thousand years, in all commercial countries, the exclusive circulating medium. Men chose gold and silver for the material for money for reasons similar to those which induced them to choose wool, flax, silk, and cotton for materials for clothing; and stone, brick, and timber for materials for building. The scarcity of gold and silver, the need of bills of exchange, and the want of a money more convenient for the individual to carry, and lastly, the issuance of government credits forced on bankrupt nations, brought about the use of paper money in European countries, and Colonial America early adopted this medium of exchange from the English.

Provincial Paper Money.—In the earliest days of America, paper money was first issued by Massachusetts in 1690. The object was not

AMERICAN COLONIAL PAPER MONEY.

1. New York Province Half-dollar. 1775.
2. Connecticut Colony 5 shillings. 1776.
3. U. S. Continental Currency, \$3 1775.
4. Vermont State Currency, 1 shilling. 1781.
5. New Jersey State Currency, 1 s. 6 pence. 1781.
6. North Carolina Currency, \$6. 1776.

MONEY

to supply any supposed want of a medium for trade, but to satisfy the demands of some clamorous soldiers. Other issues were subsequently made, partly with a view of defraying the expenses of government, and partly with a view of making money plenty in every man's pocket. The ill-judged expedition of the Carolinas against Saint Augustine, in 1702, entailed a debt of 6,000 pounds on that colony, for the discharge of which a bill was passed by the Provincial Assembly for stamping bills of credit, which were to be sunk in three years by a duty laid upon liquors, skins, and furs. For five or six years after the emission, the paper passed in the country at the same value and rate as the sterling money of England. To defray the expenses of an expedition against the Tuscaroras, and to accommodate domestic trade, the legislature of South Carolina established a public bank in 1712, and issued 48,000 pounds in bills of credit, called bank-bills, to be lent out on interest on landed and personal security, and to be sunk gradually at the rate of 4,000 pounds a year. Soon after the emission of these bank-bills, the rate of exchange and the price of produce rose, advancing in the first year to 150, and in the second to 200 per cent. By the year 1731 the rate of exchange rose to 700, at which it continued with little variation upward of 40 years. In the year 1723 the province of Pennsylvania made its first experiment of a paper currency. It issued, in March, 15,000 pounds, on such terms as appeared likely to be effectual to keep up the credit of the bills. It made no loans but on land security, or plate deposited in the loan office; obliged the borrowers to pay 5 per cent for the sums they took up; made its bills a tender in all payments, on pain of confiscating the debt, or forfeiting the commodity; imposed sufficient penalties on all persons who presumed to make any bargain or sale on cheaper terms in case of being paid in gold or silver; and provided for the gradual reduction of the bills, by enacting that one eighth of the principal, as well as the whole interest, should be annually paid. These early specimens of provincial paper money were large notes, printed from copper-plates, having engraved borders on three sides. The inscriptions on the bills were in type, with arms or motto engraved in the left side centre. The signatures of the province officials were always signed in red ink.

Continental Money.—The first issue of paper money under the authority of the Continental Congress was dated 10 May 1775, but the notes were not actually placed in circulation until the August following. On 31 May 1781, the continental bills ceased to circulate as money, but they were afterward bought on speculation at various prices, from 400 for one, up to 1,000 for one. The value of continental paper was not the same in different parts of the country. The exchange was, for example, at 35 for one in New England, New York, the Carolinas, and Georgia, and at 40 for one in Pennsylvania, New Jersey, Delaware, Maryland, and Virginia. An account taken from the books of merchants in Virginia shows that the depreciation there regularly followed that in Philadelphia, though, toward the close, it sometimes lagged a month or more behind. Thus when exchange was in Philadelphia at 200 for one, in January 1781,

it was in Virginia at 75 for one. As late as May 1781, speculations were entered into at Philadelphia, to purchase continental money at 225 for one, and sell it at Boston at 75 for one. It is worthy of remark that the depreciation of continental money never stopped the circulation of it. As long as it retained any value at all it passed quick enough; and would purchase hard money or anything else, as readily as ever, when the exchange was 200 for one, and when every hope, or even idea of its being ultimately redeemed at nominal value had entirely vanished. The facility of raising ways and means, in the early part of the Revolutionary War, by issues of paper, led to much extravagance in the commissary department, and prevented the establishment of a sound system of finance. It is said that when a proposition was before Congress to establish a regular revenue system, one member exclaimed, "Do you think, gentlemen, that I will consent to load my constituents with taxes, when we can send to our printer and get a wagon load of money, one quire of which will pay for the whole?"

Connecticut.—Under date of 4 March 1766, Connecticut issued a series of colonial notes of the following values: 9 pence, 1 shilling, 2 shillings and 6 pence, and 10, 20, 30, and 40 shillings. There were 19 regular issues, the last being dated 1 July 1780. There were also three single bills in the nature of treasury notes, the last dated 26 Jan. 1791. Over 100 different bills were issued by this colony. The smaller values were for 2, 3, 4, 5, and 7 pence, issued 11 Oct. 1777. In Connecticut the 6 shilling bill was not infrequently raised by clever counterfeiters to the value of 10 shillings.

Delaware.—In this colony paper money was issued as early as 1735. One value only of these notes has been preserved to us, although doubtless many others were in circulation; the denomination is 10 shillings. The designs of the early issues are all about the same, a type body with a border of the same and wood cut of the royal arms. On 26 Feb. 1746, a new series was issued of the same general design, but noteworthy from having been printed by the celebrated Benj. Franklin and his partner D. Hall. On bills of this colony we first get the information that "To Counterfeit is Death," which is repeated in every possible form, "Tis death to counterfeit," "To counterfeit is death," "It's death to counterfeit this bill," "Death to counterfeiters," etc. The 2 shilling 6 pence bill of January 1776 issue is adorned with pillars, and probably to show that the edifice supported can stand any sort of usage, one is placed upside down. The last series issued, May 1777, contains bills from 3 pence to 20 shillings, and changed the cut of the royal arms for that of the State. Sixty bills emitted by this colony are known.

Georgia.—The earliest bill printed in Georgia was of the value of 2 shillings 6 pence, and was dated 7 March 1740. The Georgia bills were printed on one side of white paper and were usually made attractive by copper-plate vignettes printed in various colors. The vignettes represented figures of liberty, soldier, deer, bog, rattlesnake, palmetto tree, etc. The last issue was dated 16 Oct. 1786. There are over 110 varieties from 3 pence to 5 pounds.

Maryland.—The first bill of this colony is dated 1740 and of the value of one shilling.

MONEY

This was followed by a series of five values in 1748 and from then a regular succession of issues until their final extinction in 1781. The design of the early issues may be described as the arms of Lord Baltimore supported by two men in the costume of the day, one with a fish and the other with a spade. This is differently placed on the various bills. The lettering or form of contract is in the following words, "This indented Bill of Eight Dollars shall entitle the bearer to receive Bills of Exchange payable in London, at the Rate of Four Shillings and Six Pence Sterling per Dollar for the said Bill, according to Directions of an Act of Assembly of Maryland, Dated in Annapolis, this 1st day of January, Anno Domini 1767," followed, of course, by two signatures. The quaint idea of scalloping the end of a legal document to show that it has been prepared with due care and thought, and not cut off in a hurry, is carried out on these bills. In some values even the word "indented" is printed in a wavy line, and that there should be no mistake as to what is meant by a dollar, a minute representation of a Spanish dollar is inserted in the text. The values of the Maryland bills were 3, 4, 6 and 9 pence, and so on up to 3 pounds. There were over 100 varieties issued.

Massachusetts.—Prior to 1775, some 13 examples of paper money were issued in this colony. One of these is a copper-plate engraving said to have been the work of the noted patriot, Paul Revere, of Boston. The series was issued by order of the General Assembly of the Colony of Massachusetts Bay, 7 Dec. 1775. The reverse of these bills bears the figure of a man in continental dress, with a drawn sword in one hand and a copy of the Magna Charta in the other, above "Issued in defence of American Liberty," below in Latin, "He seeks by the sword calm repose under Freedom." The series of 16 Oct. 1776, repudiates the title of Colony for that of State. Coin must have become scarce, as more than half of the denominations are under 1 shilling. The codfish was the principal design on these bills. The next issue of eight values was of interest-bearing notes which are guaranteed by the United States. Upward of 135 bills were issued by Massachusetts.

New Hampshire.—The design of the New Hampshire bills was usually the British arms with inscriptions in elaborate frames. The earlier issues were type-set. About 60 varieties are known.

New Jersey.—The issues in this colony began in March 1724 and continued regularly to May 1786. In shape the bills were a small, narrow oblong. The high value notes were printed in blue and red. In 1781, the royal arms became the arms of the State, the type reading as follows: "State of New Jersey, Five Shillings. This bill shall pass for Five Shillings agreeably to an Act of the Legislature of this State, passed the ninth day of January, One Thousand Seven Hundred and Eighty-one." An entire collection of New Jersey bills would number 185.

New York.—The first bill issued was in 1709, and then followed a series of four dated 18 Dec. 1737. In the next issue the form reads "By a Law of the Colony of New York this Bill Shall Pass current for Three Pounds New

York the 20th April 1756." A set of United States guaranteed notes appeared 15 June 1780.

North Carolina.—The earliest notes were dated 1748, and upward of 120 varieties were printed up to 1780. The most of the North Carolina bills bore motto inscriptions, such as "Virtuous Councils the Cement of States"; "A Righteous Cause the Protection of Providence"; "A Lesson to arbitrary Kings and wicked Ministers"; "Liberty and Peace the Reward of Virtuous Resistance"; "Persecution the Ruin of Empires"; "Union of Hearts the Strength of Interests"; "American Virtue Triumphant," etc.

Pennsylvania.—The earliest known bill was dated 10 Aug. 1723, and was printed by Benj. Franklin. The general style of the notes is the same as used in Delaware, bearing the royal arms, or in 1756 those of Wm. Penn, with his motto, "Mercy Justice." In 1764 a curious notion was adopted of spelling the name of the colony differently on each bill, thus on the series we find Pennsylvania, Pensylvania, Pennsilvania, and Pensilvania. On some of the notes issued in 1771 is the signature of Francis Hopkinson, and on the bills of April of the following year that of John Morton, both signers of the Declaration of Independence. In 1777 the shape of the bill changes to the oblong form, and the arms of Pennsylvania take the place formerly devoted to those of Great Britain. This series are found both in black, and red with black type. In 1780 a set guaranteed by the United States, of the same design as issued for other States, was put in circulation, and on 16 March 1785, the last of the series saw the light, the denominations running from 3 pence to £4, 16 values in all. The varieties issued by this colony were over 250.

Rhode Island.—The paper money of Rhode Island was similar in design and value to that of Connecticut. The first issue was in 1715 and the last in 1786. There were about 75 varieties.

South Carolina.—There were various notes issued in this colony from 1712 to 1770. The bills dated 6 March 1776 were supposed to have the value of silver, equivalent in currency is given thus, 6 Spanish milled dollars = £9 15s. currency. In 1779 appeared the handsomest notes heretofore used in the country, the backs of the \$50, \$70 and \$90 bills representing Atlas, Prometheus and Hercules being especially noteworthy. The total number of bills for South Carolina was 105.

Vermont.—In this colony there were but two series, the first issued in February 1781 is an ordinary type-printed note, with engraved border on three sides with the state seal about the centre. This consists of a pair of scales and a chain of fourteen links (the only instance where the number is carried above the original thirteen) enclosed in a circular band inscribed "Vermont Calls For Justice." The second issue are in the form of treasury notes, the amounts being filled in with ink.

Virginia.—The first issue for this State was in 1755. The notes are of two varieties, the first a fine, large bill after the English style, and then something between a draft and a bank-bill, being probably made to fill a pressing want. The bills are copper-plate engravings filled out in ink. On the issue of 1775 are the royal arms of Virginia in an engraved frame. The lettering reads, "Three Pounds Current Money of Virginia Pursuant to Ordinance of Convention"

Passed 17 July 1775. The following year introduces the "sic semper tyrannis" in place of the arms.

Bank Notes.—From the Revolutionary period to the days of the Civil War and to the present time, many issues of paper money have been made by the government, and by national, state and local banks. (See BANKS AND BANKING.)

Confederate Paper Money.—During the Civil War the Southern States in secession issued millions of dollars in paper money, beginning in July 1861, with bills of from \$5 to \$100. On these were designs of the Confederate flag, a train of cars, cotton bales, etc. In September 1861, appeared at least 50 varieties of bills in value from \$5 to \$100. They were of various designs. A \$20 bill showed a head of Alexander H. Stephens in one corner; a \$10 bill pictured General Marion offering a breakfast of sweet potatoes to a British officer. Portraits of Davis, Hunter, Memminger, Stephens, Mrs. Pickens, Mrs. Davis, Benjamin, Gen. Jackson, and others, appeared on the high value notes. There was an issue of \$1 and \$2 bills in 1862 and in April 1863, appeared a series in value from 50 cents to \$100. Some of these bore designs of the capitol buildings at Richmond, Nashville, Montgomery, etc. The last issue of bills from 50 cents in value to \$500 appeared 17 Feb. 1864.

Postal Currency.—The United States government printed a paper money as a substitute for fractional currency during the Civil War, owing to the scarcity of silver. This was invented by General Spinner, United States Treasurer under Lincoln, and was commonly known as "shin-plaster" money. The issue was in small scrip of the denominations of 3, 5, 10, 25 and 50 cents. It disappeared from general circulation about 1870.

Greenbacks, Silver and Gold Certificates.—The more recent issues of American paper money in circulation at the present day are printed at the Bureau of Engraving and Printing at Washington. The engravers are specialists, and the figures and intricate designs of their work are often marvels of artistic skill. Portraits of living persons are never put on the notes, and all the figures, vignettes, borders, etc., are engraved separately before they are put on the plates. First the engraver works out his design, and after transferring it by hand to a plate of soft steel the plate is hardened and a soft steel roller takes the impression from it. After this roll is chilled another impression is taken on another steel plate, and after this latter has been hardened it is ready for use. The geometric lathe which makes the border is a complete and wonderful piece of mechanism. The lines for the borders, backs and other conventional designs seen on the notes are made by this machine. The paper for printing the bank-notes is manufactured under the supervision of government officials. It has two perpendicular lines of short, uneven silk threads running through it.

Foreign Paper Money.—The notes of the Bank of England are 5 by 8 inches in dimensions, and are printed in black ink on Irish linen water-lined paper, plain, white, with ragged edges. The notes of the Bank of France are made of white water-lined paper, printed in

blue and black, with numerous mythological and allegorical pictures. South American currency is about the size and appearance of the American. The German notes are printed in green and black. The Chinese paper money is in red, white and yellow, with gilt lettering and various devices. Italian notes are printed on white paper in pink, blue, and carmine, and ornamented with a vignette of King Humbert.

WILL M. CLEMENS,

Editorial Staff, 'Encyclopedia Americana.'

Mon'eywort, Creeping Charley, Creeping Jenny, or Herb-twopence, are popular names for *Lysimachia nummularia* of the primrose family. The plant, which is a native of Europe, is a perennial with roundish leaves and axillary flowers borne from early summer until autumn. It is very popular for planting in rockeries, vases, hanging-baskets and shady situations, and has become naturalized in the eastern United States. Propagation by seeds or cuttings is very simple, and the plants seem to thrive in any moist, shaded garden soil, cool greenhouse, or window. Several other plants are sometimes called moneywort; for example, *Anagallis tenella*, *Dioscorea nummularia*, and *Thymus chemedrys*. See LOOSESTRAFE.

Mon'fort, Francis Casatt, American Presbyterian clergyman: b. Greensburg, Ind., 1 Sept. 1844, d. 1 Feb. 1906. He was graduated from Wabash College in 1864, studied theology and after entering the ministry held Presbyterian pastorates in Cincinnati, 1869-88. Since 1873 he has been editor of the 'Herald and Presbyter.' He has published 'Sermons for Silent Sabbaths' (1887), 'Socialism and City Evangelization' (1887), 'The Law of Appeals' (1893), 'Ecclesiastical Discipline' (1900).

Monge, Gaspard, gas-pär môngh, French mathematician and physicist: b. Beaune, France, 10 May 1746; d. Paris 18 July 1818. He was educated at Beaune and Lyons and at 16 was a teacher. He made rapid progress and some valuable discoveries in engineering, and in 1783 was called to the professorship of hydrodynamics in the Paris Lyceum. He was a supporter of the French Revolution, became minister of marine and was temporary minister of war and one of the signers of the death warrant for Louis XVI. He resigned soon after the king's death and was engaged in manufacturing arms and gunpowder for the army. He founded the Ecole Polytechnique under the Directory and was professor of mathematics there, but was later sent to Italy to assist in the removal to France of the art treasures captured by French armies, and there gained the friendship of Napoleon whom he accompanied to Egypt in 1798, continuing his scientific researches. He resumed his position in the Ecole Polytechnique upon his return to France and in 1805 was elected senator. Napoleon gave him an estate in Westphalia, and the title of Count of Pelusium, but the downfall of the emperor resulted in reverses for Monge who was expelled from his positions in 1815. He published: 'Traité élémentaire de Statique' (1788); 'Leçons de Géométrie Descriptive' (1795); etc. Consult: Dupin, 'Essai Historique sur les Services et les Travaux Scientifiques de Monge' (1819); Obenrauch, 'Monge der Begründer der darstellenden Geometrie als Wissenschaft' (1893-4).

MONGHYR—MONGOLIA

Monghyr, *môn-gér'*, or **Monghir**, India, the capital of a district in the Bhagalpur division of Bahar, Bengal, on the right bank of the Ganges, 80 miles east of Patna. It communicates by a steam ferry with its railway depot on the opposite bank. It is of great antiquity, and has an elevated fort, enclosing the district administrative offices. Monghyr still enjoys a local reputation for its former important manufactures of swords, firearms and hardware. Pop. (1901) 35,883.

Mongolia, Asia, a vast central and eastern region belonging to the Chinese empire, between lat. 35° and 52° N., and lon. 82° and 123° E., bounded on the north by Asiatic Russia, east by Manchuria, south by China proper, and west by Sumaria and East Turkistan; estimated area, about 1,300,000 square miles.

The central portion, nearly a fourth of the whole, is occupied by the Desert of Gobi, an extensive sandy plateau, with a few spots of pasture and brushwood. Other parts are intersected by lofty granitic chains, the principal of which are the Altai, the Thian-shan, the Khinghan, and the In-shan. The largest rivers are—in the north the Salenga, and in the south the Sira-muren. The climate presents the opposite extremes of intense winter cold and summer heat. Agriculture is but little developed, and that only in the south on the borders of China proper; cattle raising, a few domestic industries, and the transporting of goods are the chief occupations of the inhabitants. There is a considerable transit trade with Russia and China; the principal commercial centres are Kuku-Khoto, Kalgan, Biru-Khoto, Dolon-nur, and Kuku-erghi, in southern and southeastern Mongolia; Kerulen in the northeast, Kobdo, Ulasutai, and Urga in the northwest. The population is estimated at about 3,000,000, divided into tribes chief of which are: (1) the Khalkas, or Mongolians properly so called, who occupy the entire north of Mongolia; (2) the Ouryantai and the Darkhat, who are Mongolized Turks; (3) the Ordos of pure Mongolian blood; (4) the eight tribes of the Tsaktar, of Mongolian blood.

The Khalkas are divided into four "aimaks," or principalities, the creation of which, it is said, dates back to Genghis-Khan. These are Toucheton, Tsetsen, Sain-Noin, and Tsatsatkou. Each aimak is divided into "hoshuns," which are subdivided into "sumuns." Such distribution of the territory is very ancient.

Although the Mongolians are vassals of China they govern themselves. In each administrative subdivision there is elected a chief, whose election is ratified by the Chinese government, and who receives from Peking a title of honor of slight importance, along with a button or peacock's feather for his cap. At Osuga, the Mongolian prince in charge (theoretically) of the administration of the affairs of the Khalkas has for adjunct (theoretical) a Manchu envoy, the "ambane," who is really the master of the situation; and the decisions made in common (or that are supposed to be) by the two exalted persons are those dictated by the ambane, that is to say, the Peking government.

The Khalkas are nomads, but only relatively so. Within the limits of their hoshun and sumun they periodically shift their quarters in search of "pastures new" for their herds, but

they never travel very far, and it is always possible to find an encampment within a radius of a few miles.

They live under the "yourte," which consists of a light circular framework covered with pieces of felt. The form is that of a dome supported by a small sub-basement, and about 10 feet in height. In order to render it habitable, it suffices to cover it with pieces of felt and close the central orifice above with a movable piece of the same material. Through this orifice the smoke of the "pot à feu" escapes. The fire place is situated in the centre of the abode, the household gods are placed opposite the door, and the housekeeping utensils are arranged along the walls. Around the fireplace are spread out, in lieu of seats, pieces of felt, for which the well-to-do substitute carpets. The princely yourtes are furnished with board floors and decorated with silken hangings.

In summer the men wear wide trousers and a shirt of calico, in most cases blue. Over this they place a long robe, which is buttoned upon the shoulder and side. This is of blue or brown cotton, but sometimes of red or dark green silk. The lamas, or church people—the religion being Buddhism—affect yellow. This robe is gathered in at the waist by a cloth girdle whence, to the right, hangs a knife, and to the left a tobacco bag and tinder box.

Boots with pointed upturned toe and high heel, generally of red leather with a thick sole, complete the accoutrement. The fact that the Mongolian shoemakers make but one size of footgear explains why the son can wear the boots of his father, and why the Mongolian (who also is naturally lazy) does not like to take even the shortest walks afoot. He bestrides his horse in order to travel a distance of a hundred paces, and it is only during the coldest weather that he decides to dismount from his steed in order to walk half a mile or more.

The Mongolians shave and wear a cue. The headgear or national hat consists of a small cone of figured silk or damask, which forms the skull-cap. The rim, which is of black velvet, is turned up so as to describe an acute angle with the central cone. Behind, float two long wide ribbons, which are invariably of red silk. The button or the tuft that crowns the cone is likewise always red. When it rains (a rare event in the Khalka country) the velvet rim is turned down, and the hat assumes the form of an extinguisher that protects the ears and neck. In winter, these hats are replaced by a headgear trimmed with fur, squirrel among the poor, and sable among the rich, the change of hat is accompanied with a change of costume. The long cotton or silk tunic is replaced by a mantle of sheep or deer skin, or among the rich, by a long coat of silk trimmed and lined with costly fur.

The majority of the Mongolians are thin and emaciated. Although they are not strong, they are wiry and capable of withstanding considerable fatigue on horseback. But they object to muscular work. It takes two or three to lift a weight that could be easily handled by one Cossack. To the European eye, they are, with their broad, flat noses, their high cheek-bones, and their little, beady eyes, intensely ugly. They are generally of a low stature, and sometimes have a certain nobility of countenance. Almost

all have a kind, benevolent expression to which one soon becomes habituated.

In their youth, the women are very prepossessing. Their lineaments are refined, their eyes languishing, and their faces plump and smiling like those of the Japanese. They wear the same underclothing that the men do; the same boots and the same hat. But the married women wear a long tunic with very narrow sleeves that are generally red from the middle of the arm to the wrist, which is covered by a small point of the sleeve, if the latter is not rolled up. The robe may be blue, brown, violet, or red, but the sleeve is always red. Above the shoulder the sleeve is padded to a considerable height. A tucker of this same red color covers the top of the throat.

Maidens, whose robes resemble those of men, wear their hair in a single braid hanging down the back. The children go about bravely in *paris naturalibus*, during the summer season, and it is not till they have reached the age of 10 that they are clad in the long national tunic.

The name of the Mongolians became suddenly known in the 13th century, and the world was soon filled with the narratives of the exploits of these nomad warriors. The celebrated chief known to history as Jenghis-Khan (or Genghis-Khan) was born probably in 1162. By his ardor, courage, and successes, he grouped around him a band of young warriors, took part in a number of wars between the Chinese and Mongolians, fighting now on one side and now on the other, subjugated all the tribes living between Irtych and the Khingan Mountains, and in 1206, at the diet of the Mongolian nobles that he had assembled, received the title of Jenghis-Khan, or "the most powerful prince," under which he was to be known to posterity. Marching from conquest to conquest, he soon became master of the southern provinces of China, and in 1210 made himself master of Bokhara and Samarkand. Seven years later, he died, while his army divided into three parts, one of which marched against Afghanistan, another against Russia, and the third completed the conquest of China.

In 1237 the whole of Russia, except Novgorod, was paying tribute to the Mongolians, who next invaded Poland and Silesia, and finally Moravia and Hungary. At this period the power of the Mongolians was at its apogee; but, at the end of the 13th century, it declined, and in 1368 these people were driven from China, and the prince who had occupied the Chinese throne returned to the steppes of the north, with his vassals, where he reigned over his fellow countrymen only. A century later, the Mongolians were beaten and dispersed by the Russians, who had been their vassals for two centuries.

Subsequently, the Khans of southern Mongolia acknowledged themselves vassals of the emperor, Son of Heaven, the "Bogdo-Khan." Northern Mongolia, that is to say, the country of the Khalkas, divided into four principalities, remained independent for a longer time, but in 1691 placed itself under the protection of the emperor of China.

Consult: Gilmour, 'Among the Mongols' (1883); Posdnéef, 'Towns of North Mongolia' (1880); 'Mongolia and the Mongols' (1896-9); Prjevalsky, 'Mongolia and the Land of the Tanguts' (1875-1883-1888).

Mongolian Race, a general name applied to a majority of the people of Asia. In ethnology, the term is used for one of the five great races of the world discriminated and named by Blumenbach, and adopted by Cuvier when he reduced Blumenbach's five to three. The head of the Mongolian is square; the face flattish, nearly as broad as long, the parts not well distinguished from each other, the eyelids narrow, obliquely turned up at their outer angle; the space between the eyes flat and broad, the nose flat, the cheeks projecting, the chin somewhat prominent. The hair is straight, the color black, that of the face and body yellowish (sometimes inaccurately called olive, which implies an admixture of green). The race includes not merely the natives of Mongolia properly so called, but the Tartars, the Chinese, the Japanese, the Cochinese, the Burmese, the Tamuls, the Turks, and the Finns.

Mongolian Subregion. In zoogeography, a subdivision which includes the tablelands of central Asia, from the Caspian Sea to Japan. Its separation from other Asiatic faunal regions is mainly on ornithological grounds, and is neither distinct nor important.

Mon'goose, Monguse, etc. See MUMOOSE.

Mon'ica, Saint, mother of Saint Augustine (q.v.): b. Africa 332; d. Ostia 387. A Christian who, in accordance with the wishes of her parents, also Christians, married a pagan. She devoted nearly all her life to the conversion of her husband and son Augustine. Her self-sacrifice was at last rewarded; her husband, Patricius, became a Christian, and Augustine, seeing the error of his ways, reformed. After the baptism of Saint Augustine at Easter, 387, she set out with her two sons for Africa. Arriving at Ostia she became ill and here died. A friend asked her in Ostia if she were not afraid to be buried in a place so far from her own country. She replied: "Nothing is far from God." Her eminent son preserved many of her holy sayings which he often repeated in his sermons. In the Roman Catholic Church she is regarded as the model and patroness of wives and mothers. Her feast is 4 May. Consult: 'Saint Augustine's Works' edited by Tillemont; Butler, 'Lives of the Saints.'

Monier-Williams, mō'nī-ēr-wil'yams, Sm Monier, English Sanskrit scholar: b. Bombay 12 Nov. 1819; d. Cannes, France, 11 April 1899. He was a son of Monier-Williams, surveyor-general. He was educated at Oxford, and was for a short period a student at the East India College, Haileybury. He was professor of Sanskrit at Haileybury from 1844 to the extinction of the college in 1858, and in 1860 became Boden Sanskrit professor at Oxford, a post which he held till his death. Among his numerous works are: 'Practical Sanskrit Grammar' (1846); 'English-Sanskrit Dictionary' (1851); edition with notes, translations, etc., of the *Sakuntalā* (1853); 'Introduction to Hindustani' (1858); 'Indian Epic Poetry' (1863); 'Sanskrit-English Dictionary' (1872, 2d edition 1899); 'Indian Wisdom' (1875); 'Hinduism' (1877); 'Modern India and the Indians' (1878); 'Religious Life and Thought in India' (1883); 'The Holy Bible and the Sacred Books of the East' (1886); 'Brahmanism and Hinduism' (1889); 'Reminiscences of old Haileybury College' (1894). He traveled extensively

throughout India in order to study the native religions, and to further his scheme of an Indian institute, which he succeeded in getting established at Oxford.

Monism, a philosophical term which may be briefly translated by "doctrine of unity." (See DUALISM and PLURALISM.) The word was coined by Christian von Wolff, a German philosopher of the first half of the 18th century, and is derived from the Greek *monos* which means "single; alone; lonely; unique; existing in only one copy." Wolff, the inventor of many happy terms that acquired currency in philosophy, introduced the word to characterize such philosophies as recognize the existence of one ultimate form of reality only, be it spirit or matter, and he contrasted it with "dualism," that is, the doctrine of duality, held by all those thinkers who believe that both spirit and matter are ultimate forms of existence. Kant had been raised in the school of Wolff's dogmatism and adopted his nomenclature but did not use the word "monism," and so it happened that the term remained dormant for more than half a century. Besides there was no one who would label his own views as monism, as defined by Wolff.

However, the better the interconnection of all things began to be understood, the more was the idea of unity appreciated. A new term was needed and the word "monism" was too expressive to remain neglected. Kant had left a method, but his successors endeavored to work out systems of philosophy, and everyone of them tried to discover the oneness of existence in his own way. Fichte established it in his doctrine of the all-sufficiency of the ego by showing that the objective world is derived from the ego and is in part the expression of the nature of the latter, and in part the necessary condition of its realization and development. Thus Fichte makes the assumption that the subject is the one and the all. Schelling tried to avoid Fichte's error and founded his theory of oneness upon the identity of the subject and the object. Hegel, however, discovered the unity of the world in the object in itself which was neither the object nor the subject, but a higher third power which he called the Absolute, manifesting itself according to its own laws in the phenomenal world of both subject and object. Hegel's philosophy was characterized as monism, and he pointed out how all thought consisted in the search for a higher unity in a contrast of two opposites.

The word "monism," however, began to be prominently applied at the time when Darwinism gained the ascendancy, and now the naturalists among the philosophers, men strongly influenced by Spinoza, who denied any special revelation and rejected the dualism implied by the belief in a miracle-working extra-mundane creator, adopted the name as an appropriate description of their own views. Spinoza's philosophy was praised by them as a consistent monism, and most of them assumed with their master (Spinoza) that there is one substance only and that this one substance manifests itself in two modes of existence, as thought and extension.

Modern psychology is built upon Spinoza's conception of the correlation of thought and extension. It conceives of subject and object, of soul and body, of spirit and matter, of feeling and motion, as a contrast based upon an ultimate

unity. From this principle Weber and Fechner developed their theory of parallelism which was further elaborated by their successors and was brought to a relative completion by Wundt. In England Prof. W. K. Clifford gave it a classical expression in his essay on the 'Nature of Things in Themselves.'

In this way monism gradually acquired the repute of denoting a philosophy that, as a matter of principle, was in strict harmony with scientific methods, and thereby the meaning of the word was again slightly changed; for it denoted no longer a "one substance theory" but any philosophy that in one way or another sought to establish an ultimate unity of some kind. Thus, Prof. Haeckel's monism is a naturalism according to which there is no other reality but matter and energy. Du Prell designates by the same term his spiritualistic world-conception, according to which spirit is the only true existence and matter is, if not practically, yet theoretically, eliminated. Prof. Ludwig Noiré's monism is Darwinism applied to philosophy. His ingenious "Logo-theory" concerning the origin of human speech is based on the maxim that man thinks because he speaks, not *vice versa*. Prof. Max Müller who also calls himself a monist, follows Noiré closely in his monistic interpretation of reason and boldly proclaims the theory of "the identity of language and thought" but shrinks from drawing the last consequence of Darwinism as to the descent of man. The writer understands by monism, "a unitary world-conception" and defines its underlying principle simply as "consistency." To him monism is identical with a genuine positivism (a philosophy built upon the facts of experience) and may briefly be characterized as "the philosophy of science." It is the aim of philosophy to justify the methods of science that everywhere lead to the conception of oneness. All truths must agree; there may be contrasts, but there cannot be any contradiction in truth. Any dualistic conception indicates that there is a problem to be solved and the establishment of monism is everywhere the final aim of all science. Consult: Bradley, 'Appearance and Reality' (1897); Hobhouse, 'Theory of Knowledge' (1896); Avenarius, 'Der menschliche Weltbegriff'; Romanes, 'Mind Motion and Monism.'

PAUL CARUS,

Editor of 'The Monist.'

Moniteur, mō-nē-tēr, La, French journal, established 5 May 1789 by Panckoucke under the name 'Gazette Nationale, ou le Moniteur Universel.'

Monitite. See MONETTE.

Monitor, The, an ironclad, the first of a class of naval vessels designated as monitors (see WARSHIPS). It was designed and built for the United States government in 1861-2 under direction of the engineer John Ericsson (q.v.), who adopted as the most essential feature of its construction the revolving gun-turret devised by the American inventor Theodore Ruggles Timby (q.v.). The Monitor was launched at Greenpoint, L. I., 30 Jan. 1862, only 100 days after the laying of her keel. She put to sea 6 March following, under command of Lieut. John L. Worden (q.v.), arriving on the night of the 8th at Hampton Roads, Va. Extraordinary energy had been displayed by the builders to meet a grave emergency of the gov-

MONITOR AND MERRIMAC

erament, then weak in naval resources, for making effectual the blockade of Southern ports which President Lincoln had proclaimed, as well as for aggressive action and coast-defense. This emergency soon became a dire peril which threatened the destruction of the Union through superior sea power acquired by the Confederacy with foreign aid or connivance. How this danger was first averted is shown in the account of the famous action in Hampton Roads (see **MONITOR AND MERRIMAC**).

Extreme length	178 ft.
Extreme breadth	41 ft. 6 in.
Depth of hold	11 ft. 4 in.
Draft	10 ft. 6 in.
Inside diameter of turret.....	30 ft.
Height of turret	9 ft.
Thickness of turret	8 in.
Thickness of side-armor	5 in.
Thickness of deck-plating	1 in.
Diameter of propeller	9 ft.
Diameter of steam cylinders (two).....	36 in.
Length of stroke	2 ft. 2 in.
Displacement	1,355 tons.
Armament, two 11-in. shell-guns, each 15,668 pounds.	

Theodore R. Timby's Model sent to China by Caleb Cushing in 1843, which suggested to J. Ericsson the Low Freeboard.

The Monitor was built by a company of men, John F. Winslow and John A. Griswold of Troy, N. Y., and their associates, who were actuated by patriotic motives. With T. R. Timby, who had taken out patents "for revolving towers for offensive or defensive warfare whether placed on land or water," they entered into a contract for the use of his inventions covering the revolving turret, paying him \$5,000 as royalty on each turret constructed by them. They built the Monitor at their own risk, Winslow and Griswold furnishing 90 per cent and C. S. Bushnell of New Haven, Conn., 10 per cent of the cost. Ericsson, for his services as engineer, received 5 per cent of the gross sum paid to the company for the Monitor and kindred vessels built by them. A contract with the government was made by the company and Ericsson, and the government paid for the Monitor \$275,000, the actual cost being \$195,000.

In all the models, drawings, and plans of his invention made by T. R. Timby himself, the pilot-house or "lookout" was placed on top of the turret. "For some inexplicable reason," he has said, "the Monitor had her pilot-house placed upon the deck, forward of the turret, in the way of her own guns."

The success of the Monitor aroused much interest in all maritime nations, and was the direct cause of many modifications in the construction of vessels in the navies of Europe, though nowhere except in the United States navy was the monitor adopted as a distinct type of warship. During a gale off Cape Hatteras 31 Dec. 1862, the Monitor was sunk.

JOHN H. CLIFFORD.

Monitor and Merrimac. The contract for the construction of the Monitor was entered into by the Navy Department in the hope that she could be completed before the Merrimac, then building by the Confederates at the Norfolk Navy Yard, could be finished, and that the Monitor would be able to cope with this formidable ironclad. The Merrimac, called by the Confederates the Virginia, was being reconstructed upon the hull of the United States frigate Merrimac, of 3,200 tons, which had been sunk, when the Norfolk Navy Yard was abandoned, by the Union forces, and was subsequently raised by the Confederates. Her armament was two 7-inch rifles, two 6-inch rifles, and six 9-inch smooth-bores.

Each side was aware of the effort of the other to be first ready for active service. The Confederates won by a day. At noon 8 March 1862, the Merrimac, attended by two gunboats, Raleigh and Beaufort, each one gun, was discovered coming out of the Elizabeth River into Hampton Roads (q.v.) and standing toward the Union fleet off Newport News and Fort Monroe, composed of the steam-frigates Minnesota, Roanoke, and Congress, each 50 guns; the sailing-frigate

Ivory model of the turret made by T. R. Timby in 1841; now in possession of the Patriotic League of the Revolution.

The contract with the government provided for the building of "an iron-clad, shot-proof steam battery of iron and wood combined," and the hull of the Monitor was of iron with wooden deck-beams and side-projection. Her dimensions were:

St. Lawrence, 12 guns; and the sloop Cumberland, 24 guns. Their armament was mainly 8-inch and 9-inch guns, with several 10-inch pivot guns. These vessels had the heaviest batteries which the government had been able to assemble to watch the Merrimac. The latter bore down directly upon the Congress and Cumberland. At less than a quarter of a mile the Congress delivered her broadside, her heaviest shot making no impression. The return-fire of shells crashed through her sides with terrible effect. Passing the Congress at 300 yards, the Merrimac received the fire of the heaviest guns of the Cumberland without the slightest harm resulting, and without replying she drove her iron prow through the side of the Union frigate, crushing it, and at the same time pouring in a fire of shells. Leaving the Cumberland rapidly sinking, the ironclad steered for the Congress, which had been run ashore, and from a point 150 yards astern raked her decks with shells which caused general destruction and set the ship afire. The Congress was obliged to surrender. The Cumberland fired a broadside as the water reached the gun-deck, and went down with her flag flying. As she sank, the Confederate steamers Patrick Henry, 12 guns, and the Jamestown, two, came out of the James River and joined the Merrimac. The Minnesota had grounded where the Merrimac could not approach within a mile, and her firing was so bad that only one shot struck the frigate. The other Confederate vessels were finally driven off after inflicting much damage with their rifled guns. After several hours ineffectual attempts to reach the Minnesota, the Merrimac and attending gunboats returned to Norfolk. Several shore-batteries which had attempted to help proved as useless as the batteries of the frigates had been. The Congress continued to burn, and finally blew up. Over half the crew of the Cumberland were lost. The crew of the Congress were made prisoners, but, with the exception of the officers, were released. The total loss was some 250, the Confederate loss was nominal. The battle of an afternoon had ended the day of wooden navies.

The reports of the destruction by the Merrimac caused consternation at Washington, and in the coast cities and, indeed, throughout the North. Secretary Stanton ordered all preparations made for obstructing the channel of the Potomac far below the capital, and warned those in charge of coast-defenses to use every means that could be devised for protection.

Meantime the Monitor, in command of Lieut. John L. Worden, had left New York and after a rough voyage, entered Hampton Roads at 9 o'clock the night after the battle. At 2 o'clock on the morning of the 9th she had anchored alongside the Minnesota. At 6 o'clock the Merrimac appeared bearing down on them, but at first passed by, gained the channel in which the Minnesota lay, and then steamed directly toward her. The Monitor swept in between the two and steered for the Merrimac. At close quarters the latter brought her bow-guns to bear and missed. There was little to fire at except the low turret with a cross-section of 20 feet. The first reply of the Monitor was a solid 11-inch shot which shook the Merrimac from stem to stern. The answer was a broadside, some of the shot of which struck the turret, either glancing or falling as harmless as the shot of the frigates the day

before had proved against the Merrimac. Then followed broadside after broadside without producing the slightest effect on this "cheese-box on a raft," as spectators described it. At every opportunity of maneuver the Monitor closed in and smote with her 11-inch solid shot, bending the heavy armor and straining the timbers of her adversary. Finally the Merrimac left the Monitor and crowded steam for the Minnesota. Upon reaching point-blank range she received a full broadside, and a shot from a 10-inch pivot-gun, without suffering the slightest damage. In reply she raked the Minnesota with a shell, set her afire, blew up a tug alongside, and but for the Monitor, which had followed under full steam, and now swept in between the two, the Minnesota would have shared the fate of the Congress and Cumberland. In changing position to meet the Monitor the Merrimac grounded, and the Monitor continued her hammering with 11-inch shot. As soon as the Merrimac was floated she started rapidly down the bay, pursued by the Monitor. Suddenly she turned and attempted to run the Monitor down. The blow she struck with her prow glanced, and the Monitor was unharmed. The Merrimac then started for the Minnesota for the purpose of ramming her; but when within easy range the Merrimac, with all the Confederate ships, changed course at noon and headed for Norfolk. Her officers subsequently gave as a reason that in attempting to ram the Monitor her iron prow was broken, and their vessel was leaking. The armor was reported damaged, the stem twisted, the muzzles of two guns shot away, and the steam-pipe and smokestack riddled. The casualties were only two killed and 19 wounded. The consternation of the day before at Washington and the North was transferred to Richmond and the South. Preparations were hastily made by the Confederates for blocking the channels in the Elizabeth and Nansemond rivers, and to obstruct the channel of the James.

The Merrimac did not again engage the Monitor, and after the evacuation of Norfolk, which occurred 9 May, she was destroyed by the Confederates.

The Monitor had hurried direct from her shipyard to Fort Monroe and fought without a previous trial-trip, and before she had been accepted by the government. Her five hours' battle settled many questions, and once again in American history had been fired a "shot heard round the world."

H. V. BOYNTON.

Monitor Lizard, the type of a family of pleurodont lizards (*Varanidae*), allied to the typical lizards (*Lacertidae*). They are found in Africa, the Eastern Archipelago, etc., and are the largest of modern lizards, some species attaining a length of 6 or 8 feet. The skin shows little appearance of scales. The tail is long, cylindrical in the terrestrial, but compressed laterally in the aquatic forms, and possesses a sharp under ridge or keel. The limbs are well developed, and the toes provided with claws. Most of these great greenish-gray lizards inhabit rivers and ponds, and are active and fierce enemies of all lesser aquatic life. They feed upon the eggs and young of crocodiles, turtles and aquatic birds; and on fishes, amphibians, swimming-birds, anything, in fact, small enough to be mastered. The most familiar species, probably, is that of the Nile and other African rivers

MONITORIAL SYSTEM—MONKEYS

(*Varanus niloticus*), upon which the English name "monitor" was first fastened by a ridiculous misinterpretation of the Arabic word *mawron* (lizard); it is aquatic and frequently exceeding five feet in length. An equally well known kind is the East Indian monitor (*V. salvator*), which is to be met with from Ceylon and Western India to the Philippines, and is equally at home in the water, on land or in trees. Its rapacity is great and varied; and it is connected with many extraordinary rites and superstitions among the natives, some of which are given in Pennant's 'Sketches of the Natural History of Ceylon' (1861). Australia has a large species (*V. gouldi*).

Monitorial System, or Mutual Instruction, in education, a plan to employ the more advanced boys in school to instruct the younger pupils. The method first occurred to Dr. Andrew Bell, when superintendent of the Orphan Hospital, Madras, in 1795, and was eagerly adopted by Joseph Lancaster, who in the first years of the 19th century did so much for the extension of popular education; and, from him and the originator, the system was called indifferently the Madras and the Lancasterian as well as the Monitorial or Mutual System. The monitorial system is not, as is commonly supposed, a method of teaching; it is simply a method of organizing schools, and of providing the necessary teaching power. See EDUCATION.

Monk, münk, or Monck, George, Duke of ALBEMARLE, English general: b. Potheridge, Devon, 16 Dec. 1608; d. Newhall, Essex, 3 Jan. 1670. At 17 he enlisted and served in the Cadiz expedition under Sir Richard Grenville, a relative; then entered the Dutch army; and returned to England in 1630, fought brilliantly in Scotland and after 1640 in Ireland, and on the outbreak of the civil war kept his commission in the king's army. But in 1644 he was captured by the Parliamentarian forces, and after two years' imprisonment in the Tower, joined the victors, for whom he went to Ulster as governor. Accused of exceeding his powers by arranging a truce (which was almost an alliance) with Owen O'Neill, he was recalled to England in 1649 and reprimanded at the bar of the House of Commons. At the victory of Dunbar in 1650 he did good service; a year later he was made lieutenant-general of the ordnance and in Cromwell's absence was commander-in-chief of Scotland. In 1652 he was made a general of the fleet. He introduced the elements of land tactics into naval formation and administered two crushing defeats to the Dutch, van Tromp being killed in the latter battle. In 1654 he again was sent to Scotland on the Royalist rising as commander of the army, and acted there with much prudence and success. After Oliver's death and Richard Cromwell's resignation Monk set himself to effect the Stuart Restoration, quietly shifted the forces in England until all was so arranged that there was no chance of armed resistance, and then (1660) brought back Charles II.,—a bloodless revolution meeting with general favor. He was made Duke of Albemarle, received other high honors, maintained order and showed rare courage in London during the Plague, but with an empty treasury in 1667 could not keep the Dutch from burning the shipping in the Thames. Short, fat, fair, and wrinkled, Monk was not

a winning personality, being cold, prudent past a virtue, and rather unprincipled; but he was a wonderfully able general, with technical skill rare in one so lacking in theoretical training. His life was written by his chaplain, Dr. Thomas Gumble (1671). Consult also the biographies by Guizot (1838 and 1850); and that by Cobett (1889) in the 'English Men of Action' series.

Monk, Maria, Canadian impostor: b. about 1817; d. 1850. She attained notoriety in 1835 when she came to New York, stated that she had just made her escape from the Hôtel Dieu Nunnery, Montreal, and told most shocking details of convent life. She wrote 'Awful Disclosures' and 'Further Disclosures' in 1836; aroused a strong anti-Catholic movement, the American or 'Know-Nothing' party especially using her story for political purposes; but was exposed and proved an impostor by William L. Stone in his book 'Maria Monk and the Nunnery of the Hôtel Dieu' (1836).

Monk, a bird. See FRIAR-BIRD.

Monk. See MONASTICISM.

Monk-fish, Angel-fish, or Fiddle-fish, a broad, flattened fish (*Squatina angelus*), closely allied to the sharks, but more like a ray in appearance, 5 or 6 feet long, having enlarged, wing-like pectoral fins. It is found near the coast in the warm seas of Europe and North America; it usually stays near the bottom, is from three to four feet long, slow in motion, dull, voracious and useless, except that some shagreen may be obtained from its skin.

Monk-seal, a seal of the genus *Monachus*, so called from a humorous suggestion in its colors to the habit of a monk, the species properly so called is that (*M. albigularis*) of the Mediterranean; but the West Indian seal (*M. tropicalis*) is very similar to it, and is of interest as being almost extinct.

Monkey-bread, the fruit of the baobab-tree (q.v.).

Monkey-flower, any of many plants of the genus *Mimulus* (figwort family), so called because the face of the fox-glove-like corolla suggests that of a cheerful monkey. They are erect, tall herbs, with opposite, clasping, lanceolate dentate leaves, which bear in late summer solitary, axillary irregular blossoms of showy colors. The genus contains some 50 North American species, of which the most familiar is the square-stemmed of the eastern and central States (*M. ringens*). Its flower is violet. A common species on the Pacific coast (*M. guttatus*) has the corolla yellow, often blotched with red or purple.

Monkey Pot, the fruit of a forest tree of Brazil. See BRAZIL-NUT and SAPUCAIA NUT.

Monkeys, a general name for the animals of the highest mammalian order, the *Primates* (q.v.), excepting mankind and the lemurs; ordinarily also excepting the anthropoid apes (see APE) and the baboons (q.v.). The term in fact, then, is suitably limited to three families, considered in their broadest sense, the *Hapalidae*, *Cebidae* and *Cercopitheciidae*. General characters are found in the short hallux, or great toe, being opposable to the other digits of the foot, so that the feet become converted functionally into hands. The pollex, or thumb, of the fore limbs may be absent, but when developed it is usually

MONKEYS

opposable to the other fingers. These animals may thus be called "four-handed" or quadrumanous; hence the old designation *Quadrumanus*. The limbs are nearly of equal length. There is only one pair of mammary glands, which are pectoral in position. In many cases the cheeks are dilated into pouches. The teeth consist of two incisors in each side of each jaw. The premolars or false molars, vary in number. The true molars number three in each side of each jaw, the latter teeth being furnished with tubercles of various sizes and shapes, adapted for crushing fruits and vegetables. The canine teeth are generally strong and of large size. A *diastema* or interval exists between the lower canine and the first lower premolar tooth, and between the upper canine and outer incisor teeth; this interval admitting of the large canines being brought into apposition when the jaws are closed.

For information as to the probable descent and geological history of monkeys, see PRIMATES.

The small American monkeys of the family *Haplorhina*, more usually called marmosets (q.v.), seem to be lowest in the scale of structure and nearest the lemurs, and are by some naturalists separated from the *Cebidae* in a group *Arctopithecini*. They are least in size of the race, have the tail long, hairy and not prehensile; no cheek-pouches or natal callosities; the fore limbs shorter than the hind ones; the thumb not opposable; the ears hairy and of large size; the body covered by a close fur. Their dental formula gives four incisors, two canines, six premolars, and four molars in each jaw—this dentition resembling that of the Old World monkeys, and also that of man himself. The molars are provided with blunt processes. They are confined to tropical America, and wholly arboreal, feed on insects and fruit, and are tamable, gentle and intelligent. See MARMOSET.

Next to these come the *Cebidae*, called New World monkeys, because the family is confined to the American continent, and also known as *Pitheciini*, because of the broad partition in the nose which widely separates the nostrils and causes them to open somewhat laterally. They are characterized by the possession of an extra premolar on each side of each jaw; and by the length and strong prehensility of the tail in most forms—an arrangement by which the end of the tail (naked there on its underside) curls without effort around a limb and clings firmly to it, giving so great assistance in climbing that many of these monkeys exhibit wonderful agility among the trees, grasping and swinging by their tails alone, leaving all four feet (or hands) free. By aid of this truly "handy" appendage some species will join into living chains, by means of which several will hang from a limb enabling the lowest one to grasp desired objects, otherwise unattainable; or will form bridges across spaces too long for the laden mothers or young to leap, and so the whole band will pass over a gap which they fear to cross by descending to the ground or swimming a stream. The ears are rounded and with most of the face, are destitute of hair, there are no cheek-pouches or callosities on the buttocks, so characteristic of the Old World forms. The hind limbs are generally the longer in this section. In the spider monkeys, however, the fore limbs are longer than the hinder members. The thumbs are not

generally opposable, and may be wanting; and the thumb in these monkeys more nearly approaches the other fingers in size and form. Unlike other monkeys, they have the thumb placed in nearly the same plane as the other fingers, so that the mere position of the thumb renders it unfitted. The great toe is generally of large size, and is more capable of being opposed to the other digits than the thumb. The diet is mainly of a vegetable nature, and their life almost exclusively arboreal, a fact which, more than any question of climate, seems to limit them in range to the region of the tropics, between the plains of northern Mexico and those of southern Brazil, since several species dwell in the cold regions of high mountains. Of the *Cebidae* the spider-monkeys (*Ateles*) present very typical examples. In these forms the tail reaches its greatest development as a prehensile organ. The limbs are exceedingly slender, and the thumb is rudimentary. (See SPIDER-MONKEY.) The capuchin monkeys, or Sapajous (q.v.) form the type of the genus *Cebus*, and include many species, as also does the genus *Callithrix* (see SQUIRREL-MONKEY). The howling monkeys (*Myiodes*) are so named from the loud howling noises they are capable of producing, through the possession of a bony "drum," which opens into the larynx, and which greatly increases the resonance of the voice. Other genera are *Pithecia*, the sakis, or hooded monkeys; *Uacaria*, the woolly monkeys; *Chrysomys* or golden monkeys; and *Nictipithecus*, the golden monkeys which are elsewhere described.

The last and highest section of the monkeys (next to the anthropoid apes) is that of the Old World tribe *Cercopitheciidae*, if that family name is used, as is recently the custom, to cover all the formerly called "catarrhine" monkeys, distinguished by their obliquely-set nostrils, the nasal apertures being placed close together, and the nasal septum being narrow. Opposable thumbs and great toes exist in all, except the genus *Colobus*, the members of which want thumbs. The teeth are arranged to exhibit four incisors, two canines, four premolars, and six molars in each jaw; the incisors are prominent, and the canines are especially large and strong—the latter teeth being separated by an interval or diastema from the upper outer incisor, and from the first lower premolar. The tail may be rudimentary or wanting, but in no case is it prehensile. Cheek-pouches, or pocket-like cavities excavated in the cheeks, which are used as receptacles for food preparatory to its mastication, are present in many; and the skin covering the prominences of the buttocks is frequently destitute of hair, becomes hardened, and thus constitutes the so-called natal callosities of these animals. Sometimes these callosities exhibit brilliant colors, and the skin in the neighborhood of the nose, as in the mandrill, may also be striped with gay hues. In their distribution all the catarrhine monkeys inhabit Asia and Africa, a macaque inhabiting the Rock of Gibraltar, and called Barbary ape (q.v.).

Many of these monkeys are small or of moderate size, handsome and graceful. Such are the African guenons, green monkeys and mangabeys (qq.v.) of the genera *Cercopithecus* and *Cercocebus*. Nearly related to them are the macaques (q.v.); and the baboons (q.v.). These have cheek-pouches, and the fore limbs the

AMERICAN MONKEYS.

1. Titi or Death's head Monkey (*Chrysotrux sciureus*)
2. Uakari Monkey (*Uacaria calva*).
3. A group of Capuchins or Sspajous (*Cebus*).

4. Barrigudo (*Lagothrix humboldti*).
5. Spider Monkey (*Ateles bartletti*)
6. Black Couxios (*Pithecia satanas*).

OLD WORLD MONKEYS.

1. Hanuman Monkey (*Semnopithecus entellus*).
2. Negro Monkey (*Semnopithecus maurus*).
3. Green Monkey (*Cercopithecus callitrichus*).
4. Pig-tailed Monkey (*Macacus leoninus*).
5. Bonnet Macaque (*Macacus cynomolgus*).
6. Diana Monkey (*Cercopithecus diana*).

longer. The genera without cheek-pouches and with the hind limbs longer than the fore limbs, are the African thumbless genus *Colobus*, which contains the guerezas (q.v.); and the East Indian tribe *Semnopithecus* which contains the Hindu sacred monkey or entellus (q.v.), the proboscis-monkey, negro monkey and several others described elsewhere under their names, some of which are large and extraordinary.

These Old World monkeys are more varied in their food and activities than are those of America, and are far superior to them in intelligence; consequently they furnish nearly all the pets, circus-performers and servants of wandering musicians that we see from time to time. Many of them breed in captivity, adapt themselves well to civilized life, and betray a surprising ability to learn in various directions, though prone to be inattentive, and growing dull and surly in old age. Few, however, when taken into cold climates live long, even when most carefully treated, as they seem peculiarly susceptible to diseases of the lungs, which usually have a fatal termination.

Excellent accounts of the monkeys of the world exist in the 'Standard,' 'Royal,' 'Caswell's,' and 'Allen's Natural Histories'; the last and most recent being a monograph by Forbes. Otherwise information must be gleaned mainly from the books of scientific travelers.

Monkhouse, William Cosmo, English author: b. England 1840; d. Skegness, Lincolnshire, England, 20 July 1901. He received his education at St. Paul's School in London and in 1857 became a junior clerk in the Board of Trade office with which he was connected with advancement for the remainder of his life. Although not a great poet his work enjoys a high reputation among the works of the minor poets and as an art critic he won considerable attention. His work for the 'Dictionary of National Biography' takes within its scope practically all of British art. He published: 'A Question of Honor,' novel (1868); 'The Works of John Henry Foley' (1875); 'The Italian Pre-Raphaelites' (1887); 'British Contemporary Artists' (1890); etc. Among his poetical works are: 'A Dream of Idleness' (1865); 'The Christ upon the Hill' (1895); etc.

Monks'hood. See **ACONITUM**.

Monmouth, mōn'māth, James, Duke of, claimant to the English throne: b. Rotterdam 9 April 1649; d. London 25 July 1685. He was the natural son of Charles II. and of Lucy Walters, as seems certain from the king's open recognition of him, although he so closely resembled Robert Sidney, whose mistress his mother had been, that Sidney has been supposed his father. He was brought up in France under the care of Henrietta Maria, the queen-dowager; was recognized and summoned to England by his father after the Restoration; was married to Anne Scott, heiress of Buccleuch and made Duke of Monmouth; and served in Holland in 1673. His Protestant sympathies, his clemency to the Scottish Covenanters whom he defeated at Bothwell Bridge (1679), and a story persistently circulated (and denied before Privy Council by the king) that Charles had secretly married his mother in Holland, made him popular with the Protestant party; and Shaftesbury repeatedly urged the king to legitimize him and

ensure a peaceable Protestant succession. He did his best to exclude James from the throne. After the Rye House Plot he escaped to Holland. Thence after the accession of James II. he invaded England, possibly with the complicity of William of Orange, called the people to arms, raised a large force of Protestants, was proclaimed king at Taunton, but was defeated by Faversham at Sedgemoor. Taken prisoner he begged for his life from the king to no purpose, and was executed at the age of 36. He was handsome, weak, fickle, and in his claims to the throne no doubt entirely under the control of political plotters. The 'Diaries' of Evelyn and Pepys give the setting of Monmouth's career; his rising is sketched with some historical verisimilitude in Doyle's 'Micah Clarke' (1888), a romance. Consult also Roberts, 'Life of Monmouth' (1844) and Fea, 'King Monmouth' (1901); the latter work outlines the popular legend that Monmouth was not executed, a substitute having taken his place, and tells how the country people long expected his return.

Monmouth, Ill., city, county-seat of Warren County; on the Chicago, Burlington & Quincy and the Iowa Central R.R.'s; about 95 miles north by west of Springfield. It is in an agricultural region, and nearby are coal fields and valuable clay deposits. It was settled in 1836, and in 1852 was incorporated. The present charter (1904) was granted in 1874.

The chief manufactures are pottery, sewer pipe, stoneware, boxes, agricultural implements, stump-pullers, soap, flour and dairy products. The trade is principally in coal, grain, flour, poultry, dairy products, and live-stock. Monmouth College, founded in 1856 under the auspices of the United Presbyterian Church, is here, also the Warren County Library. The chief city officers are the mayor, who holds office two years, and the council. The waterworks are owned and operated by the municipality. Pop. (1890) 5,936; (1900) 7,450; (1910) 9,128.

Monmouth, Battle of, in American history, a celebrated engagement between the American and British forces, the former commanded by Gen. Washington and the latter by Sir Henry Clinton, which took place at Freehold, Monmouth County, N. J., 28 June 1778. On 18 June Sir Henry Clinton, acting under peremptory orders from the British ministry, evacuated Philadelphia, which had been occupied by his army since the preceding September, and proceeded across New Jersey toward Brunswick, with a view of embarking on the Raritan. On hearing of this movement, Washington broke up his camp at Valley Forge, and, having sent forward some light troops to harass the enemy, started in pursuit. Owing to excessive heat the march of both armies was slow. At Allentown Clinton turned to the right by a road leading through Freehold to Sandy Hook, to embark at the latter place; and Washington, who had hitherto been deterred by the advice of his officers, and particularly of Gen. Charles Lee, from attacking the enemy, determined at once to give him battle. The evening of the 27th found the main body of the enemy encamped on high ground near Monmouth court house, while the American advance, about 4,000 strong, under Lee, was posted at Englishtown, 5 miles distant, with the main body about 3 miles in the rear.

MONMOUTH COLLEGE—MONOCACY

The command of the advance had originally been given to Lafayette, with the consent of Lee; but the latter subsequently applied for and obtained it. Early on the 28th Lee engaged the rear division of the enemy, his orders being to hold it in check until the main body under Washington could come up. The Americans were at first successful, but owing to causes which have never been satisfactorily explained, the whole body soon after fell into a confusion (possibly because of Lee's attempted treason), and commenced a disorderly retreat, closely followed by the British. Washington, who was advancing hastily with the main body, received the first intimation of this movement in the crowds of fugitives who poured along the road. Exasperated at the failure of Lee to execute his orders he rode up to that general and reprimanded him. Then he re-formed them, and hastened back to bring up the main body. Lee, resuming his command, held his position with spirit until compelled to retire and brought off his troops in good order. The main body, which had meanwhile taken a favorable position on an eminence, with a morass in front and a wood in the rear, opened an effective cannonade upon the British. The latter, after an ineffectual attempt to turn the American left under Lord Stirling, directed their chief efforts against the right commanded by Greene, where Wayne, under cover of an orchard, was harassing their centre by a severe fire. To dislodge him Col. Moncton advanced with a column of royal grenadiers, but fell at the head of his troops, who were repulsed with considerable loss. The enemy at length fell back to the ground occupied by Lee in the morning, whither Washington was preparing to follow them when the approach of night and the exhaustion of his men induced him to defer the execution of his plan until the morning. During the night Clinton effected a noiseless retreat, and at daybreak was many miles away from the scene of battle. The excessive heat of the weather and the fatigued condition of the troops rendered a pursuit impracticable, and the royal army was suffered to proceed unmolested to the place of embarkation. The American loss in this engagement was 69 killed and 160 wounded; the British 300 killed and 100 prisoners including wounded. Their total loss by desertions and the casualties of battle during their march through New Jersey has been estimated at 2,000. For his conduct in this battle Lee was court-martialed and suspended for one year from his command.

Monmouth College, in Monmouth, Ill., a coeducational institution, under the auspices of the United Presbyterians. It was founded in 1836, and in 1910 there were connected with the school 28 professors and instructors and 435 students. There were about 8,000 volumes in the library; the grounds and buildings were valued at \$125,000; the productive funds amounted to \$275,000, and the annual income was about \$43,000. The departments are the preparatory, music and art, and graduate. The college courses consist of nine groups which lead to the degrees of B.A. and B.L.

Mono, mō'nō, a lake or "sink" in Mono County, Cal., on the eastern slope of the Sierra Nevada, about 150 miles southeast of Sacramento. The lake is circular in form, nearly 15 miles across; area, about 200 square miles. A

short railroad passes along the eastern shore. A number of streams enter the lake, but it has no apparent outlet. The waters are alkaline and contain no fish. A species of insect deposit their ova on the surface of the waters, and sometimes so great are the numbers that they look like islands. The Digger Indians collect the insects and ova, and prepare from them an edible delicacy. See KOOCMAH-MEZ.

Mono, the common name in Guatemala for the Central American howling monkey (*Mycales villosus*).

Monocacy, mō-nōk's-si, Battle on the. In 1864 (4 and 5 July) Gen. Early, after driving the Union forces, under Gen. Sigel, from the lower Shenandoah Valley, crossed the Potomac into Maryland north of Harper's Ferry, on his march to Washington, demonstrated on Sigel, who had retreated to Maryland Heights and, crossing South Mountain by Turner's and Cramp-ton's Gaps, concentrated his main body on the night of the 8th near Middletown in the Catoctin Valley, his cavalry, after some sharp skirmishing during the day, being in advance, between Middletown and Frederick. Meanwhile Union forces had gathered to oppose his march. Gen. Lew Wallace, commanding the Middle Department, with headquarters at Baltimore, on the 6th collected a mixed force, numbering 2,700 men, under Gen. E. B. Tyler, at Monocacy Junction, near Frederick, and disposed it to cover the Baltimore & Ohio railroad and its bridge, and the Baltimore pike with its stone-pier bridge. Cavalry was sent out on the road beyond Frederick, which ran into Bradley T. Johnson's cavalry, and fell back. On the 8th Wallace was joined by a part of Ricketts' division of the Sixth corps from the Army of the Potomac, which was advanced to Frederick, but during the night it was withdrawn and crossed to the east bank of the Monocacy, where meanwhile other parts of Ricketts' division had come up by rail from Baltimore. Ricketts' division of about 3,350 men was formed on Tyler's left, covering the Washington road and its wooden bridge. Both flanks and the fords were guarded by cavalry, and skirmishers were deployed on the bank of the river. Wallace had but six field-guns; three were given to Tyler and three to Ricketts. An earthwork and two blockhouses commanded both the railroad bridge and the bridge on the Washington road. On the morning of the 9th Early advanced from Frederick to attack Wallace. Rodde's division on the left, along the Baltimore Pike, and Ramseur's in the centre on the Washington road, while Gordon's division, following McCauland's cavalry, inclined to the right to reach the fords a mile below Wallace's left. Rodde and Ramseur drove the Union skirmishers to the banks of the river; Ramseur drove those in his front beyond it; and four heavy batteries of 16 guns crowning the heights near the river, at 9 a.m. opened fire upon the Union lines opposite. By noon the Confederate cavalry had forded the river, and dismounting, advanced on Ricketts' left, gaining a temporary advantage, but were soon driven back. Gordon then crossed his infantry and reinforced the cavalry Ricketts, holding on to the bridge with his right to check Ramseur, changed front to the left and engaged Gordon and the cavalry, sometimes yielding ground, and again regaining it, but the enflading fire of the

guns across the river, and the continued heavy pressure of Gordon on his front, right, and left flanks, caused Wallace at 4 p.m. to withdraw him toward the Baltimore Pike, having first burned the wooden bridge and the blockhouse at its farther end. Tyler had continued to hold his position against Rodes, in part west of the river, covering the stone bridge of the Baltimore Pike, but Gordon's troops, following up the east side of the stream, on Ricketts' heels, struck the pike before the bridge-guard could get away, capturing several hundred prisoners, Tyler narrowly escaping. Wallace fell back by the Baltimore road in the direction of Ellicott's Mills, Early following but a short distance. Early buried his dead and sent over 400 of his severely wounded to the hospitals in Frederick. He levied and collected \$200,000 from the citizens of Frederick, seized a good supply of shoes, bacon, and flour, and on the morning of the 10th resumed his march on the direct road to Washington, halting at night within four miles of Rockville. The Union loss at Monocacy was 123 killed, 603 wounded, and 568 missing, a total of 1,294, of whom 1,073 were of Ricketts' division. Early reports his loss as about 700 killed and wounded, but it must have been greater, as Gordon reports the loss in his division alone as 668. The great importance of the battle on the Monocacy lies in the fact that the day gained in delaying Early enabled the remainder of the Sixth corps to reach Washington from Grant's army, as well as a part of the Nineteenth corps from New Orleans, before Early could make an attack on the city. Gen. Grant says: "Whether the delay caused by the battle amounted to a day or not, Gen. Wallace contributed on this occasion, by the defeat of the troops under him, a greater benefit to the cause than often falls to the lot of a commander of an equal force to render by means of a victory." Consult: 'Official Records,' Vol. XXXVII.; Pond, 'The Shenandoah Valley in 1864'; Grant, 'Personal Memoirs,' Vol. II.; Early, 'Last Year of the War for Independence'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Mon'ochord, a musical instrument with one string, invented by Pythagoras, and much employed by the ancients in the musical training of the voice and ear. The modified form of the instrument used in natural philosophy lecture-rooms is often called a sonometer; it consists of one or more strings stretched over a sounding-box. A string is fastened at one end of the box, and passes at the other end over a fixed pulley, which enables it to be stretched by means of weights; it passes over two fixed bridges near the ends of the box, and there is a movable bridge between to alter the length of the vibrating portion of the string. Strings are employed to produce musical sounds in the violin, harp, guitar, piano, etc. The sonometer is an indispensable piece of apparatus to lecturers on acoustics not only for the proof of the law of vibrating strings, but also to illustrate the relations of harmonics and the fundamental ideas of undulations. See VIBRATION; PIANO-FORTE.

Monochromatic Light, in physics, a light which consists of a single color which is so pure and so definite that when it is examined by

the spectroscope it gives but a single bright line. An approximately monochromatic light may easily be obtained by volatilizing salt, or some other sodium compound, in the flame of a Bunsen burner. An orange-yellow color, of great purity, results. Viewed by this light, everything white or yellow looks bright, while vermilion, ultramarine and other colors that do not contain any sensible proportion of yellow, appear black. Monochromatic light is greatly used in physics, for the study of certain kinds of phenomena in optics.

Mon'ochrome (Greek, *monos*, single, and *chroma*, color), in ancient art, a painting executed in a single color. The first specimens of the art of painting were of one tint only, which was most commonly red, made either with cinabar or minium. Instead of red, white paint was sometimes used. The first four plates in the first volume of the paintings of Heracleum contain several monochromes upon marble. The most numerous monuments existing of this kind of painting are on terra cotta. A painting, to be a proper monochrome, must be relieved by light and shade.

Monoclin'ic System. See CRYSTAL.

Monocotyle'dons, plants of that grand division of angiospermous plants whose embryos sprout in only one seed-leaf or cotyledon, which springs from one side of the axis of growth; the opposite of Dicotyledons (q.v.). In one system of botany the term was employed as a synonym of *Endogens*, but this use is obsolete.

Monodel'phia, the name formerly applied to all mammals esteemed higher than marsupials (*Didelphos*) considered as a group distinguished primarily by the fact that the uterus or womb is single, and shows a single uterine cavity. It has been shown, however, that this distinction does not hold, and the term has consequently become obsolete.

Monoc'ius Inflorescence. See DICUSIOUS FLOWER.

Mon'ogram (*monos*, single or only, and *gramma*, meaning "a single mark"), a character or cipher composed of one, two, or more letters interwoven, being a sort of abbreviation of a name, used as a seal or badge, in coats of arms, etc. Monograms were much used on coins, by the Romans, for instance, though they did not employ them on inscriptions; and were also used on standards, walls and tapestry, seals and documents; first on coins, latest on documents, in which they were employed not only by princes and ecclesiastical dignitaries, but also by magistrates and notaries. At the commencement of the Christian period their use was universal. The titles and rubrics of Greek manuscripts are frequently monogrammatic, and numerous and diversified monograms are found in Latin manuscripts. Alphabets like the Roman, of an angular character, have many letters with corresponding parts; and the upright strokes, the horizontal lines, and the curves are easily made by arranging them so that the similar portions shall coincide, to produce numerous combinations. Monograms are generally combinations of more than two letters; when only two were incorporated they were generally designated ligatures. After the 12th century they gradually went out of use. The use of them remained

MONOLITHS—MONOPLEGIA

longest in Germany, where it was formally abolished by the Diet of Worms, in 1495. The knowledge of monograms of this public kind is of great importance for the illustration of the monuments and documents of the Middle Ages, and therefore forms a particular branch of diplomatics; for they were much employed in the mediæval diplomatic art. The term was subsequently applied to all sorts of ciphers and signs, with which artists, particularly painters and engravers, were accustomed to designate their works. The mediæval seal-engraver, to economize as much as possible the annular space available for the legend, favored much both ligatures and monograms. Many of those seals had the initials of their owners blended and incorporated with the devices, called merchant-marks, corresponding somewhat to the modern trade-marks, which were the stamp, as it were, by which the work of each artist was known. Many of the modern monograms are copied from mediæval examples. Consult: Bruliot, 'Dict. des Monogrammes' (1832-34); Duplessis and Bouchot, 'Dict. des Marques et Monogrammes de Graveurs' (1886-7); Bouvenne, 'Les Monogrammes Historiques' (1870); Fagan, 'Collectors' Marks' (1883).

Monoliths. See **STANDING STONES**.

Monometallism, the principle of having only one metallic standard in the coinage of a country, opposed to bimetalism. See **BIMETALLISM**; **COINAGE**; **CURRENCY**.

Monona, mō-nō'nā, a lake in Wisconsin, one of a group of lakes near Madison in Dane County. See **FOUR LAKES**.

Monongahela, mō-nōn-ga-hē'lā, a river which has its rise in the northwestern part of West Virginia, and flows north into Pennsylvania, where it unites, at Pittsburg, with the Allegheny and forms the Ohio River. The headwaters of the Monongahela are in the Alleghany Mountains near the headwaters of the Potomac. The two head-streams of the Monongahela unite near Fairmont in Marion County, W. Va., and from the point of junction on the north become a swiftly flowing stream, furnishing water-power for several manufacturing towns and cities. The whole course is very irregular; the length is about 300 miles. It has been made navigable about 106 miles from its mouth to Morgantown, in Monongalia County, W. Va., by a system of locks, nine in number. Other locks above Morgantown are being constructed and government plans to make the river navigable as far as Fairmont are being put into execution (1903). The largest tributary is the Youghiogheny, a navigable river, which has its source in the mountains in the southwestern part of Garrett County, Md., and enters the Monongahela near Pittsburg. The Cheat River, the next largest tributary, is a stream in the northeastern part of West Virginia. It joins the Monongahela in Pennsylvania, a few miles north of the border. The river flows through a country which has fertile farm lands in the valley, and the whole section is rich in coal.

Monongahela City, city in Washington County, Pa.; on the Monongahela River, and on the Pennsylvania and the Pittsburg & L. E. R.R.'s; about 32 miles south of Pittsburg. It is in a coal region, in which the chief industries are coal mining and manufacturing. It was set-

tled in 1792 by Joseph Parkinson, was incorporated as a borough 3 April 1833, and chartered as a city 24 March 1873. It has (1903) 15 large industrial establishments, employing about 5,800 persons, or about 600 more than the whole population as given by the Federal census of 1900. The chief manufactures are glass, foundry and machine-shop products, flour, lumber, and paper. It has considerable trade in the home manufactures, and in coal and farm products. The principal buildings are 11 churches, five public schools, an academy, and a Memorial Hospital. The four banks contain a combined capital of \$2,500,000. The government is administered under the original charter, and provides for a mayor and a council of 12 members, all of whom are elected annually. The majority of the inhabitants are American born, but there are quite a number of Italians and Slavs. Pop. (1890) 4,096; (1900) 5,173. In 1910 the population was 7,598.

VERNON HAZZARD,

Editor 'Republican,' Monongahela, Pa.

Monophysites, those followers of the heretical opinion in the early Church, which ascribed but one nature to Christ in contradistinction to the orthodox doctrine that he was true God and true man. The Monophysites were mainly confined to the Eastern Church, and obtained no footing in the West. The edict called Henoticon, issued by the Emperor Zeno in 482, was not able to quiet the long and often bloody contests incident to this controversy, and the orthodox church, by its sentences of excommunication, occasioned a formal secession on the part of the Monophysites. This separation took place in the first half of the 6th century. Nor did they remain united among themselves. In 519 controversies arose among them respecting the question whether the body of Christ is corruptible or not. About 560 a Monophysite, Askunages, and after him Philoponus, a noted Alexandrian philosopher of that century, conceived the idea of styling the three persons of the Deity three Gods. These Tritheists and their adherents, even in the eyes of the Monophysites, were the rankest heretics, and were the occasion of many Monophysites turning Catholics. In Egypt, Syria, and Mesopotamia the Monophysite congregations, however, remained the strongest, had patriarchs at Alexandria and Antioch, existing, without interruption, by the side of the imperial orthodox patriarchs; and after the Syrian, Jacob Baradaeus, had, about 570, established their religious constitution, formed the independent churches of the Jacobites and Armenians, which separated from the Greeks as well as the Romans, and have for that reason been able to maintain themselves since the 7th century, even under the dominion of the Mohammedans. Excepting their peculiar doctrine of one nature in Christ, they coincide, in the main points of belief, with the Greek Church, their worship also resembles the Greek rather than the Roman, but has, from their national character and their superstition, received variations, which are most striking in the religious constitution of the Egyptian Jacobites (qv). See **JACOBITES** and **Armenian Church** under **ARMENIA**.

Monoplegia, mōn-ō-plē'jā (from Greek *monos*, single + *πλεγή*, a stroke), a paralysis limited to one organ or part. It is caused by

MONOPOLY — MONOTHEISM

circumscribed lesions of the nervous system, in brain, spinal cord, or nerves. An example of such paralysis is *monoplegia facialis*, Bell's palsy (q.v.).

Monopoly (Greek, *monopolia*, single or sole selling) is an exclusive right, secured to one or more persons, to carry on some branch of trade or manufacture, in contradistinction to a freedom of trade or manufacture enjoyed by all the world. The most frequent monopolies formerly granted were the right of trading to certain foreign countries, the right of importing or exporting certain articles, and that of exercising particular arts or trades. Such exclusive rights were very common in Great Britain previous to the accession of the house of Stuart, and were carried to an oppressive and injurious extent during the reign of Queen Elizabeth. The grievance at length became so insupportable that, notwithstanding the opposition of government, which looked upon the power of granting monopolies as a very valuable part of the prerogative, they were abolished by an act of 1624. This act secured the freedom of industry in Great Britain; and has done more, perhaps, to excite a spirit of invention and industry, and to accelerate the progress of wealth, than any other in the statute-book. There is one species of monopoly sanctioned by the laws of all countries that have made any advances in the arts, namely, the exclusive right of an invention or improvement for a limited number of years. It is, in fact, a kind of property created by law for the benefit of the inventor, and which he could not effectually acquire or secure without the aid of the law. The exclusive right of an author to the publication of his own work is hardly a monopoly, but rather a right of property, resting upon the same principle as the right to lands or chattels. The law, therefore, by giving an author the exclusive right to the publication of his own work for a limited number of years makes no grant; it is only allowing him what is his own for a limited time. But the exclusive right to the use of an invention or improvement is a monopoly, since it deprives others, for that period, of the chance of the advantage of making the same improvement, discovery, or invention themselves. Capitalists, either single or combined, may produce commodities so much better and cheaper than others can do as practically to command the entire sale, and are in popular language called monopolists. But having no legal rights or advantages that are not open to all, they are not in the legal sense in possession of a monopoly. In the oldest sense of the term they are monopolists; but since the term is now used in an unfavorable sense, its discontinuance as applicable to these is only just. It may be assumed as an economical axiom that every interference with absolute freedom in acts of exchange can be defended only on the highest grounds of public policy. Any advantage given to a particular interest is not only a wrong to the general public, but will in time bring a just retribution to the favored class.

In the United States the only monopolies that the laws and the individual States look on with favor consist of the post-office, which is a government monopoly, and the rights granted to individuals under the patent and copyright laws. Monopolies commonly known as trusts are looked on with odium, and various States have

enacted laws making a trust an illegal combination of individuals. See *Trusts*.

Mon'othelism (Greek *monos*, only one; *theos*, god), the belief in the existence of one only, as opposed to a belief in many gods, polytheism. Even in polytheisms there is generally some chief and predominant deity, and many investigators believe that the belief in a divine power and person may be traced through three stages of development. The vague impression which savage man receives from witnessing the operations of nature changes into a conviction that there is some superior and invisible power overruling all things; to the agency of this power he attributes the suffering, disease and death which he meets with in the experience of life. This unanalyzed power is dimly conceived of by him as one and all pervading, and primitive deism of this kind has received the name of *Henothelism* (from the Greek *hen*, *theos*, one). It is only when fancy and imagination begin to operate, and the clouds of superstition to darken, that this unified power is differentiated, and each manifestation of it, in the sea, the sky, the soil, is attributed to a specific agent. The complicated mythologies of Greece and Rome are high developments of original henothelism, rather than proofs of degeneracy. In the earliest stage of human development science and theology are one, and must advance together; they can only advance by analysis, which reveals the differentiation of species, and concomitant complexities. Hence the discovery of a new god every time the mind has been concentrated upon a single and distinct operation or phenomenon of nature, whether it be the rainbow, the storm at sea, or a volcanic eruption. When science and theology are once divorced, the result must be either monothelism or atheism.

The history of monotheism may be thus summarized. According to Professor Max Müller the conviction of the existence of one God was not an intuition, but the result of a gradual education. It is held by some that the third chapter of Genesis embodies the doctrine of the unity of the Godhead, and of a co-equal and co-eternal Trinity. In the earlier Vedic writings, which exhibit the most primitive workings of the human mind of which we have any record, we find that a consciousness of their own existence led men to endow every created object with life. The natural issue of such a condition of thought was either polytheism or fetishism, that is, either a plurality of deities with human forms and passions, or an abject terror of inanimate objects. But anthropomorphic polytheism did not determine the convictions of the highest thinkers under the system, such as Buddha, Confucius, Socrates, Plato, etc. The writings of Confucius, Buddha, Plato and even Hesiod and Sophocles prove that the religious convictions of a people are not to be measured or tested by the gross details and elaborate observances of a mythological system. The Jewish prophets had a firm persuasion of one God, the Father and Judge of all; but they are continually upbraiding the people for lapsing into polytheism. After the Babylonish captivity the people became fixed in their belief; and now the Jews and Mohammedans hold the doctrine of the divine unity with as great rigor and tenacity as modern Christians. They will not countenance even the Trinitarian conception of Deity, although this is as purely

MONOTHELITES—MONROE

monotheistic as their own anthropomorphic notions of the Supreme Being. The monotheism of the Hebrews came to Europe as a systematized doctrine, just when Greek philosophy had succeeded in sweeping away the last vestige of polytheism among the civilized peoples of the Mediterranean basin. It came with the added enthusiasm of Christianity and conquered the world. See GOD, TRINITY.

Monothelites (Greek, *monothēlētai*, from *monos*, and *thēlo*, I will), a sect of heretics who maintained that though Christ had two natures co-existing distinctly in the unity of the person, yet these natures possessed or acted by but a single will—the divine, which so predominated over or absorbed the human as to deprive it of all action or efficiency. They have been regarded as an offshoot of the Monophysites, though they themselves denied all connection with them. The doctrine originated with the Emperor Heraclius, who in 630, by adopting a middle course, attempted to reconcile the Monophysites to the orthodox church. The attempt was for a time successful. Heraclius consulted Sergius I., patriarch of Constantinople, on the new dogma, and he not only approved of it, but became its most active propagandist. At his instance, and mainly in consequence of his representations, Pope Honorius I. addressed two letters to Sergius, which according to some interpreters would seem to favor Monothelism. The successors of Honorius condemned the Monothelites, and Martin I., in 649, issued a bull anathematizing them. For this he was sent prisoner to the Chersonesus by the Emperor Constantine, who protected the Monothelites. The sixth ecumenical council, that of Constantinople (680), condemned this heresy, and with this the early controversies on the incarnation became gradually fainter, till they were forgotten amid the disputes between the Iconoclasts and their opponents.

Monotrem'ata, an order of mammals belonging to the subclass *Prototheria* (q.v.) and represented by the duckbill (q.v.) of Australia and Tasmania, and the spiny ant-eaters (see *ECHIDNA*), the range of which extends into New Guinea. In many respects they recall the *Sauropsida* and especially the birds, a fact reflected in the name *Ornithodelphia* sometimes applied to them. The most marked of these peculiarities are the obliteration of the sutures of the skull, the possession of a terminal canal (cloaca) into which both the digestive tract and the urogenital organs empty; the possession of a well developed coracoid bone; and the fact that they do not, like other mammals, bring forth living young, but lay eggs. After the eggs are laid they are transferred to a temporary pouch beneath the abdomen, where they hatch and the young are nourished by the mammary glands.

Mon'otype. See COMPOSING MACHINES.

Monoxid, in chemistry, a compound consisting of one atom of oxygen united to one atom of another divalent substance, or of one atom of oxygen united to two atoms of some other

monovalent substance. The word is used when it is necessary to distinguish two or more states of oxidation of the same substance. Thus CO is called 'carbon monoxid,' in distinction to CO₂, which is called 'carbon dioxid.' Similarly Na₂O is 'sodium monoxid,' while Na₂O₂ is 'sodium dioxid.' See OXIDE.

Monro, mūn-rō', Alexander, Scottish anatomist: b. London 8 Sept. 1697; d. Edinburgh, 10 July 1767. He studied at Edinburgh, afterward in London under Cheselden, and still further both in Paris and Leyden, at the former under Bouquet, and at the latter under Boerhaave. On his return to Edinburgh in 1719 he was made professor of anatomy and surgery to the surgeon's company; in 1720, the first university professor of anatomy, though not inducted till 1725. He attended the wounded on the field at Prestonpans (21 Sept. 1745), and was an accurate observer, having studied the effect of the presence of solid bodies in the vermiform appendix, and otherwise anticipated later views. He resigned his professorship in 1764. His principal work is 'Osteology, a Treatise on the Anatomy of the Human Bones' (1726), once a popular text-book.

Monro, Alexander, known as Secundus; Scottish anatomist: b. Edinburgh 20 May 1733; d. there 2 Oct. 1817. He was son of Alexander Monro (1697-1767) (q.v.). Educated at Edinburgh University (M.D. 1755), he also studied on the Continent, and in 1759-1808 lectured at Edinburgh. In 1783 he described the communication between the lateral ventricles of the brain, known as the foramen of Monro. He published 'Three Treatises on the Brain, the Eye, and the Ear' (1797) and other medical works.

Monro, Alexander, known as Tertius, Scottish anatomist: b. Edinburgh 5 Nov. 1773; d. Craiglockhart, near Edinburgh, 10 March 1859. He was the son of Alexander Monro (1733-1817) (q.v.). He obtained his M.D. at Edinburgh in 1797, was appointed conjoint professor with Monro Secundus of medicine, surgery and anatomy, and in 1817-46 was sole professor. His works include 'Observations on Crural Hernia' (1803), and other publications, of no permanent value.

Monroe, Harriet, American author: b. Chicago, Ill.; 23 Dec. 1860. She was graduated from the Visitation Academy, Georgetown, D. C., in 1879 and has since devoted herself to literature. In 1889 she wrote the text of the cantata given at the opening of the Chicago Auditorium and in 1891 wrote by request of the committee the 'Columbian Ode' which was sung at the dedicatory ceremonies at the World's Columbian Exposition in 1892. She has published: 'Valeria and Other Poems' (1892); 'John Wilborn Root—a Memoir' (1896), etc.

Monroe, James, fifth President of the United States: b. in Westmoreland County, Va., 28 April 1758; d. New York 4 July 1831. He was descended from a Scottish cavalier family, studied for a short time at the College of William and Mary, which he left on the outbreak of the Revolutionary War to enlist in the Continental army, and in 1776 became lieutenant in a Virginia regiment. He served in the campaign on the Hudson, taking part in the battles of Harlem Heights and White Plains. Accom-

JAMES MONROE.
Fifth President of the United States.

MONROE

panying Washington in his retreat through New Jersey, he distinguished himself at the battle of Trenton, where he was wounded. As major on the staff of Lord Stirling (William Alexander) he served in the campaigns of 1777-8, winning credit in the battles of Brandywine, Germantown, and Monmouth. Having lost his rank in the line by becoming a staff-officer, and failing in an attempt to raise a regiment which was authorized by the legislature of Virginia, he withdrew from the military service, made the acquaintance of Jefferson, and with him studied law, the two forming a life-long intimacy. During the subsequent invasions of Virginia he took an active part in organizing the militia for defense. In 1782 he was elected to the Virginia legislature, and was also appointed a member of the Executive Council. In the Congress of the Confederation, where he served from 1783 to 1786, he advocated extension of the powers of that body, and the favorable action upon his motion to this end was a distinct step toward the formation of the Federal Constitution to supersede the inadequate Articles of Confederation. On the important questions of the time—trade between the States, public lands, navigation of the Mississippi, etc.—he acquired authoritative information which gave him great influence in the deliberations of Congress. Retiring from that body in 1786, he was again elected to the legislature of Virginia, and in 1788 was chosen a member of the State convention called to act upon the ratification of the Federal Constitution, which he joined with Patrick Henry and others in opposing, objecting to the centralizing features of that instrument. In 1790 Monroe was elected to the United States Senate, where he served until 1794, acting with the Anti-Federalists in earnest opposition to Washington's administration. Notwithstanding this attitude, in 1794 he was appointed minister to France, to succeed Gouverneur Morris, and on his arrival there was enthusiastically welcomed, being received with much fervor in the Convention. As his sentiments toward France at the time were far more cordial than those of his government, he allowed himself expressions before the Convention which met with strong disapproval from the administration, and his conduct in other matters not commending itself to the American government, in 1796 he was recalled. This action led to much controversy after his return, upon which he published a defense that still further strained his relations with the administration.

After a season of retirement Monroe, in 1799, was elected governor of Virginia and served three years, and in 1803 President Jefferson sent him as special envoy to France, to act with Robert R. Livingston, the resident minister, in completing the negotiations which resulted in the Louisiana Purchase (q.v.). In 1803 Monroe was also sent as minister to England; and pending negotiations there concerning the rights of neutrals and the impressment of seamen, he was ordered to Spain to adjust a question of the Louisiana boundary. Failing in this, as he had previously failed in negotiations with Spain for the purchase of the Floridas, in 1806 he was recalled to England, where a treaty was concluded which proved unsatisfactory to the President, who declined to lay it before the Senate, and upon his return to the United States in 1807 Monroe found himself

once more the cause of controversy and involved in a misunderstanding, happily only temporary, with Jefferson. In 1810 Monroe was again elected to the Virginia legislature, and in the following year became a second time governor, but was soon after appointed secretary of state by President Madison. In this office he continued until his election to the presidency, during part of the time acting also as secretary of war. He served with energy and success in both departments, especially during the military operations of 1814-15.

In 1816 Monroe was elected President as the candidate of the Republican (previously Democratic-Republican) party, receiving 183 votes in the electoral college against 34 for Rufus King, candidate of the Federalists. Soon after his inauguration he made an extended personal inspection of military posts and resources, acquiring much knowledge of the condition and needs of the country, winning great popularity, and by his bearing and addresses doing much to prepare the public mind for that "era of good feeling" which made his administration memorable, and during which, in the general prosperity, political rancor was almost stilled. When four years afterward Monroe was re-elected he received all but one of the electoral votes, party divisions having largely disappeared. The President had also established himself in popular favor, especially by the acquisition of Florida from Spain in 1819, a sequel of the Seminole war.

While the eight years of his administration were not marked by stirring events, they showed important results in seaboard defense, strengthening of the army and navy, development of the country's resources, internal improvements, protection of commerce, and increased efficiency of the public service. During this period five States were admitted to the Union—Mississippi (1817), Illinois (1818), Alabama (1819), Maine (1820), and Missouri (1821). To the earlier apprehension of trouble through jealousy between the larger and the smaller States had succeeded the graver problems presented by the question of slavery, through which the "era of good feeling" was to give way to new strife of parties and sectional dissensions. The first great encounter in this conflict ended in the Missouri Compromise (q.v.), one of the chief political incidents of Monroe's administration. Yet when in 1824 Lafayette visited the United States he found here a people apparently enjoying every prospect of continued peaceful development, for it was believed that the compromise had finally settled the slavery question. But perhaps the most important result of Monroe's administration is that which followed from its expression of sympathy for South American republics, the promulgation of the Monroe Doctrine (q.v.).

His second term having ended, Monroe retired to private life in 1825, and returned to his residence in Loudoun County, Va., but he subsequently served as justice of the peace, and performed his last public service as a member of the Virginia Constitutional Convention, which met in 1829, and over which he presided until ill health compelled him to resign his membership. He removed to New York a short time before his death. From that city, in 1858, his remains were taken to Richmond, Va., and there re-interred with elaborate and befitting ceremony.

MONROE—MONROE DOCTRINE

Consult: Gilman's biography in the 'American Statesman' series (1883; 2d ed. 1898), with bibliography of Monroe and of the Monroe Doctrine; Monroe's 'Writings,' edited by S. M. Hamilton (1898—); and the calendar of his 'Correspondence' in Bulletin No. 2, 1893, of the Bureau of Rolls and Library, State Department.

Monroe, La., city, parish-seat of Ouachita Parish; on Washita River, and on the Missouri P., and the Vicksburg, S. & P. R.R.'s; about 155 miles north by west of Baton Rouge and 55 miles east of Shreveport. It has steamer connections with a number of towns on the Washita River. It is in an agricultural section in which raising cotton and lumbering are the chief industries. There are cottonseed-oil mills, cotton compresses, brick yards, lumber mills, and wooden ware factories. There is a large trade in cotton and lumber. Pop. (1890) 3,236; (1900) 5,428; (1910) 10,209.

Monroe, Mich., city, county-seat of Monroe County; on the Raisin River, and on the Michigan S., the Pere M., the Michigan C., and the Lake S. R.R.'s; about 40 miles southwest of Detroit and 85 miles southeast of Lansing, the capital of the State.

It was settled in 1784 by people from Canada, and was first called Frenchtown. In 1815 the name was changed to Monroe in honor of James Monroe (q.v.). It was chartered as a city in 1836. Here took place 22-23 Jan. 1813 the 'Battle of Raisin River.' The American losses in the battle were 397 killed, 537 captured; and the British losses were 24 killed and 158 wounded. Only 33 of the Americans escaped. A number of the American wounded and prisoners were left here by the British, in charge of a few soldiers. The Indians attacked and massacred all of them. The battle cry used later in the War of 1812 and afterward when disputes arose with the British, was, 'Remember the River Raisin.'

The city is in a fertile agricultural region and a trade centre for a large section of the southeastern part of the State. Its principal manufactures are flour, lumber, paper, paint, brick, agricultural implements, stoves, furnace products, furniture, and canned goods. The nurseries nearby and the fisheries give employment to a number of people. The chief buildings are the court-house, opera house, armory, and two orphan asylums, a home for the aged, Saint Mary's Academy, a public library, and a convent. It has the mother house of the Sisters of the Immaculate Heart of Mary, a teaching order of Sisters who have schools in various parts of the country, and whose pupils number about 10,000. In connection with the convent and academy are a large library and a fine museum. Pop. (1910) 6,893.

Monroe, N. C., city, county-seat of Union County; on the Seaboard Air Line railroad; about 120 miles, in direct line, southwest of Raleigh. It is in a cotton growing region, and nearby are gold mines. The chief industrial establishments are cotton mills, cotton gins, lumber mills, and iron works. The trade is principally in cotton, iron products, lumber, and tobacco. Pop. (1910) 4,082.

Monroe, Wis., city, county-seat of Green County; on the Chicago, M. & St. P. and the Illinois C. R.R.'s; about 40 miles south by west

of Madison. It is situated in an agricultural and stock-raising region, but its manufactures are quite important. In 1859 it was incorporated as a village, and chartered as a city in 1882. The chief manufactures are creamery products, condensed milk, machine-shop products, wagons, carriages, lumber, and foundry products. The trade is principally in the manufactures of the city, farm and dairy products and live-stock. It has good schools and a fine public library which contains about 5,000 volumes. Pop. (1910) 4,410.

Monroe Doctrine. The term Monroe Doctrine has been popularly used for three different principles which at different times have governed the policy of the United States toward Latin America: they are (1) the declaration made in 1823 by President Monroe; (2) various theories of our relations to Latin-America, which theories by several presidents and secretaries of state from 1845 to 1885 have been set forth as forms of the Monroe Doctrine; (3) the general doctrine that the United States has a "paramount interest" in American affairs, a doctrine rapidly developed since 1890.

I. The original Monroe Doctrine grew out of the political conditions of America in the first quarter of the 19th century. In 1823, by a series of revolutions, Spain had lost all her American possessions except Cuba and Porto Rico; Portugal had lost Brazil; France had lost the Island of Haiti; so that England, the United States, and Russia were the only world powers which had large territories and the hope of development in the new world. Toward the dozen so-called states formed out of the ruins of the Spanish and Portuguese empires, the United States felt a natural and lively sympathy, first because most of them were in form republics, and were expected to follow the United States in maintaining popular governments; secondly because the trade of those countries, which had been as far as possible reserved by Spain, was now open to the world, and was valued by the people of the United States.

Europe, in the meantime, after the fall of Napoleon, went into the hands of a great political alliance formed by Austria, Russia, Prussia, and France, and cemented by a treaty called "The Holy Alliance" (1815); this was in effect a system of mutual political insurance, under which, in case of revolution anywhere in Europe, the forces of the allied powers could be used to put it down. A revolution in Spain in 1820 called for the intervention thus arranged in advance, and in 1823 a French army overwhelmed Spain and again placed in power the sordid tyranny of the Bourbons.

So far, the United States was not directly involved; but in 1823 the Spanish Bourbons asked the aid of the Holy Alliance to restore their authority in America; and the United States justly feared that France would undertake this commission, and would receive Cuba as the price of the service, thereby securing a new foothold in America, and a rich island almost overlooking the American coast. Just at this time a question arose as to the possession of the north-west coast of America, where Russia claimed not only a liberal stretch of coast reaching almost to San Francisco, but also the right to keep the vessels of other powers out of the north Pacific Ocean (Ukase of 4 Sept. 1821).

MONROE DOCTRINE

The leading mind in the cabinet of Monroe was not the president, but John Quincy Adams, secretary of state, who saw the great significance, both of intervention in the established Latin-American states, and also of European claims to wild territory in America. England was also interested in unrestricted trade with the Spanish-American countries, and in 1823 George Canning four times proposed to the United States to join England in a declaration against intervention, and Monroe was inclined to accept the proposal. After long cabinet discussion, Adams convinced the President that it would be better to make an independent declaration. Adams' papers show that he not only suggested but formulated most of the important presidential message of 2 Dec. 1823, several passages in which, construed together, constitute the original and genuine Monroe Doctrine. The message includes substantially the following principles: (1) Isolation: there are two spheres of world influence, separated by a meridian drawn through the Atlantic Ocean; two political world entities, with different sets of interests; and since the United States takes no part in the affairs of the European sphere, European powers ought to keep out of American affairs. (2) Colonization: "the American continents, by the free and independent condition which they have assumed and maintain, are henceforth not to be considered as subjects for future colonization by any European powers." This was directed against Russia, and specifically excepts "the existing colonies or dependencies of any European power." (3) Intervention: the message assumes that the Latin-American states are permanently independent, and capable of conducting civilized governments; and explicitly and strongly protests against "any interposition for the purpose of oppressing them, or controlling in any other manner their destiny, by any European power." (4) Political system: it would be hostile and dangerous to the United States if "the allied powers should extend their political system to any portion of either continent." This clause plainly refers to the mutual assistance given by members of the Holy Alliance. (5) John Quincy Adams undoubtedly desired that the United States should exercise a political leadership over the other American states, but such a principle is not embodied in the message.

The original Monroe Doctrine was at once effective. Canning was so much interested in the result that he claimed it for himself and said (21 Dec. 1826): "I looked another way . . . I sought for compensation in another hemisphere. . . . I called the new world into existence to redress the balance of the old."

In reality the United States had struck out a policy for itself. European intervention was abandoned; but when our Latin-American neighbors attempted to get a more distinct promise of military protection, in the Panama Congress of 1826, the United States took the ground that our neighbors must protect themselves, in case of a fight with European powers.

II. The second phase of the Monroe Doctrine began about 1845, because a new set of conditions came about in America. In 1824 and 1825 Russia withdrew all her claims on the Pacific coast south of 54° 40'; Cuba remained safe in the hands of Spain; and France soon ceased to be an important factor in American affairs. The commerce of the United States increased with

all her neighbors. Furthermore the United States assumed new importance in America by the annexation of East Florida in 1819; by the successful assertion of claims to Oregon from 1805; by the annexation of Texas in 1845; and by enormous growth of population and power. In the Mexican War, in 1846, the United States abandoned any right to stand as the special champion or defender of the integrity of Latin-American states, for we invaded and seized Mexican territory.

To meet these new conditions President Polk and other presidents and secretaries of state after him, laid down principles which they held to be a reiteration of the Monroe Doctrine. The annexation of California raised a new question of American policy, by calling attention to the need of a line of transit shorter than the 14,000 mile voyage around the Horn. In formal terms President Polk several times quoted phrases of Monroe's doctrine, and attempted to show that a policy of aggression on our neighbors was a duty prescribed by that doctrine. (Inaugural Address, 4 March 1845, message, 2 Dec. 1845.) In a special message (20 April 1848) he advocated the annexation of Yucatan, on the ground that the Monroe Doctrine required us to take over territory which otherwise might go to European powers. More significant than these appeals to Monroe was the treaty of 12 Dec. 1846 (ratified 10 June 1848), with New Granada (now Colombia), under which the United States received the right to use, and to maintain order on, any transit line by water or land across the Isthmus of Panama. Another evidence of interest in the rest of America was the Clayton-Bulwer treaty with England (19 April 1850), by which the United States agreed to share with Great Britain the responsibility of guaranteeing any Isthmus communication, and secured from Great Britain a pledge not to exercise any exclusive control over the Nicaragua route. These two ideas of a special guaranty and of a joint guaranty were clearly not covered by, nor contemplated by, Monroe's message of 1823.

A few years later, however, precisely the case which was in Monroe's mind arose. In 1861 France sent an armed force into Mexico, ostensibly to enforce claims, really, as it soon proved, to found a French dependency in America, at a time when the United States was completely occupied in civil war. Secretary Seward in his despatches several times referred to the "tradition" of the United States, to the objection to "foreign occupation," and to "attempts to control" the destinies of republics in America; but though he undoubtedly had Monroe's message in mind, he never mentioned it, probably because he thought that Seward could expound as good a doctrine as Monroe. At the end of the Civil War a large force of troops was directed to the Mexican frontier, and the French were warned by Seward that the time had come to leave the country; with great regret they obeyed the warning. An increasing sense of interest in Central America was shown by Seward's attempts to secure for the United States a foothold for our control of an Isthmus canal. Treaties were made with Honduras (4 July 1864) and with Nicaragua (21 June 1867), by which the United States was to have large rights of control over any canal constructed through either of those countries; and a treaty

MONROE DOCTRINE

with Colombia for exclusive rights of control (14 Jan. 1869) failed in the Senate. At the same time Secretary Seward enlarged the territory of the United States by the annexation of Alaska (treaty of 30 March 1867); but his two attempts to get a West Indian naval station to flank the route to the Isthmus were not successful; the Danish treaty (of 24 Oct. 1867) for the cession of Saint Thomas and Saint John was rejected by the Senate; and the negotiations with San Domingo for Samana Bay were abortive.

When General Grant came to the presidency in 1869 he and Secretary Fish revived with great vigor both lines of the previous diplomacy. In 1870 he negotiated a treaty with Colombia to give us exclusive control over a Panama canal; but it was not ratified. Into a plan for the annexation of the eastern end of the Island of San Domingo Grant threw himself with great earnestness, appealing in several special messages (31 May, 13 June, 5 Dec. 1870, 5 April 1871) to Monroe's doctrine; and Secretary Fish (14 July 1870) laid down the doctrine that the United States "occupy of necessity a prominent position on this continent . . . which entitles them to a leading voice"; but the Senate was not convinced either that the interests of the United States or the Monroe Doctrine required such an annexation.

The applicability of the Monroe Doctrine to the canal question was raised again in 1879 when it was announced that a French company had acquired a concession for a Panama canal and stood ready to build it. Secretary Evarts (8 March 1880) declared roundly that the United States "had a paramount interest" in an Isthmus canal; and President Hayes in a special message (8 March 1880) held that any canal must be "virtually a part of our coast line," and hence a matter "of paramount concern to the people of the United States." A few years later Secretary Blaine in several despatches (7 May, 24 June, 10 Nov. 1881), and Secretary Frelinghuysen (8 May 1882), repeated phrases of Monroe's message, as governing the Isthmus canal.

III. The bankruptcy of the French Panama Canal Company in 1889 somewhat relieved the pressure for the control of the canal and of its West Indian approaches; but in 1895 the Monroe Doctrine was appealed to in a novel way, as controlling a long-standing boundary controversy between Venezuela and the neighboring British colony of Guiana. The United States had repeatedly offered its good offices, and suggested arbitration; inasmuch as Great Britain took no heed, Secretary Olney (20 July 1895) protested against any attempt of a European power to extend its boundary over territory claimed by an American power, because (he said) the Monroe Doctrine provided "that no European power or combination of European powers shall forcibly deprive an American state of the right and power of self-government."

Beyond any previous enunciation of the Monroe Doctrine, Mr. Olney made the statements that "distance and 3,000 miles of intervening ocean make any permanent political union between an European and an American state unnatural and inexpedient"; and that "to-day the United States is practically sovereign on this continent, and its fiat is law upon the subjects to which it confines its interposition:" all these doctrines Mr. Olney believed to be "the

accepted public law of this country." This despatch was fortified by a message from the president (17 Dec. 1895), in which he held that "since in international councils every nation is entitled to the rights belonging to it, if the enforcement of the Monroe Doctrine is something we may justly claim it has its place in the code of international law." He hinted at war as the penalty if Great Britain declined to heed this remonstrance.

Mr. Olney's doctrine was certainly not the original Monroe Doctrine. It is really the laying down of a new principle; namely, that Great Britain, which through its possessions in Canada and the West Indies has for a century been an important American power, is no longer to exercise influence on the future of Central and South America. That lesson Great Britain took to heart, for she accepted the proposed arbitration (by which nearly all the territory in dispute was assigned to Great Britain); and in the Spanish war of 1898 Great Britain was solicitous to make it clear that she would not, and other European powers must not, interfere with the American policy of the United States. As the result of that war, the United States acquired a West Indian station in Porto Rico; and the new attitude of Great Britain led to the first Hay-Pauncefote treaty of 5 Feb. 1900, by which Great Britain agreed to give up the joint control over Isthmus transit, which was provided by the Clayton-Bulwer treaty of 1850. The new arrangement was not satisfactory to the Senate, and hence a second treaty was negotiated (18 Nov. 1901), by which the Clayton-Bulwer treaty was declared abrogated and the United States was left free to control any Isthmus canal, and to "neutralize" it in her own way.

Germany has for some years been looking eagerly about the world for an opportunity to plant colonies, and was supposed to have a special interest in the South American countries. An unofficial and unpublished understanding was reached, however, with the United States, by which Germany undertook to make no conquests or settlements in South America. Hence, in December 1902, the United States offered no objection, and made no appeal to the Monroe Doctrine, over an occupation and bombardment of the ports of Venezuela by German, English, and Italian warships; the ground taken by President Roosevelt was that the Monroe Doctrine was not intended to protect American states from responsibility for their own defiance of the principles of civilized intercourse; but it was understood that the United States would under no circumstances permit the occupation of interior American territory even for a short time.

A few months later (22 Jan. 1903) Secretary Hay negotiated a treaty with Colombia for the construction and exclusive control of a Panama canal. The treaty was rejected by the Colombian government, and (3 Nov. 1903) the people of Panama revolted and set up a new republic, which was on 13 November recognized by the United States. The leading European governments at once followed in recognizing the new power, on the evident principle that the United States was the only great power which had responsibility for the relations of Latin-American states with each other. (See PANAMA.)

The Monroe Doctrine, so-called, has thus passed through many changes, ranging from the negative idea of Monroe that the United States

was to see fair play in America, to the positive and aggressive plans of Polk and Fish, who asserted the right of the United States to enlarge at the expense of our neighbors; and thence to the broader doctrine of Olney and Hay that the United States must settle the interior affairs of America without interference from, or suggestions from, European powers. This doctrine has become a principle of American state policy which is courteously recognized by all other great powers.

ALBERT BUSHNELL HART,
Professor of History, Harvard University.

Monrovia, mún-ró'vī-ə, Liberia, the capital of the republic, a commercial and seaport town, on Cape Mesurado near the mouth of the St. Paul's River. It was named after James Monroe, President of the United States. Pop. 5,000.

Mons, mōns, Belgium, the capital of Hainault, on the Trouille, 38 miles by rail southwest of Brussels. An encircling belt of promenades occupies the site of the fortified ramparts demolished in 1862. The Canal de Condé connects Mons with the Scheldt. The church of St. Waddru (1450-1589) is a masterpiece of Gothic; and there are a town hall (1458), a belfry (1662) 275 feet high, a good library, etc. The manufactures include woolen and cotton goods, cutlery, hardware, and sugar; while in the vicinity is the extensive coal field of Borinage. Mons, occupying the site of one of Caesar's camps, was made the capital of Hainault by Charlemagne in 804. France, Spain, and Austria often contended for its possession. Pop. about 28,000.

Mons. See MEXSA.

Monseigneur, mōn-sā-nyér (French, my lord), a title of dignity in France. Before the revolution the king's oldest brother was styled *monseigneur*. Princes, dukes and peers, archbishops, bishops, cardinals, marshals of France, presidents of parliament, etc., were addressed by this title.

Monseil, mún-sēl, James Samuel Bowley, English Protestant Episcopal clergyman and hymn-writer: b. Londonderry, Ireland, 2 March 1811; d. Gullford, England, 9 April 1875. He was graduated from Trinity College, Dublin, in 1832, and took orders in the Church of England in 1835. As a writer of hymns he became famous, over 100 of his hymns still continuing in popular use. Among his publications are: 'Parish Musings'; 'Simon the Cyrenian and Other Poems'; 'Spiritual Songs'; 'Our New Vicar' (1867, 13th ed. 1890).

Monsignore, mōn-sē-nyó'rē, a title of honor given to prelates of the Roman Catholic Church. Formerly in France the corresponding

title of Monseigneur was allowed to all high dignitaries of the Church.

Monson, mún'són, Sir Edmund John, British diplomat: b. Chart Lodge, Kent, 6 Oct. 1834; d. 20 Oct. 1909. He was educated at Eton and Balliol College, Oxford; was fellow of All Souls, Oxford, 1858; had entered diplomacy in 1856; held various minor posts, as attaché or under-secretary, until 1876, when he was sent on special service to Dalmatia and Montenegro. He was minister to Uruguay (1879), to Argentina and Paraguay (1881), to Denmark (1884), to Greece (1888), and after acting as arbitrator of the Butterfield claims between Denmark and the United States in 1888, minister to Belgium 1892, ambassador to Austria 1893, and later to the French Republic. He was made a privy councillor in 1893.

Monsoons, mōn-soonz', in meteorology, are certain trade winds, operative from the tropic of Cancer to lat. 7° S, and from the coast of Africa through the Indian Ocean and the Bay of Bengal to Japan and the Western Pacific. There are two monsoons, the southwestern and the northeastern. The latter prevails from October to April, and the former from April to October. Monsoons are caused by the unequal heating of the land and water and of the several land masses themselves in the regions which they affect. Independently of their great use in bringing rain to countries which otherwise would degenerate into deserts, they are useful for navigation. As in the case of the trade winds, navigators can so plan their voyages as to take advantage of the monsoons, though powerful steamships can now achieve the feat of running in the teeth of the monsoon, but not without some discomfort to those on board.

Monsters. See TERATOLOGY.

Mon'strance (Latin, *monstrare*, to show), called also *ostensorium* or *expositorium*, the sacred vessel in which, in the Roman Catholic Church, the host is shown to the people, through a glass-covered opening, at benedictions, processions, and other solemnities. Its use dates from the institution of Corpus Christi Day (1264) by Pope Urban IV. It was not until after the Council of Cologne 1452 that the consecrated wafer was exhibited to the people, having been previously deposited in the ciborium which enclosed and concealed it.

Mont Blanc, mōn blān (white mountain), France, a mountain, the loftiest of Europe, belonging to the Pennine chain of the Alps, and rising 15,781 feet above sea-level, the main portion and the highest summit being in France (Haute Savoie), 7 miles south of the Switzerland frontier. It forms a huge mass stretching northeast and southwest, in which direction the boundary line between France and Italy runs along it. Its northeastern extremity enters Switzerland. In this latitude the snow line is at 8,000 feet; consequently 7,700 feet of the mountain are within the region of perpetual snow and ice. Its shape, when seen on the north or south, is pyramidal. On the southeast it presents an immense wall-face, on which few glaciers can be formed. These, of which 18 in all are counted, are chiefly on the northwest slope, where the glaciers Des Bossons, Bois, Talèfre, and Mer de Glace are seen. The mass of the mountain consists almost entirely of granite. In 1760

MONT CENIS -- MONTAGNARDS

Saunders offered a prize for the discovery of a practicable passage to the summit, which was reached by Jacques Balmat, a guide, June 1786. The "Grande Ascente" is now an ordinary tourist excursion, regularly made every season by great numbers, and is less hazardous than commonly supposed, unquestionably due to the precautions taken by government to ascertain the qualifications of the guides, and regulate the mode of ascent. In 1893 an observatory was erected on the summit of the mountain by Pierre Janssen.

Mont Cenis, mông sê-nê, or Monte Ceniso. See **CENIS, MONT.**

Mont Cervin, mông sêr-vân. See **CERVIN, MONT.**

Mont Pelée, mông pè-lâ. See **PELÉE, MONT.**

Mont-de-Piété, mông-dê-pê-à-tâ (in Italian *Monte di Pietà*), an authorized licensed or government pawnshop; a bank of charity which lends money on pledges at a low rate of interest, and whose aim is purely philanthropic. The chief customers of such institutions, which are found in France, Italy, Germany, and other continental countries, are workmen pressed by a temporary failure of employment; small tradesmen without a bank account; or travelers in a large town whom some accident has subjected to a momentary strait; to all of whom it is a matter of necessity to conceal any compromise of their position in procuring money for present necessities. These institutions were established to prevent the scandal and abuse of usury. They date their origin from the Middle Ages, when the loan of money on pledges was almost exclusively in the hands of the Jews. They originated in Italy about 1450, and not long after were approved by several papal bulls. Several French and Italian cities possessed *monts-de-piété* in the latter half of the 15th century, among others, Mantua, Parma, Milan, Rome, Padua, Trèves, Boulogne, etc. The French *monts-de-piété*, with the exception of those of Montpellier, Toulouse, Grenoble, and Angers, which lend without interest, exact interest at the rate of from 4 to 12 per cent. The chief *mont-de-piété* in France is that of Paris, which transacts a greater amount of business than all the rest together. It is said to receive in pledge as many as 1,000 to 1,200 watches a day. In the United States and Great Britain pawnbrokers take the place of *monts-de-piété*, which were introduced in the beginning of the 18th century, but failed. See also **PAWN-BROKERS.**

Mont-Saint-Michel, mông-sân-mê-shêl, France, a famous seat of learning and pilgrimage resort of Normandy as early as the 12th century, now an equally celebrated tourist resort. It consists of a collection of mediæval houses, hostels, ecclesiastical buildings, and fortifications, grouped on a conical rock in the Bay of Cancale or Saint Michel, at the mouth of the Couesnon River, here forming the boundary between Normandy and Brittany, 15 miles southeast of Granville. Anciently a lofty hill in the Forest of Scissy which was submerged in the 7th century by a tidal cataclysm, the rock in prehistoric times was crowned by a Celtic temple; it was the Roman *Mons Tumbæ*, and the "*mons in periculo maris*"—the mount in danger of the sea—of the monastic chroniclers. The Bay of Saint Michel, 15 miles wide at its mouth, and 8

miles long from north to south, is nearly dry at low water, but fills with treacherous rapidity at flood tide. In 1880 a dyke nearly a mile long was completed which connects the Mont with the mainland. Ramparts, towers, and bastions of the 16th century encircle the base of the rock which has a circuit of about two miles, and the entrance is through a gate which opens on the single, narrow, winding street of a small village (pop. 1901, 235) built around the southern slope and leading by several flights of stone steps to the fortified abbey on the summit. Crowning the abbey is a superb 15th century Gothic church, a fine statue of the Archangel Michael capping the spire, which towers conspicuously 250 feet above the wide expanse of sandy bay and low-lying country around. Saint Aubert, bishop of Avranches, founded the abbey in 709 and his first chapel, restored, is on a rocky projection on the north side of the Mont. In 1203 the abbey was destroyed by Philip Augustus, and the present buildings date from that period. It was an important fortified post during the English and religious wars and was successfully defended against all assaults by the Knights of the Order of Saint Michael. At the Revolution it was converted into a prison for political offenders, and now ranks as one of the protected historical monuments of France. An elaborate process of restoration extending over several years is gradually renewing its ancient strength and beauty. Among the chief features of the Mont are the abbey church, elaborately decorated cloisters, La Merveille "the marvel," or massive north wall of the abbey, the Salle des Chevaliers, the Châtelet or guard house, the crypts with their remarkable columns, the cellars, the dungeons, the mediæval elevator with its enormous hoisting wheel formerly operated by a donkey, etc.; and in the village the ancient parish church, a museum, the famous Porte du Roi, and Duguesclin's Tower.

CHARLES LEONARD-STUART, B.A.,
Editorial Staff, 'Encyclopedia Americana.'

Montagna, Bartolommeo, bār-tô-lôm-mâ'ô mông-tan'yâ, Italian painter. b. Orzinovi, near Brescia, about 1450; d. Vicenza 11 Oct. 1523. He settled at Vicenza in 1480, was influenced by Bellini, Carpaccio and Andrea Mantegna, worked in Padua and Verona, and from 1496 until his death was again in Vicenza, being the first great master resident there. His work in general resembles the earlier Venetian school, is serious, marked by distinctness, power and severity of drawing, and has harmonious coloring in which a brown gleaming tint is noticeable. The human form is almost always shown as over-muscular. His principal works are the 'Madonna and Child' at the Venice Academy, 'Ecce Homo' at the Louvre, and frescoes in the church of San Nazaro at Verona.

Montagnais (mông-tân-yâ) Indiana, a general name applied to several American Indian tribes. One of these was of the Athapascan family in British North America, the most of whom were Christianized by Roman Catholic missionaries. Another and the best known tribe of this name, was of the Algonquian family, and resided along the shores of the Saint Lawrence River. They have practically disappeared in recent years.

Montagnards, mông-tân-yâr, a popular name in French history, applied in 1793 to the

MONTAGU—MONTAIGNE

extreme democratic party. Soon after the fall of Robespierre the denominations of "Montagnard" and "Montagne" gradually disappeared from party nomenclature. An attempt was made by the extreme party in the National Assembly, after the revolution of 1848, to revive the title, but it was a pure anachronism.

Montagu, mōn'tā-gū, Andrew Jackson, American lawyer and politician: b. Campbell County, Va., 3 Oct. 1862. He was graduated from Richmond College in 1882 and studied law taking the degree of B.L. at the University of Virginia. He was admitted to the bar and began the practice of law in 1885; from 1894 to 1898 he was United States district attorney for the western district of Virginia, and in 1898-1902 attorney-general of the State. In 1902 he was elected governor of Virginia for a term of four years. He has been one of the foremost advocates of direct primaries to prevent party machine rule. He has also been active in the movement for improved popular education in the South, and has given many public addresses throughout the State, advocating the increase of educational facilities for all without regard to race or creed.

Montagu, Elizabeth Robinson, English author and society leader: b. York 2 Oct. 1720; d. London 25 Aug. 1800. In 1742 she married Edward Montagu, grandson of the first Earl of Sandwich, who died leaving her a fortune. To wealth she added literary accomplishments, and these, joined to other personal qualities, enabled her to secure her social leadership. Among her visitors and associates were Lord Lyttelton, Samuel Johnson, Horace Walpole, Burke, Sir Joshua Reynolds, Garrick, Hannah More, and other celebrated persons. To the gatherings at her house the term blue-stocking (q.v.) is said to have been first applied. Three of the dialogues in Lord Lyttelton's 'Dialogues of the Dead' were written by her in 1760. She also wrote an 'Essay on the Writings and Genius of Shakespeare, compared with the Greek and French Dramatic Poets' (1769). Much of her correspondence was published (1809-13). Consult the 'Memoirs' of Elizabeth Carter (1816), and Doran, 'A Lady of the Last Century' (1873).

Montagu, Lady Mary Wortley, English author: b. 1689; d. 21 Aug. 1762. She was the eldest daughter of Evelyn Pierrepont, afterward Duke of Kingston. She learned Latin very early, and also became versed in English literature, especially its romance and drama. The Kit-Cat Club (q.v.) by acclamation admitted her to membership. In 1712, without the consent of her father, she married Edward Wortley Montagu, a wealthy Whig scholar, with whom the former had quarreled. On the accession of George I. in 1714 Montagu obtained an official position in London, and Lady Mary came out from the seclusion in which she had lived. Her beauty, wit, and vivacity gained her admiration and influence, and she became familiarly acquainted with Addison, Congreve, Pope, and other distinguished writers. In 1716 her husband was appointed ambassador to Turkey, and Lady Mary accompanied him to Constantinople, where they remained from January 1717 to May 1718. During this period her famous 'Turkish Letters' were written. On her return to Eng-

land she re-entered the world of wit and fashion. She had a quarrel with Pope, and a long and keen literary war ensued, which did honor to neither. In 1739, for reasons never satisfactorily explained, she left England to live on the Continent. Thus she did with the full concurrence of her husband. She lived chiefly in Italy until her husband's death in 1761, and soon after her return to England she herself died. Her letters are marked by great sprightliness, combined with graphic power and keen observation, and with independence of judgment. Lady Mary has another claim to remembrance in her courageous adoption for her own children of the Turkish practice of inoculation (q.v.) for small-pox, and for her energy in promoting its introduction into England, in the face of violent prejudice. Consult her 'Works,' edited by Lord Wharnccliffe, her great-grandson (1837, latest ed. 1893).

Montague, Mass., a town including several villages, in Franklin County; on the Connecticut River, and on the Central Vermont and the Fitchburg railroads; about 35 miles north of Springfield. The most important village in the town is Turner's Falls. Montague was settled about 1716 and in 1753 was incorporated as a district. It is in an agricultural and manufacturing region. The chief industrial establishments are large cotton mills, paper and pulp mills, brick, water-wheels, hardware, cutlery, pumps, toilet articles, soap, and machinery. There are two public libraries. The government of the town is determined by popular vote at regular town meetings. Pop. (1890) 6,296; (1900) 6,150; (1910) 6,866.

Montaigne, mōn-tān' (Fr. mōn-tān-yē), Michel Eyquem de, French essayist: b. Château Montaigne, Périgord, 28 March 1533; d. there 11 Sept. 1592. He was educated by his father after a fashion all his own, learning Latin from house servants who never spoke French and being roused from bed every morning by soft music. At six he was sent to the Collège de Guyenne in Bordeaux, where he stayed for seven years apparently under the charge of the great classical scholars Buchanan and Muretus. Thereafter he probably studied law at Bordeaux and Toulouse, and when he came of age was made a member of the Cour des Aides at Périgueux. This court was abolished three years afterward and Montaigne with the other members was appointed counselor to the Bordeaux parliament, a body in which he made the acquaintance of La Boétie about 1559. For the next few years he was at court now at Paris, now at Bar-le-Duc; we know that in 1562 he swore allegiance to the Catholic Church on his own motion, that in 1565 he married Françoise de La Chassaigne, daughter of one of his fellow counsellors, and that the death of La Boétie in 1563 and that of his father in 1568 had greatly lessened Montaigne's interest in public affairs. These events had also no doubt sobered him—he admits that his youth had been wild; at any rate in 1571, having prepared La Boétie's posthumous works for the press, having received himself the order of St. Michel for a rather mediocre version of the 'Theologia Naturalis' of Raymond de Sebonde, his only literary venture so far, after selling his post as counsellor, he retired to Montaigne. There he began, and in the next nine years com-

MONTALEMBERT

pleted, the first two books of his essays, whether purposing them for publication or not is unknown, though their style seems to point to the fact that in their earliest form they must have been mere jottings in a commonplace book. By the middle of 1580 his health had so much failed that he left Château Montaigne for the first time since 1571, save for an occasional trip to Paris, and traveled through Switzerland, Germany, and Italy, meeting Tasso at Florence. His 'Journal' of this trip, discovered and published in 1774, adds nothing to his literary fame and not much more to our knowledge of his personality. During this absence from France, and apparently quite against his will, Montaigne was elected mayor of Bordeaux; he served in this office from 1581 to 1583 and then was re-elected for another two years; at the close of this successful administration, in which with no small skill he had steered safely the king's lieutenant in Guyenne and the king of Navarre, governor of the province, he refused to be present in the city as was required for the election of his successor, because of the plague—one of the few lights on his personal character and not a pleasant one. The three years immediately following (1585-8) were occupied in the revision of his two books of essays and the addition of a third. He received the rites of the Church upon his death-bed. His wife bore him several children; "two or three," he says, died in infancy, and one, a daughter of whom he was very fond, survived him. But his family ties were not strong; his life with his wife seems to have been a philosophic makeshift, and his love for his daughter can not compare with his attachment to a Parisian girl, Mlle. de Gournay, who was attracted to him by his literary fame, was called by him his adopted daughter, and was fortunate enough to receive from Montaigne's widow a copy of his 'Essays' with manuscript additions and corrections, the basis of a new edition, published in 1595. Montaigne's literary reputation is safe, though in the hands of the few, not the many. His spirit is skeptical, essentially typical of his time, and it was not for nothing that his study at Château Montaigne was decorated with texts from Ecclesiastes, Ecclesiasticus, Lucretius and Horace, for he was akin to these ancient writers who proclaim the vanity of all things. His theme is varied, his treatment discursive, and his charm largely due to this very variety, together with a quaintness and raciness of style that did much for French prose and was mostly original even if patterned on Amyot. His manner of approaching the questions of life and criticism is apparently purely subjective; indeed, his delightful egotism that makes his own life, experiences, and thoughts the theme of the essays seems at first to be quite independent of so serious a purpose. But this subjective manner brings him nearly as close to the analysis of universal problems as does the dramatic objectivity of a Shakespeare. His entire attitude is skeptical, but he is not to be ranked as the enemy of religion. He is the curious, interested skeptic, not the doubting cynic. Prof. Saintsbury well says that the nearest spiritual parallel to Montaigne in literature is Charles Lamb.

Montaigne affected English literature scarcely less than he did French. His essays, translated by Florio (1603), seem to have been known to Shakespeare in their English form, and this

same version, revised by Hazlitt (1809), is still the standard in English. The best editions of the original are those by Amaury-Duval (1820) and Le Clerc (1865). Consult the appreciations by Emerson, 'Representative Men' (1890); Church, 'Miscellaneous Essays' (1888); Pattison, 'Essays' (1889), and Pater, 'Gaston de Latour' (1896); also Bonneton, 'Montaigne et ses Amis' (1892), Stapfer, 'Montaigne' (1894); Lowndes, 'Michel de Montaigne' (1898); Guizot, 'Montaigne' (1899); Champion, 'Introduction aux Essais de Montaigne' (1900).

Montalembert, Charles Forbes de Tryon, shārl fōrb də trē-ōn mōn-tā-lōn-bār, COMTE DE, French publicist and historian: b. London, England, 29 May 1810; d. Paris 13 March 1870. He received a university education at Paris; identified himself with the Liberal Catholic movement of Lamennais (q.v.) and Lacordaire (q.v.), whom he assisted in establishing (18 Oct. 1830) and editing 'L'Avenir' and in efforts to obtain the freedom of education at that time impossible under the state system, and in 1831 went with these two leaders to Rome to present their cause. On his return he opened with Lacordaire and De Caux at Paris a free Catholic school, which was promptly closed by the police, while the directors were arraigned for infringement of the laws respecting instruction. Montalembert made a notable defense before the Chamber of Peers, but the directors were sentenced to pay the costs and 100 francs apiece in fines. When the doctrines of 'L'Avenir' were condemned by Gregory XVI. in an encyclical of 15 Aug. 1832, Montalembert duly submitted and did not proceed with Lamennais to final revolt. He entered the Chamber of Peers in 1835, spoke much and eloquently on ecclesiastical matters, and in 1836 published his 'Histoire de Sainte Elizabeth de Hongrie,' which appeared in an English rendering by Hackett and Sadlier (1854). His Catholic zeal was combined with liberal ideas and after the revolution of 1848 he was elected as a Moderate Republican to the Constituent Assembly; but here, as in the Legislative Assembly, where he sat from 1849 to 1857, he became more and more conservative. In June 1851 he debated against Victor Hugo in opposition to the proposed constitutional revision. He found himself unable to support the measures of the Empire; was known as one of the most determined opponents of Napoleon III.; and for an article, 'Un Débat sur l'Inde au Parlement Anglais,' unfavorably contrasting French and British institutions, was sentenced to six months' imprisonment and a fine of 3,000 francs, though the penalty was remitted. His chief work is 'Les Moines d'Occident depuis St Benoît jusqu'à St. Bernard' (1860-7; Eng. trans.), which, though of much value, has been criticized as in general too argumentative and oratorical in manner to fulfil the highest demands of history. He wrote many pamphlets, the last of which, 'La Victoire du Nord aux Etats-Unis' (1865; Eng. 1866), was an appreciation of the triumph of the Union cause in the Civil War. He opposed in a letter of 28 Feb. 1870 the opportuneness of the definition of the doctrine of Papal infallibility, but acquiesced at once when the dogma was published. Consult the memoir by Mrs. Oliphant (1872), the study by De Meaux (1897); Craven, 'Le Comte de Montalembert' (1873).

MONTANA

Montana, mŏn-tā'na, the "Treasure State" (admitted to the Union 8 Nov. 1889), is bounded north by British Possessions, east by North Dakota and South Dakota, south by Wyoming and eastern Idaho, west by Idaho. Capital, Helena; area, 146,080 square miles (about 1,000 of it water); population (1910) 376,053, including about 11,000 Indians and 5,000 Chinese, Japanese, and Negroes.

Topography.—The State has within its borders 93,491,200 acres of land. Of this amount about 26,000,000 acres are classed as mountain lands, 30,000,000 as farming lands, and 38,000,000 as grazing lands. This is approximately 40,000 square miles of mountains, 50,000 square miles of farming lands and 56,000 square miles of grazing lands. The mountain area of the State is about equal to the area of either Indiana, Kentucky, Virginia, Ohio or Tennessee; its grazing land is more than the area of either Pennsylvania, Louisiana, Mississippi or New York; its farming land is as much as the area of either Wisconsin, Iowa, Illinois or Michigan. The mountain area is largely in the western part. The main range of the Rocky Mountains enters the State about a hundred miles east of the State line, and extends across the State from northwest to southeast, forming the boundary line between Montana and Idaho for several hundred miles—from 114th meridian to the Yellowstone Park. The crest of the range is quite tortuous, and contains many peaks. West of the main range of the Rockies are several smaller ranges. The Bitter-Root Mountains form a large part of the boundary between Montana and Idaho, from 49th parallel to juncture with the main range of the Rockies. The northern portion of the State west of the main range includes the Kootenais, which extend northward into the British Possessions. Between the Kootenais and the Bitter-Root range are the Cabinet Mountains, extending approximately southeast and northwest, continuing westward into Idaho. They form the western boundary of the Flathead Indian reservation, the lower summits blending with the Mission range near Missoula. The Mission range extends almost due north and south for about a hundred miles, the northern end beginning in the valley at the upper end of the Flathead lake, rising higher and higher toward the south, culminating in the McDonald Peak (9,800 feet), Sinyaleamin Peak (9,500 feet), and McLeod Peak (8,500 feet). East of the Mission range lies the Swan range, extending almost parallel with the former, and continuing some 30 or 40 miles farther north. Like the Mission Mountains, the Swan range is highest at the southern end, culminating in Swan Peak (10,000 feet). East of the main range are many smaller ranges, foothills leading from the Great Plains to the Continental divide, with its high and snowy peaks. The Big Belt Mountains form the boundary between Meagher County on the east side, and Broadwater and Lewis and Clarke counties on the west. The range extends northwest and southeast for more than a hundred miles. In the southwest angle of the State, adjacent to the National Park, are many small ranges, including the Ruby Mountains, the Tobacco-Root range, the Snow-Crest range, the Madison range, the South-Boulder range, the Gallatin range, Bridger Mountains and Snow Mountains. Near the Wyoming line on the south is the small Bear-

Tooth range, the Prior Mountains, the Rosebud range, with a high plateau in the southeast corner. The Little Belt Mountains form a large portion of the boundary between Meagher County and Fergus and Cascade counties. Between this range and the Big Belts lie the small Dry-Range and Elk Mountains, while the Crazyes are further to the southeast, and are the first high summits to greet the traveler on the Northern Pacific railroad as he speeds westward between Big-Timber and Livingston. Fergus County, in the central part of the State, is as large as the State of Massachusetts. It contains the Big Snowy and Little Snowy ranges and the Moccasin Mountains. North of the Missouri River the State is largely a great plain, broken by the Bear-Paw range, culminating in Mount Garfield (5,794 feet), and the Cherry Patch hills at the northern boundary. The mountains contain many high peaks, the more lofty being in the Yellowstone Park (q.v.) region. Much of the mountainous region is yet unexplored save by the hardy trapper and prospector. The transcontinental railroads give the traveler a poor idea of the sublimity of the scenery which the many mountain ranges afford. Many of the snow-clad peaks bear on their sides the remnants of glaciers with miles of blue ice with huge crevasses, where the Alpine climber may find untrodden and unnamed fields, where the blue lakes reflect the azure depths of heaven, and where the botanist, the zoologist, the geologist, as well as the artist, may find a virgin field. Many of the peaks, lakes, glaciers and creeks are unnamed. Some of the more important summits, other than those mentioned, are the following: Mount Powell, Deer Lodge County, 12,000; Chief Mountain, 10,000; Mount Lo Lo, Bitter-Root range, 9,500; Saint Mary, Bitter-Root range, 9,500; Electric Peak, near the Park, 11,155; G. N., 10,000; Gallatin, 10,967. The greater portion of the State lies east of the Rockies. Most of this section may be classed with the Great Plains region, traversed as it is by the mighty Missouri and its tributaries. Part of this Great Plains portion of the State is high and rolling, eminently adapted for grazing; but a large portion is adapted to farming, when irrigated, and will supply farms and homes for thousands of families in the years to come.

River Systems.—The waters from the mountains of Montana are carried by different river systems to the three oceans, the Arctic, the Pacific, and the Atlantic through the Gulf of Mexico. In the western part the Bitter-Root River gathers the waters from the snow crests of the Bitter-Root range and from the spurs of the Rockies, and unites with the Missoula near the city of Missoula. The Missoula River through its various tributaries gathers the waters from a large portion of the western slope of the main range, including that which is used in the great smelters of Anaconda, and that which comes from the rich mines of Butte. Further north, the North Fork, Middle Fork, and South Fork of Flathead River, receive the drainage from the Mission and Swan ranges, the west slope of the main range, and a part of the Kootenais. These unite to form the Flathead River, which first pours its waters into the greatest reservoir of the State, Flathead Lake, and later joins the Missoula in the beautiful but narrow Paradise Valley to form Clarke's Fork of the Columbia. The Kootenai River

MONTANA

takes the drainage from the extreme northwest corner, a part of the Columbia drainage system. The rivers on this western side are clear and swift, with rocky and picturesque cañons. The Belly and Saint Mary rivers in the northern part of the main range carry the ice cold water from the glaciers of the Chief Mountain and the region adjacent on to the Arctic Ocean. The sources of these two rivers are in the wildest and most picturesque portion of the State. If the plans of the National Government are executed, much of the waters from the Saint Mary will be diverted to the Milk River, and used in the vast system of irrigation under contemplation. Mount Stimpson (10,000) claims the proud distinction of sending its waters to three oceans. By far the greater portion of the State is in the Missouri River drainage system. The Madison, Gallatin and Jefferson rivers gather the waters from the many small ranges adjacent to the Park and unite at Three-Forks to form the Missouri. Near the city of Great Falls are the "Falls of the Missouri," from which place the river is navigable to its juncture with the Mississippi. The Yellowstone River rises in Yellowstone Lake in the Park, and after taking its two mighty leaps in the Park and flowing through its magnificent gorge, it emerges as a restless river, continuing in swift descent until its waters merge with the muddy Missouri. The Yellowstone is the most rapid navigable stream in the world. From the north the Missouri receives the waters of the Marias, Teton, Sun and Milk rivers, all of which flow through valleys of great fertility. The scenery along the rivers is varied, and exhibits some striking antitheses. The valley of the Bitter-Root is one of remarkable beauty. The river, as it winds back and forth like a stream of silver, when viewed from Mount Lo Lo, Ward's Peak, or Saint Mary's in the Bitter-Root range, is probably equaled in quiet and peaceful grandeur only by the Yellowstone as it flows through Hayden Valley in the Park. The three branches of the Flathead present to the few travelers along their course many gorges and cañons. The South Fork in one place in the Lewis and Clarke forest reserve has cut its way through solid rock, making a cañon so narrow that pack horses may be and are forced to leap from brink to brink, while the river seethes and boils many feet below, its ominous roar announcing certain death if the leap is short. The Missouri has made the famous "Gateway of the Mountains," its splendor first told by Lewis and Clarke, and later made famous by the brush of artists. At the city of Great Falls, it hastens its speed before tumbling over the beautiful Black Eagle falls, spanned by a bridge on the Great Northern railroad, and does not diminish its speed until the bottom of the Great Falls is reached. The valleys of these rivers and their smaller tributaries make rich farming soil, suitable for grain, vegetables, and fruit. The Bitter-Root Valley in the west was settled first, and is a great farming and fruit raising region. The country adjacent to Flathead Lake is thickly settled, and produces abundant harvests without irrigation. The Gallatin Valley has become famous for its bountiful harvests, and the Yellowstone is being largely used for agriculture and fruit. The northern tributaries of the Missouri, while watering very fertile valleys, are in a thinly settled region.
